Oxygen XML Editor 26.1

User Guide

Contents

1.

Introduction

Welcome to the User Manual of Oxygen XML Editor 26.1.

Oxygen XML Editor is a cross-platform application designed to accommodate all of your XML editing, authoring, developing, and publishing needs. It is the best XML editor available for document development using structured mark-up languages such as XML, XSD, Relax NG, XSL, DTD. It is a comprehensive solution for authors who want to edit XML documents visually, with or without extensive knowledge about XML and XML-related technologies. The WYSIWYG-like editor is driven by CSS stylesheets associated with the XML documents and offers many innovative, user-friendly authoring features that make XML authoring easy and powerful.

It offers developers and authors a powerful **Integrated Development Environment** and the intuitive **Graphical User Interface** of Oxygen XML Editor is easy to use and provides robust functionality for content editing, project management, and validation of structured mark-up sources. Coupled with *XSLT* and *FOP* transformation technologies, Oxygen XML Editor offers support for generating output to multiple target formats, including: *PDF*, *PS*, *TXT*, *HTML*, *JavaHelp*, *WebHelp*, and *XML*.

This user guide is focused on describing features, functionality, the application interface, and to help you quickly get started. It also includes a vast amount of advanced technical information and instructional topics that are designed to teach you how to use Oxygen XML Editor to accomplish your tasks. It is assumed that you are familiar with the use of your operating system and the concepts related to XML technologies and structured mark-up.

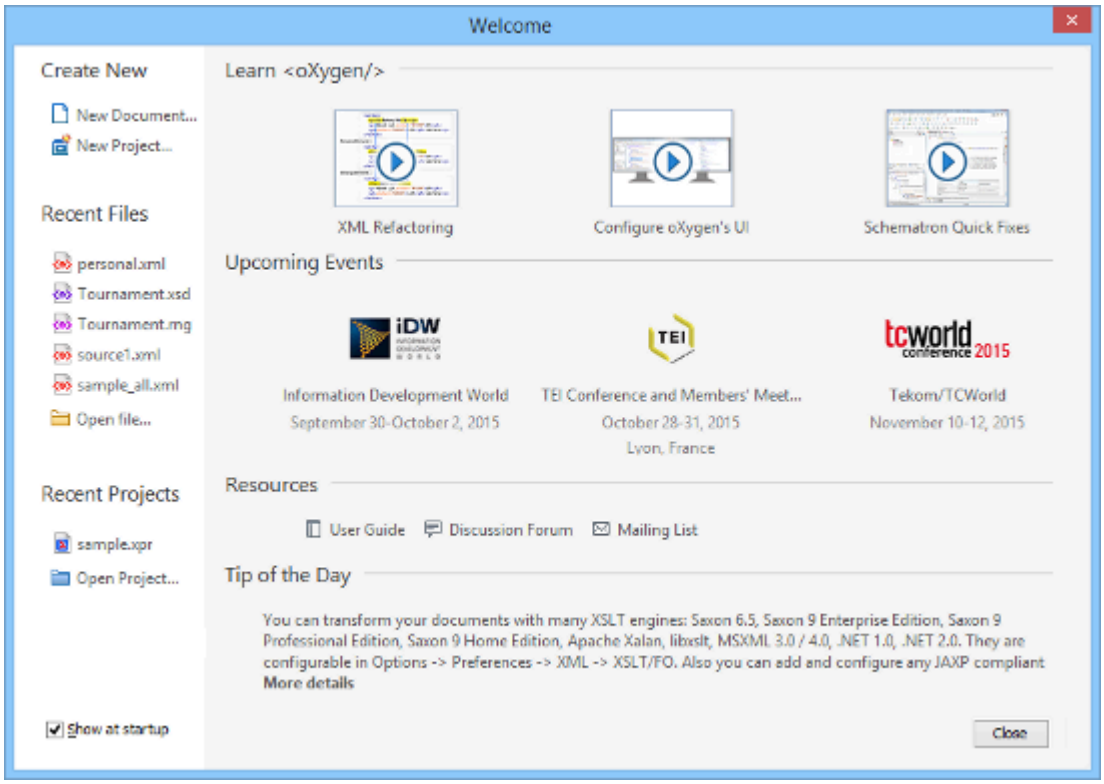
2.

Getting Started

This section provides a variety of resources to help you get the most out of the application. Typically, the first step of getting started with Oxygen XML Editor would be to install the software. For detailed information about that process, see the Installation chapter *(on page 88)*.

After installation, when you launch Oxygen XML Editor for the first time, you are greeted with a **Welcome** dialog box. It presents upcoming events, useful video demonstrations, helpful resources, the tip of the day, and also gives you easy access to recently used files and projects and to create new ones.

Figure 1. Welcome Dialog Box



If you do not want it to be displayed every time you launch Oxygen XML Editor, deselect the **Show at startup** option in the bottom-left corner of the dialog box. To display it any time, go to **Help > Welcome**.

What is Oxygen XML Editor

Oxygen XML Editor is the best XML editor available and is a complete XML development and authoring solution. It is designed to accommodate a large number of users, ranging from beginners to XML experts. It is the only XML tool that supports all of the XML schema languages and provides a large variety of powerful tools for editing and publishing XML documents.

You can use Oxygen XML Editor to work with most XML-based standards and technologies. It is a cross-platform application available on all the major operating systems (Windows, macOS, Linux, Solaris) and can be used either as a standalone application or as an Eclipse plugin.

For a list of many of the features and technologies that are included in Oxygen XML Editor, see the Oxygen Website.

Getting Familiar with the Interface

Oxygen XML Editor includes several *perspectives (on page 3422)* and editing modes *(on page 362)* to help you accomplish a wide range of tasks. Each *perspective* and editing mode also includes a large variety of helper views, menu actions, toolbars, and contextual menu functions.

There are various ways that you can configure the layout of the views or editors *(on page 369)*, and you can customize the toolbars *(on page 374)*.

Regardless of the *perspective (on page 3422)* or editing mode that you are working with, the default layout consists of the following areas:

Menus

Menu-driven access to all the features and functions available in Oxygen XML Editor. Most of the menus are common for all types of documents, but Oxygen XML Editor also includes some context-sensitive and *framework*-specific menus and actions that are only available for a specific context or type of document.

Toolbars

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all *perspectives*, editing modes, and types of documents, while others are specific to the particular *perspective* or mode. Some toolbars are also *framework*-specific, depending on the type of document that is being edited. All the toolbars can be configured *(on page 374)* to suit your specific needs.

Helper Views

Oxygen XML Editor includes a large variety of *dockable (on page 3418)* views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most commonly used views for each *perspective* and editing mode are displayed by default and you can choose to display others to suit your specific needs. The layout of the views can also be configured *(on page 369)* according to your preferences.

Editor Pane

The main editing area in the center of the application. Each editing mode provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each editing mode also includes various contextual menu actions and other features to help streamline your editing tasks. Each file that has been opened has a

tab at the top of the editing pane and there are several ways to switch between tabs or move them *(on page 403)*.

Perspectives

Oxygen XML Editor includes several different *perspectives (on page 353)* that you can use to work with your documents. The **Editor** *perspective* is the most commonly used *perspective* used for displaying and editing the content of your XML documents, and it is the default *perspective* when you start Oxygen XML Editor for the first time. Oxygen XML Editor also includes a **Database** *perspective* that allows you to manage databases and their connections and a few debugging *perspectives* that allow you to detect problems in XSLT or XQuery transformations.

Status Bar

The status bar at the bottom of the application contains some useful information when you are working with documents. It includes the following information, in the order it is displayed from left to right:

- The path of the current document.
- The *Unicode* value *(on page 473)* for the character directly to the right of the current cursor position.
- The status of the current document. The status of **Modified** is displayed for documents that have not yet been saved. Otherwise, this section is left blank.
- In **Text** editing mode, the current line and character position is displayed.
- If the **Check for notifications** option *(on page 133)* is selected, this section will show you when new messages have been received. The types of messages include the addition of new videos on the Oxygen XML Editor website, the announcement of upcoming webinars and conferences where the Oxygen XML Editor team will participate, and more.
- The memory consumption, including the memory used by the application and the maximum amount that is allocated to the application.
- If the **Show memory status** option *(on page 135)* is selected, a **Free unused memory** icon is displayed in the bottom-right corner and you can use this icon to free up unused memory.

Supported Document Types

You can use the main editing pane in Oxygen XML Editor to edit a large variety of document types.

The supported document types include the following:

- - XML documents
- - XSLT stylesheets
- - XML Schema
- - DTD (Document Type Definition) schemas
- - RELAX NG full syntax schemas
- - RELAX NG compact syntax schemas

- - NVDL (Namespace-based Validation Dispatching Language) schemas
- - XSL:FO documents
- - XQuery documents
- - WSDL documents (Deprecated)
- - Schematron documents
- - JavaScript documents
- - Python documents
- - CSS documents
- - LESS documents
- - XProc scripts
- - SQL documents
- - JSON documents
- - JSON Schema documents
- - YAML documents
- - Ant build scripts
- - Markdown documents
- Additional supported document types include: Text, Java, Properties, Batch, Shell, PowerShell, Dockerfile, and PHP.

Resources to Help You Get Started Using Oxygen XML Editor

Configuring Oxygen XML Editor

There are numerous ways that you can configure Oxygen XML Editor to accommodate your specific needs.

See the Configuring Oxygen section *(on page 131)* for details on the various ways that you can configure the application and its features.

Video Tutorials and Webinars

The Oxygen XML Editor website includes numerous video demonstrations and webinars that present many of the features that are available in Oxygen XML Editor and show you how to complete specific tasks or how to use the various features.

Go to the **Oxygen Videos** page to see the list of video tutorials.

Go to the **Oxygen Events** page to see all the upcoming and past webinars, conferences, and other events.

Oxygen XML Editor Documentation

The Oxygen XML Editor documentation includes a plethora of sections and topics to provide you with a variety of information, ranging from basic authoring tasks to advanced developer techniques. You can, of course, search through the documentation using standard search mechanisms, but you can also place the cursor in any particular position in the interface and use the **F1** key to open a dialog box that presents a section in the

documentation that is appropriate for the context of the current cursor position. Aside from the other topics in this *Getting Started* section, the following are links to other sections of the documentation that might be helpful for your specific needs:

- **Text Editing Mode Section** ***(on page 362)*** - Provides information about the **Text** editor.
- **Author Editing Mode Section** ***(on page 363)*** - Provides information about the visual WYSIWYG-like **Author** editing mode.
- **XML Schema Diagram Editor** *(on page 364)* - Provides information about the schema design mode.
- **Editing Specific Document Types Chapter** ***(on page 526)*** - Includes information about editing numerous different types of documents.
- **DITA Authoring Chapter** ***(on page 3062)*** - Provides information about using DITA to edit and structure your content.
- **Publishing Chapter** *(on page 1470)* - Provides information about the various ways that you can publish content.
- **Importing Data Chapter** ***(on page 2205)*** - Provides information about importing data from text files, MS Excel files, database data, and HTML files.
- **Tools Chapter** *(on page 2740)* - Details about the various built-in tools that are available in Oxygen XML Editor.
- **Add-ons Chapter** *(on page 2635)* - Information about how to extend the functionality of Oxygen XML Editor through add-ons.

Sample Documents

Your installation of Oxygen XML Editor includes a large variety of sample documents and projects that you can use as templates to get started and to experiment with the various features and technologies. They are located in the **samples** folder that is located in the installation directory of Oxygen XML Editor. You will find files and folders for various types of documents, including the following:

- **Sample project file (`sample.xpr`)** - A sample project file that will allow you to experiment with how projects can be structured and used. When you open this project file, you will be able to see all the sample files and folders in the **Project** view *(on page 413)*.
- **Sample files** ***(personal.xml, etc.)*** - A collection of interrelated sample files that will allow you to experiment with the structure and relationship between files, stylesheets, and schemas.
- **Various document type folders** - The various folders contain sample files for numerous document types, such as CSS, DITA, DocBook, ePub, TEI, XHTML, and many others.

Other Resources

The following list includes links to various other resources that will help you get started using the features of Oxygen XML Editor:

- See the Oxygen XML Editor Blog Site for a large variety of current and archived blogs regarding numerous features, requests, and instructional topics.
- Take advantage of the Oxygen XML Editor Forum to see various announcements and learn more about specific issues that other users have experienced.
- If you are using DITA, see the incredibly helpful DITA Style Guide Best Practices for Authors.
- To learn about the WebHelp features in Oxygen XML Editor, see the Publishing DITA and DocBook to WebHelp section of the website.
- For more information about various additional tools that are integrated into Oxygen XML Editor, see the Tools section *(on page 2740)*.
- See the External Resource Page for links to various other helpful resources, such as discussion lists, external tutorials, and more.
- See the Oxygen SDK section for details about the SDK that allows you to extend and develop Oxygen XML Editor *frameworks (on page 3420)* and *plugins (on page 3422)*, and to integrate Eclipse plugins.
- For a list of new features that were implemented in the latest version of Oxygen XML Editor, see the What's New Section on the website.
- You can select the **Tip of the Day** *(on page 53)* action in the **Help** menu *(on page 51)* to display a dialog box that includes a variety of tips for using Oxygen XML Editor.
- You can select **Show Dynamic Help view** *(on page 52)* from the **Help** menu *(on page 51)* to dynamically opens a topic that is relevant to the focused editor, view, or dialog box.

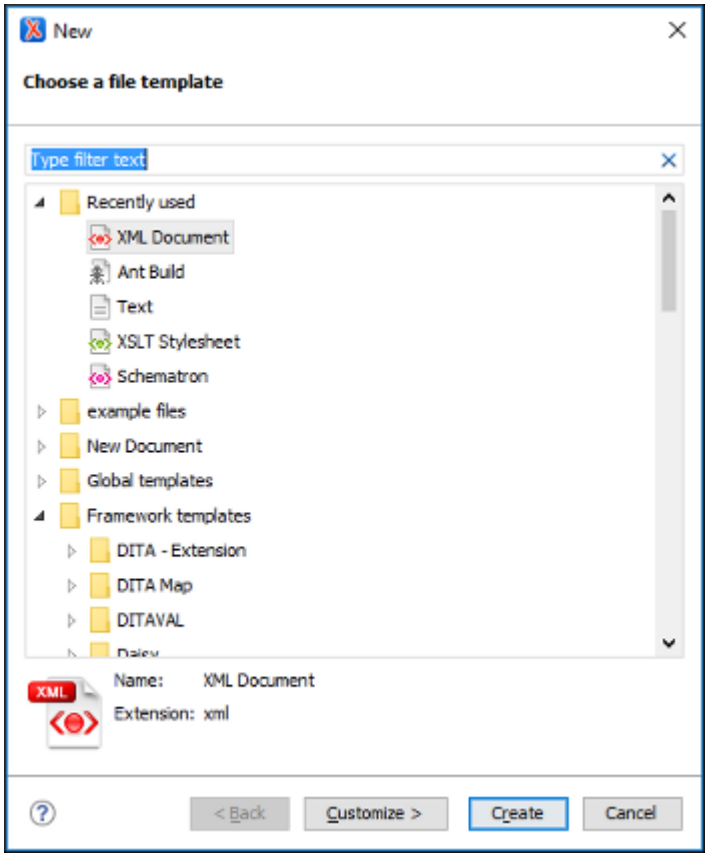
Your First Document or Project

This section includes several topics that will help you get started with your first document or project.

Your First XML Document

To create your first XML document, select **File >**  **New** or click the  **New** button on the toolbar. The **New** document wizard *(on page 377)* is displayed:

Figure 2. New Document Wizard



You can either create a new XML document from scratch by choosing one of the available types in the wizard. You can also create one from a template by choosing a template from the **Global templates** or **Framework templates** folders. If you are looking for a common document type, such as DITA or DocBook, you can find templates for these document types in the **Framework templates** folder. If your company has created its own templates, you can also find them there. After you use this dialog box to create a few documents, those document types will appear in the **Recently used** folder, which allows you to easily create other new documents of those types.

For some document types, you may find a lot of different templates. For example, there are numerous templates for DocBook documents, and DITA topic types and maps. Choose the template that best meets your needs.

Writing Your First Document

Depending on the type of document you choose, the Oxygen XML Editor interface changes to support editing that document type. This may include new menus, toolbar buttons, and items in the contextual menus.

Also, depending on the type of document you choose, Oxygen XML Editor may open your document in **Text** *(on page 362)* or **Author** *(on page 363)* mode. **Text** mode shows the raw XML source file, while **Author** mode shows a graphical view of the document.

The availability of **Author** mode for your document type depends on the type you choose and if there is a CSS stylesheet available to create the **Author** mode. Oxygen XML Editor includes default **Author** mode views for most of the document types it supports. If your company has created its own document types, **Author** mode

stylesheets may have also been created for that type. However, if you create a plain XML file, or one based on a schema that is not included in the Oxygen XML Editor built-in support, you need to edit it in **Text** mode or create your own **Author** mode CSS *(on page 2424)* for it.

You can switch back and forth between **Author** mode and **Text** mode at any time by clicking the buttons at the bottom left of the editor window. You do not lose any formatting when switching from **Author** to **Text** mode. **Text** and **Author** modes are just different views for the same XML document.

There is also a **Grid** mode *(on page 363)* available that displays all content in an XML document as a structured grid of nested tables. This is useful for certain kinds of documents, particularly those that are structured like databases. You can also use it when you want to display XML content in a table-like manner (for example, if you need to extract XML content to a spreadsheet *(on page 597)*).

If you use **Author** mode, you might find that it is similar to word processors that you are used to. Likewise, the **Text** mode is similar to many other typical text editors. If you are new to XML, the biggest difference is that XML documents have a particular structure that you have to follow. Oxygen XML Editor assists you with a continuous validation of the XML markup.

Structuring Your First Document

Each XML document type has a particular structure that you have to follow as you write and edit the document. Some document types give you a lot of choices, while others give you very few. In either case, you need to make sure that your document follows the particular structure for the document type you are creating. This means:

- At any given location in the document, there are only certain XML elements allowed. Oxygen XML Editor helps you determine which elements are allowed. In **Author** mode, when you press **Enter**, Oxygen XML Editor assumes that you want to enter a new element and shows you a list of elements that can be created in this location. Keep typing until the element you want is highlighted and press **Enter** to insert the element. If you want to view the overall structure of a document and see what is allowed (and where), you can use the **Model** view *(on page 555)* (**Window > Show View > Model**).
- When you create certain elements, you may find that your text gets a jagged red underline and you get a warning that your content is invalid. This is usually because the element you have just created requires certain other elements inside of it. Your document will be invalid until you create those elements. Oxygen XML Editor helps you with this. If there is only one possible element that can go inside the element you just created, Oxygen XML Editor creates it for you. However, if there is more than one possibility, you have to create the appropriate elements yourself. In many cases, Oxygen XML Editor presents XML *Quick Fixes (on page 824)* that help you resolve errors by offering proposals to quickly fix problems such as missing required attributes or invalid elements.

Editing Your First Document

Once you have completed the first draft of your document, you may need to edit it. As with any editor, Oxygen XML Editor provides the normal cut, copy, and paste options as well as drag and drop editing. However, when

you are editing an XML document, you have to make sure that your edits respect the structure of the XML document type. In fact, you are often editing the structure as well as the content of your document.

Oxygen XML Editor provides many tools to help you edit your structure and to keep your structure valid while editing text.

The Document Breadcrumbs

Across the top of the editor window, there is a set of breadcrumbs that shows you exactly where the insertion point is in the structure of the document. You can click any element in the breadcrumbs to select that entire element in the document.

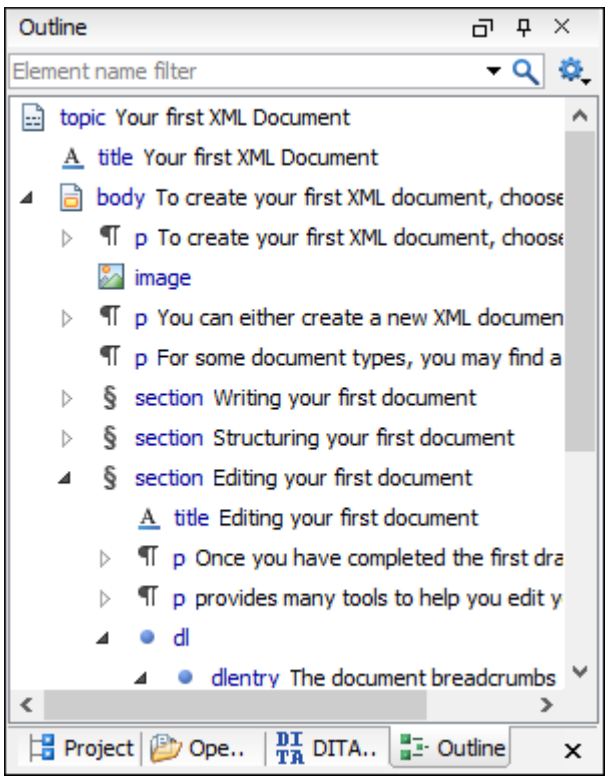
Showing Tags

To see exactly where you are in the structure of the document, you can show the tags graphically in the **Author** view. There are several levels of tag visibility that you can choose using the **Tags Display Mode** drop-down menu *(on page 604)* on the toolbar (the button may look a little different than this, as it changes to reflect the level of tags currently displayed).

Outline View

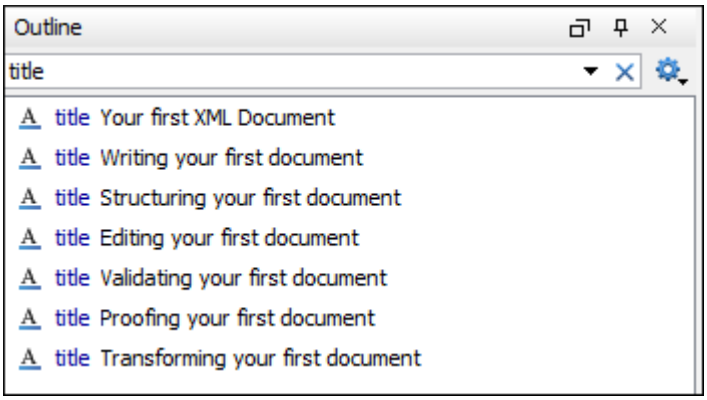
The **Outline** view *(on page 549)* shows you the structure of your document in outline format. You can use it to select elements, or to move elements around in the document.

Figure 3. Outline View



You can configure the **Outline** view to determine what is shown, such as element names, attributes, and comments. Certain choices may work better for particular document types. You can also filter the **Outline** view to show only elements with a certain name.

Figure 4. Outline View Filtered to only Show Element Names



Cut and Paste, Drag and Drop

You can cut and paste or drag and drop text, just as you would in any other editor. However, when you do this in **Author** view, it is important to remember that you are actually moving blocks of XML. When you cut and paste or drag and drop a block of XML, the result has to be valid both where the content is inserted, and where it is removed from.

A big part of doing this correctly is to make sure that you pick up the right block of text in the first place. Using the breadcrumbs or **Outline** view, or showing tags and using them to select content, can help ensure that you are selecting the right chunk of XML.

If you do try to paste or drop a chunk of XML somewhere that is not valid, Oxygen XML Editor warns you and tries to suggest actions that make it valid (such as by removing surrounding elements from the chunk you are moving, by creating a new element at the destination, or by inserting it in a nearby location).

If you are using **Author** mode, you can also switch to **Text** mode to see exactly which bits of XML you are selecting and moving.

Refactoring actions

You can perform many common structure edits, such as renaming an element or wrapping text in an element, using the actions in the **Refactoring** menu of the contextual menu (or the **Document > Markup** menu). More advanced refactoring operations are also available using the **XML Refactoring** tool *(on page 852)* that is available in the **Tools** menu.

Validating Your First Document

Validation is the process of making sure that an XML document abides by the rules of its schema. If Oxygen XML Editor knows how to find the schema, it validates the document for you as you type. Oxygen XML Editor finds the schema automatically for most of the document types created from templates. However, in some cases, you may have to tell it how to find the schema *(on page 786)*.

When Oxygen XML Editor validates as you type, there is a small bar at the right edge of the editor that shows you if the document is invalid and where errors are found. If the indicator at the top of that bar is green, your document is valid. If the document is invalid, the indicator turns red and a red flag shows you where the errors are found. Click that flag to jump to the error. Remember that sometimes your document is invalid simply because the structure you are creating is not yet complete.

In addition to problems with the validity of the XML document itself, Oxygen XML Editor also reports warnings for a number of conditions, such as if your document contains a cross reference that cannot be resolved, or if Oxygen XML Editor cannot find the schema specified by the document. The location of these warnings is marked in yellow on the validation bar. If the document contains warnings, but no errors, the validity indicator turns yellow.

You can also validate your document at any time by selecting the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu. When you validate in this manner, if errors are found, the validation result opens in a new pane at the bottom of the editor that shows each validation error on a separate line. Clicking the error takes you to the location in your document where the error was detected.

Note:
Be aware that the problem is sometimes in a different location from where the validator detects the error. To get more information about a validation error, right-click a validation error message, and select **Show Message**.

Proofing Your First Document

Oxygen XML Editor includes an automatic (as-you-type) spell checking feature *(on page 466)*, as well as a manual spell checking action. To check the spelling of your document manually, use the **Check Spelling** action on the toolbar or from the **Edit** menu.

Transforming Your First Document

An XML document must be transformed to be published. Transformations are specific to the particular type of document you have created. For example, a DITA transformation cannot be used on a DocBook file, or vice versa. A single document type may have many multiple transformations that produce different kinds of outputs. For some document types, such a DITA, many different content files may be combined together by a transformation. You need to locate and launch a transformation that is appropriate for your document type and the kind of output you want to generate.

Oxygen XML Editor uses transformation scenarios *(on page 1470)* to control the transformation process. Depending on the document type you have created, there may be several transformation scenarios already configured for your use. This may include the default transformation scenarios supplied by Oxygen XML Editor or ones created by your organization.

To see the list of transformations available for your document, select the **Apply Transformation Scenario(s)** action from the toolbar or the **Document > Transformation** menu. A list of available

transformation scenarios is displayed. Choose one or more scenarios to apply, and click **Apply associated**. Exactly how your transformed content appears depends on how the transformation scenario is configured.

Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Editor. Oxygen XML Editor makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Editor and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Editor works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Editor helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Editor, along with the features of DITA, in a variety of ways.

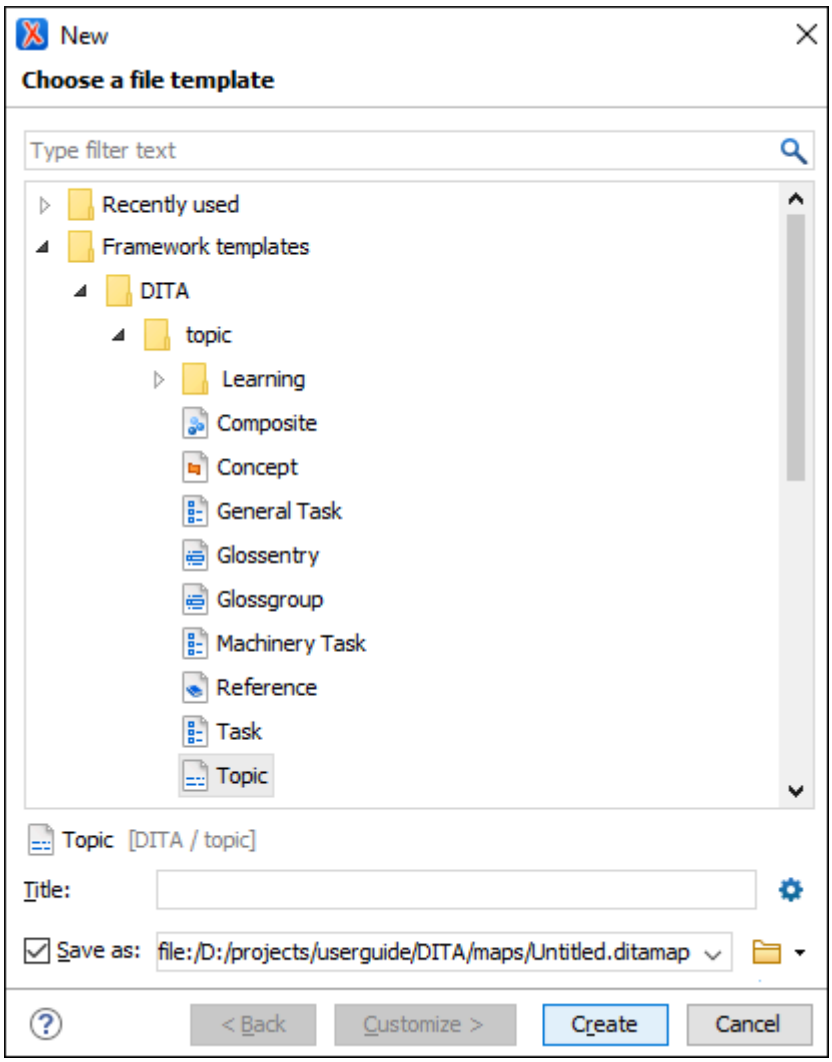
Creating a DITA Topic in Oxygen XML Editor

To create a DITA topic *(on page 3138)*:

1. Select **File >** **New** or click the **New** button on the toolbar.

   Step Result: The **New Document Wizard** *(on page 377)* is displayed:

Figure 5. New DITA Document Wizard



2. Go to **Framework templates > DITA > topic** and select the type of topic that you want to create.

> **Note:**
> If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

3. Select a file path where it will be saved. You can also optionally specify a title.
4. Click **Create**.

Result: Your document is opened in the editor. Eventually, you will need to add a reference to it in your DITA map *(on page 43)*.

Your DITA topic is an XML document, thus all the editing features that Oxygen XML Editor provides for editing XML documents *(on page 34)* also apply to DITA topics. Oxygen XML Editor also provides additional

specific DITA-related support for working with DITA topics *(on page 3136)*, their associated *DITA maps (on page 3071)*, and for creating DITA output *(on page 3263)*.

Role of Maps

The basic method that DITA uses to express the relationship between topics is through a *DITA map (on page 3419)*. Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

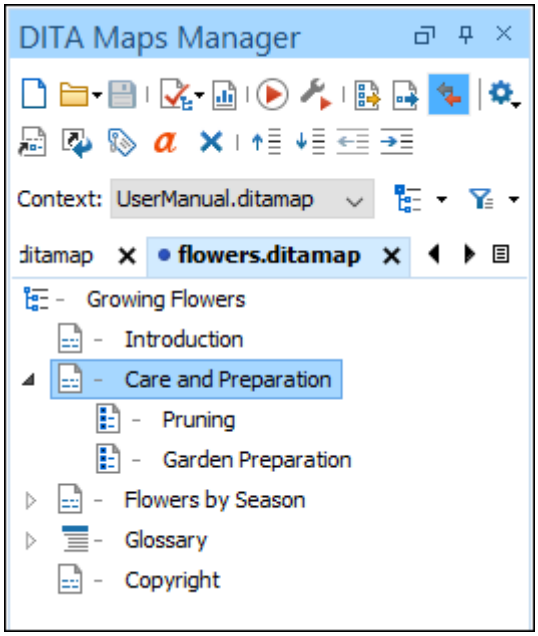
A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

Creating a Map in Oxygen XML Editor

To create a map *(on page 3090)*:

1. Select **File >** **New** or click the **New** button on the toolbar.
2. Go to **Framework templates > DITA Map > map** and select the type of map you want to create.
3. Choose whether you want to open the map in the **Editor** or in the **DITA Maps Manager** *(on page 3073)*. Usually, opening it in the **DITA Maps Manager** is the best choice. The **DITA Maps Manager** presents a view of the *DITA map* that is similar to a table of contents.

Figure 6. DITA Maps Manager View



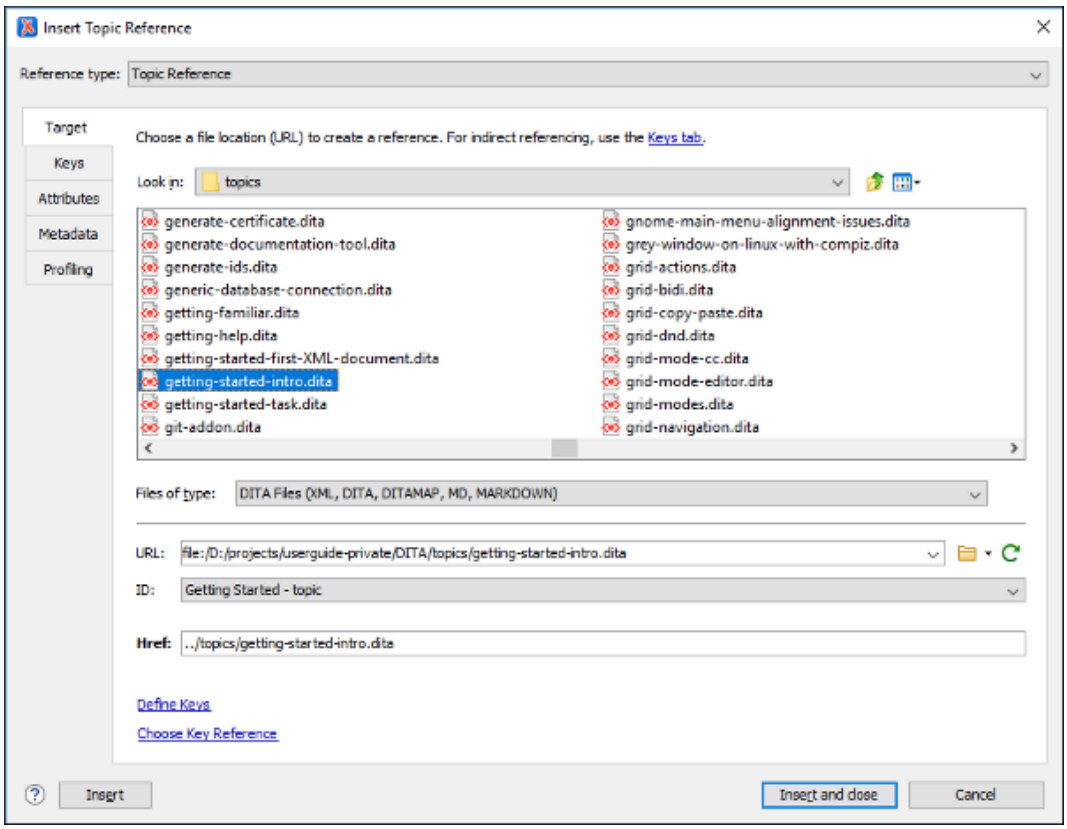
Adding Existing Topics to a Map in Oxygen XML Editor

There are several ways to add a topic reference to a map *(on page 3094)*. Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.
2. Right-click the *DITA map* in the **DITA Maps Manager** view *(on page 3073)* and choose **Reference to the currently edited file** from the **Append Child**, **Insert Before**, or **Insert After** submenu.

   Step Result: This opens the **Insert Reference** dialog box *(on page 3099)* with all of the required fields already filled in for you.

Figure 7. Insert Reference Dialog Box



3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
4. Select **Insert and close** to add a reference to your topic in the map.
5. Save the *DITA map*.

Adding New Topics to a Map in Oxygen XML Editor

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To add a new topic to a map *(on page 3094)*, follow these steps:

1. In the **DITA Maps Manager** *(on page 3073)*, right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New** file dialog box *(on page 3139)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New** file dialog box *(on page 3139)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New** file dialog box *(on page 3139)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

   Note:
   The value of the root ID is generated taking the *Use the file name as the value of the root ID attribute* option from the **DITA > Topics** preferences page *(on page 282)* into account. When the option is deselected, a unique ID is generated.

   Step Result: The new topic is now referenced (as a `<topicref>`) in the *DITA map* at the location where you inserted it and the new topic is opened in the editor.

3. Save the *DITA map*.

You can also change the order and nesting of topics in the **DITA Maps Manager** view by doing either of the following:

- Select the topic to move while holding down the **Alt** key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

Adding Submaps in Oxygen XML Editor

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can break up the content into smaller submaps *(on page 3091)*. A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To add a child map to the current map *(on page 3091)*:

1. Right-click the parent *DITA map* in the **DITA Maps Manager** view *(on page 3073)* and choose **Append child > Map reference**.

   Step Result: This opens the **Insert Reference** dialog box *(on page 3099)* with all of the required fields already filled in for you.
2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
3. Select **Insert and close** to add a reference to your submap in the main map.
4. Save the main *DITA map*.

Validating a Map in Oxygen XML Editor

Just as it is with your individual topics, it is important to validate your maps *(on page 3118)*. Oxygen XML Editor provides a validation function for *DITA maps* that does more than simply validating that the XML is well-formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the  **Validate and Check for Completeness** button in the **DITA Maps Manager** view *(on page 3073)*.

   Step Result: This opens the **DITA Map Completeness Check** dialog box *(on page 3119)*.
2. Select any of the various options you want to check.
3. Click **Check** to run the validation process.

Publishing Your Topics in Oxygen XML Editor

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you create published output *(on page 3263)* by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By

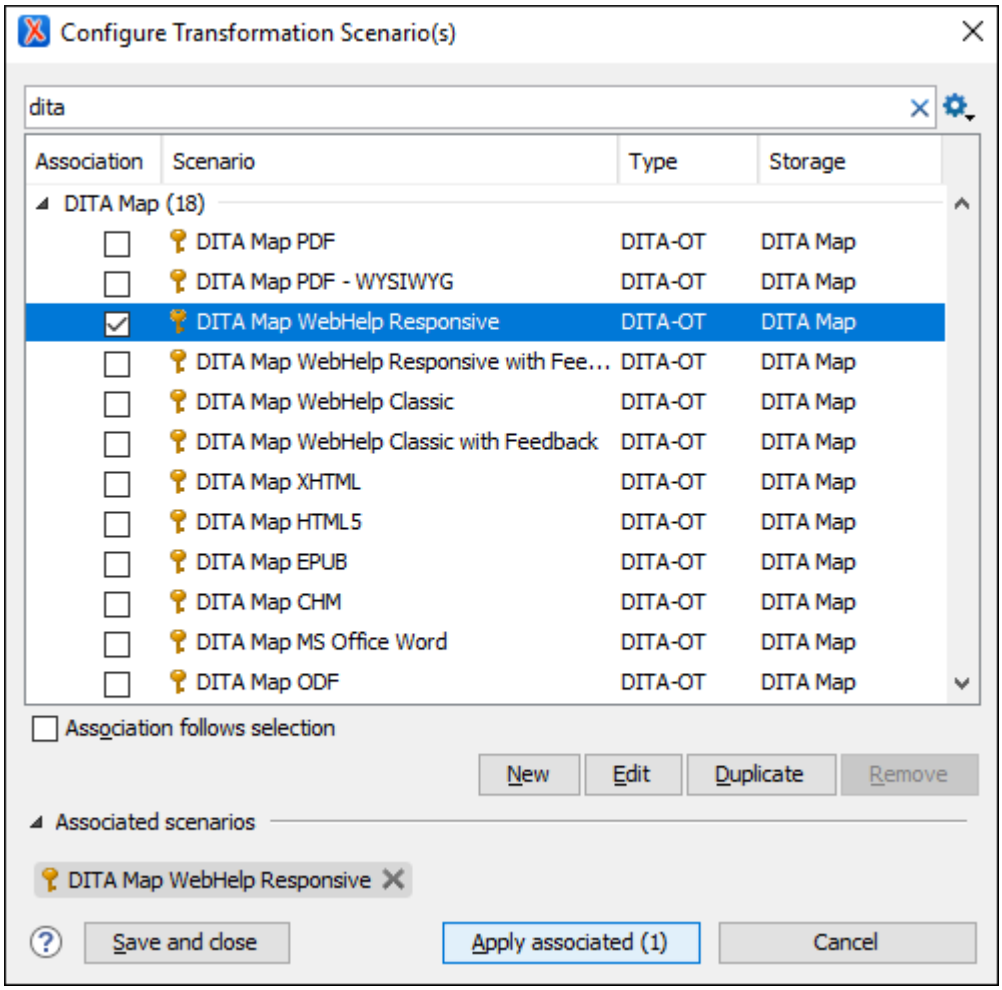
default, Oxygen XML Editor uses the transformations provided by the **DITA Open Toolkit** for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in **DITA Open Toolkit** transformations. In either case, Oxygen XML Editor manages them by using transformation scenarios.

To publish output for a map:

1. Click the **Configure Transformation Scenario(s)** button in the **DITA Maps Manager** view *(on page 3073)*.

   Step Result: This opens the **Configure Transformation Scenario(s)** dialog box *(on page 1600)*.

   Figure 8. Configure Transformation Scenarios Dialog Box



2. Select the appropriate transformation depending on the type of output you desire.
3. To change or view the configuration or storage options for a transformation scenario, select the transformation and click **Edit**.
4. Click **Apply associated**.

Result: Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application.

DITA Projects

Once you have a basic understanding of DITA and how to work with DITA topics and maps, you probably want to create a DITA project to organize and manage your planned content/resources *(on page 409)*. Oxygen XML Editor includes a **Project** view *(on page 413)* that helps you organize your projects and offers a variety of helpful project-related features and makes it easy to share your projects with other members of your team.

Tip:
There are several sample project templates available for DITA users that can be used as a starting point or for inspiration. These sample project templates are found in the **Framework templates > DITA** folder in the **New Project** wizard: *(on page 410)*

- **Sample DITA Project** - This is a basic DITA project meant to help new users see how a DITA project is structured.
- **Startup DITA Project** - This is a startup DITA project that imposes a custom set of options (e.g. spell check settings and custom dictionaries), a custom DITA framework extension (e.g. custom new file templates. custom actions, custom CSS used for visual editing) and a folder structure for a DITA project according to best practices. Once created, the project contains a `Readme.html` file that explains all customizations and their benefits. If you plan to start your own DITA project using a version control system (such as Git), you can use this startup DITA project template to customize various aspects of DITA editing and share them with your team.

Resources

For more information about getting started with DITA and how to work with DITA in Oxygen XML Editor, see our compiled collection of DITA-related webinars that are meant to help you with your journey into working with DITA: Webinars: Working with DITA in Oxygen.

Doctales - DITA Introduction

Creating a New Project

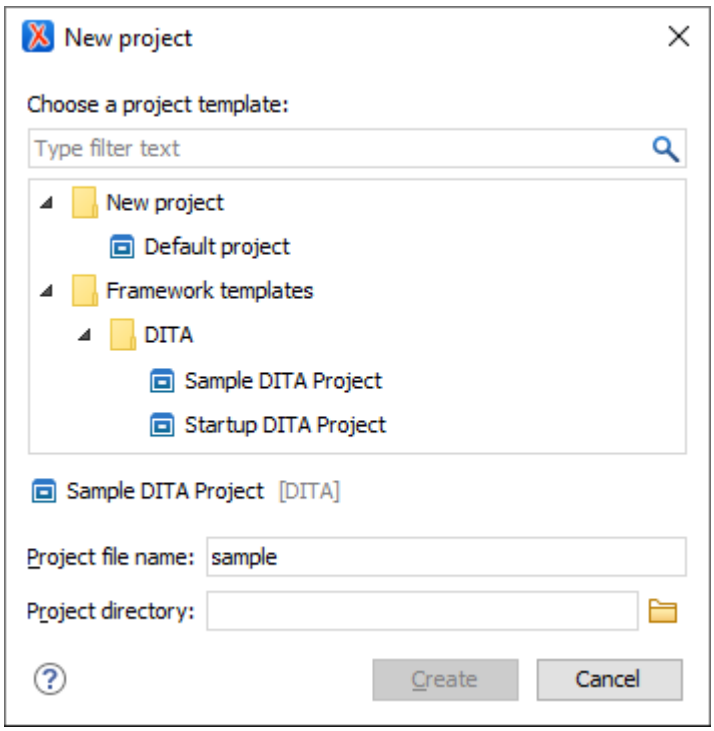
Oxygen XML Editor allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. You can also share your project settings and transformation/validation scenarios *(on page 425)* with other users. Use the **Project** view *(on page 413)* to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select **New Project** from the **Project** menu, the **New** menu in the contextual menu, or the drop-down menu at the top-left of the **Project** view.

This opens a new project wizard:

Figure 9. New Project Wizard



Tip:
There are several sample project templates available for DITA users that can be used as a starting point or for inspiration. These sample project templates are found in the **Framework templates > DITA** folder in the **New Project** wizard: *(on page 410)*

- **Sample DITA Project** - This is a basic DITA project meant to help new users see how a DITA project is structured.
- **Startup DITA Project** - This is a startup DITA project that imposes a custom set of options (e.g. spell check settings and custom dictionaries), a custom DITA framework extension (e.g. custom new file templates. custom actions, custom CSS used for visual editing) and a folder structure for a DITA project according to best practices. Once created, the project contains a `Readme.html` file that explains all customizations and their benefits. If you plan to start your own DITA project using a version control system (such as Git), you can use this startup DITA project template to customize various aspects of DITA editing and share them with your team.

With the exception of the *Default project* template, which is a pseudo-template and does not exist on the local disk (it is used only to create a new `.xpr` file), project templates are actually ZIP archives (with a `.zxpr`

extension) and are stored within the file template directory structure (for example, `frameworks\dita\templates\sample-project\Sample DITA Project.zxpr`).

Tip:
Archives with a `.zxpr` extension can be edited in the **Archive Browser** view *(on page 2126)*.

After selecting a project template, you can specify the following:

Project file name

Specifies the name of the new project file. Oxygen XML Editor provides a default proposal for the file name based on the following rules:

- If there is an `.xpr` file inside the archive, its name is used.
- Otherwise, the name of the template is used.

Project directory

Specifies the directory where the archive content will be extracted.

Note:
The archive should not contain an extra single folder as the root. For the **Project directory** path to work properly, the archive must have the `.xpr` file on the first level, along with the other resources (files and folders).

Once you are done, click the **Create** button to begin the creation process. Oxygen XML Editor extracts the content from the archive inside the path specified in the **Project directory** field.

Editor Variables in Project Templates

By default, the editor variables inside project resources created from a project template are not resolved. To start having them resolved, the project template must be customized *(on page 387)* by using the `expandEditorVariablesIncludeFilter` property. This filter determines the resources where the editor variables will be resolved. If you need to exclude a subset of resources from the set specified by the `expandEditorVariablesIncludeFilter` property, the `expandEditorVariablesExcludeFilter` property can be used.

Note:
Usually, project files (`*.xpr`), framework files (`*.framework`), and framework extension scripts (`*.exf`) should be excluded from the editor variable resolving process.

The values of the inclusion and exclusion filters can be file paths relative to the project directory that can use wildcards or simply wildcards. Each filter can have multiple values, separated by spaces.

Possible filter values:

- `./*` - Matches all resources from the first level in the project directory.
- `*` or `./**` - Matches all resources on all levels inside the project directory.
- `dir1/dir2/*.dita` - Matches all `.dita` files from `[PROJECT_DIR]/dir1/dir2`, but not from subdirectories of `dir2`.
- `dir1/dir2/**/*.dita` - Matches all `.dita` files from `[PROJECT_DIR]/dir1/dir2`, including those from subdirectories of `dir2`.
- `dir1/**/*` - Matches all resources on all levels inside `[PROJECT_DIR]/dir1`.
- `dir1/article1.xml, dir2/article2.xml` - Matches only the two `.xml` files.
- `./**/*_suffix.md, ./**/prefix_*.html` - Matches all `.md` files with names that end with `_suffix` and all `.html` files with names that start with `prefix_`.

Adding Items to the Project

To add items to the project, select any of the following actions that are available when invoking the contextual menu in the **Project** view:

New > **File**

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

New > **Folder**

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

The project itself is considered a logical folder. You can add a logical folder, or content to a logical folder, by using one of the following actions that are available in the contextual menu, when invoked from the *project root*:

New > **Logical Folder**

Creates a logical folder in the tree structure (the icon is a magenta folder on macOS -).

New > Logical Folders from Web

Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on macOS -).

Add Files

Adds links to files on the local file system.

Add Edited File

Adds a link to the currently edited file in the project.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the **Refresh (F5)** action from the project contextual menu and the **Project** view *(on page 413)* will display the existing files and subdirectories. If your files are scattered among several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (macOS Finder) to the project tree, or by selecting **Add Folder** in the contextual menu from the *project root*. Linked folders are displayed in the **Project** view *(on page 413)* with bold text. To create a file inside a linked folder, select the **New >** **File** action from the contextual menu. The linked files presented in the **Project** view *(on page 413)* are marked with a special icon.

Note:
Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see Project View *(on page 413)*.

For more details about how you can share projects with other users, see Sharing a Project - Team Collaboration *(on page 425)*.

Getting Help

If you run into specific problems while using Oxygen XML Editor you can take advantage of a variety of support related resources. Those resources include the following:

- The Oxygen XML Editor Support Section of the Website
- The Oxygen XML Editor Forum
- The Oxygen XML Editor Video Tutorials
- The Common Problems and Solutions Section of the User Manual *(on page 3032)*
- The Online Technical Support Form

The application also includes various specific help-related resources in the **Help** menu.

Help Menu

The Oxygen XML Editor **Help** menu provides various resources to assist you with your tasks.

This menu includes the following actions or options:

Welcome

This option opens the **Welcome** screen that includes some resources to assist you with using Oxygen XML Editor.

Help (F1)

Use this action (or the **F1** key) to open a dialog box that presents a section in the User Manual that is appropriate for the context of the current cursor position. If the **Use online help** option is selected, this action will open the User Manual in an online mode.

Show Dynamic Help view

Use this action to open a view that loads the latest online WebHelp version of the Oxygen XML Editor User Manual, and dynamically opens a topic that is relevant to the focused editor, view, or dialog box.

You can also open the **Dynamic Help** view by selecting it from the **Window > Show View** menu.

Download User Manual

Opens the appropriate HTML page for downloading the Oxygen XML Editor User Manual. This action is helpful if your internet access is restricted and you need to access the user guide.

Install new add-ons

Opens a dialog box that allows you to install new *add-ons (on page 3422)* to extend the functionality of Oxygen XML Editor.

Check for add-ons updates

Opens a dialog box that allows you to check for updates on installed *add-ons (on page 3422)*.

Manage add-ons

Opens a dialog box that allows you to manage installed *add-ons (on page 3422)*.

Check for a New Version

Use this action to view information about the latest version of Oxygen XML Editor.

Check for notifications

Use this action to have the application check **Oxygen's** website for news and events that will be displayed in a dialog box.

Browse Oxygen Website

Opens the Oxygen XML Editor website in your default internet browser.

Register

If you encounter problems with your Oxygen XML Editor license, you can use this option to open a dialog box that provides options for obtaining or using a license key.

Lock/Unlock floating license

If you are using a *Floating License*, you can lock it so that it does not get released to the pool *(on page 110)* unless you or the system administrator unlocks it.

Report problem

You can use this option to open a dialog box that allows you to write the description of a problem that was encountered while using the application. You can also select additional information to be sent to the technical support team in the five tabs:

- **General info** - You can edit your contact details in case you want to be contacted for further details or to be notified of a resolution.
- **Class Loader URLs** - You can choose whether or not to include the listed *Class Loader URLs* with your report.
- **System properties** - You can choose whether or not to include the listed system property details with your report.

> **Tip:**
> You are able to change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

- **Plugins** - You can choose whether or not to include details about your installed *plugins (on page 3422)* with your report.
- **Frameworks** - You can choose whether or not to include details about your installed *frameworks (on page 3420)* with your report.

Support Center

Use this option to open the Oxygen XML Editor Support Section of the Website.

Support Tools > Clipboard Inspector

Opens a dialog box that displays extensive details of all the transferable objects from the clipboard. This is helpful if you experience problems while copying content from other applications and pasting it into Oxygen XML Editor. You can use the **Copy** button to copy all of this data and then paste it into an email to be sent to the *Oxygen* support team.

Support Tools > Randomize XML text content

Use this action when you need to send samples to the *Oxygen* support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources that will have the text content randomized. You can then save the resources and send them to the *Oxygen* support team without fear of compromising sensitive or private data. For more information, see Randomize XML Text Content *(on page 54)*.

> **Warning:**
> Before using this action, it is highly recommended that you copy the XML resources to be processed, save them in a separate folder, and then process this operation on the copies instead of the original files. Otherwise, you may lose your original content.

Tip of the Day

Opens a dialog box that offers tips for using Oxygen XML Editor.

About

Use this option to open a dialog box that contains information about Oxygen XML Editor and the installed version. This dialog box includes the following tabs:

- **Copyright** - This tab contains general information about the product and the version of the product you are using, along with contact details and the *SGN* number. Details regarding the memory usage are also presented at the bottom of the dialog box.
- **Libraries** - This tab presents the list of third-party libraries that Oxygen XML Editor uses. To view the End-User Licence Agreement of each library, double-click it.
- **Frameworks** - This tab contains a list with the *frameworks (on page 3420)* that are bundled with Oxygen XML Editor.
- **System Properties** - This tab contains a list with system properties and their values. The contextual menu allows you to select and copy the properties.

Related information

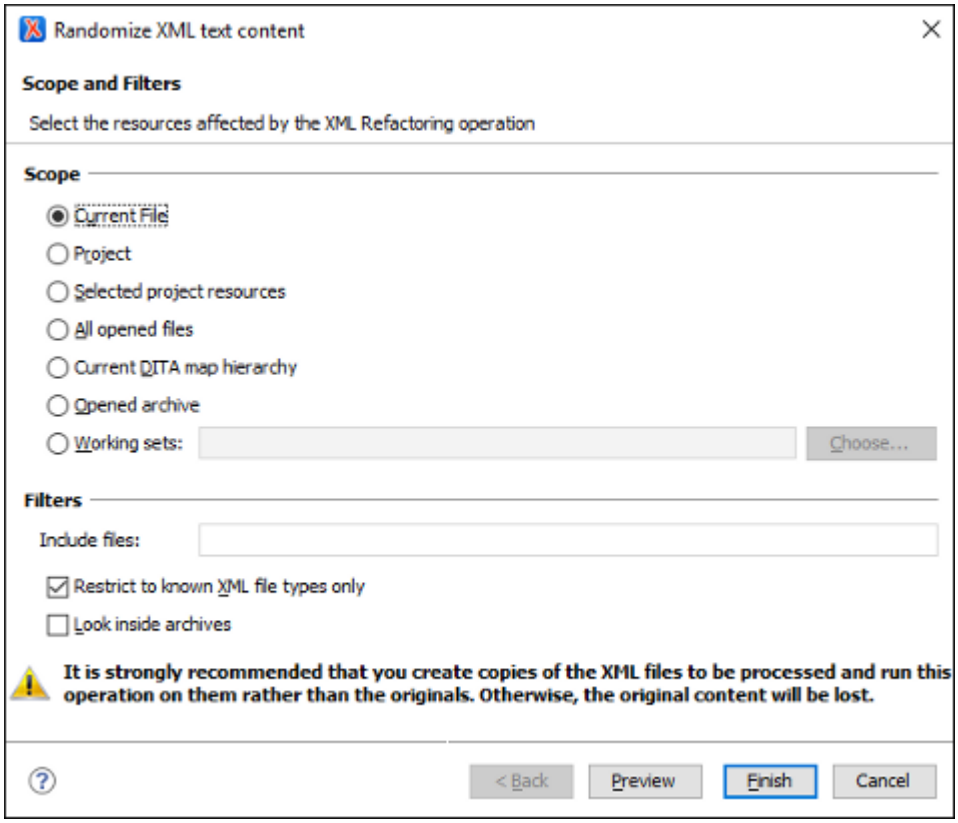
Details to Submit in a Request for Technical Support Using the Online Form *(on page 3041)*

Randomize XML Text Content

Oxygen XML Editor includes an action that randomizes the text content of an XML document. This action is available in the **Help > Support Tools** menu. It is helpful if you need to send XML samples to the *Oxygen* support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources that will have the text content randomized. You can then save the resources and send them to the *Oxygen* support team without fear of compromising sensitive or private data.

Warning:
Before using this action, it is highly recommended that you copy the XML resources to be processed, save them in a separate folder, and then perform this operation on the copies instead of the original files. Otherwise, you may lose your original content.

Figure 10. Randomize XML Text Content Dialog Box



The **Randomize XML Text Content** dialog box includes the following options:

Scope

Allows you to select the set of files whose text content will be randomized by the operation. You can select from predefined resource sets (such as the current file, your whole project, the current *DITA map (on page 3419)* hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a *working set (on page 3425)*.

Filters

This section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When selected, the resources inside archives will also be affected.

Frequently Used Shortcut Keys

Oxygen XML Editor includes numerous shortcut keys that are assigned to actions to help you edit content. All the shortcuts that are assigned to actions are displayed in the table in the **Menu Shortcut Keys** preference page *(on page 303)*.

For information about how to assign or configure shortcut keys, see How to Assign a Shortcut Key or Edit an Existing Shortcut *(on page 305)*.

Table 1. Frequently Used Shortcut Keys in Oxygen XML Editor

Action	Windows/Linux Shortcut Keys	macOS Shortcut Keys	Description of Default Assigned Action
Attribute Editor	**Alt + Enter**	**Option + Enter**	Opens the in-place attribute editor
Beginning	**Ctrl + Home**	**Command + Home**	Navigates to the beginning of the document
Check Spelling	**F7**	**F7**	Opens the spell checking dialog box
Check Well-Formedness	**Ctrl + Shift + W**	**Command + Shift + W**	Check well-formedness of current document
Configure Transformation	**Ctrl + Shift + C**	**Command + Shift + C**	Opens the Configure Transformation Scenario dialog box
Content Completion / New Line	**Enter**	**Enter**	• **Author** mode - Opens the content completion window • **Text** mode - Moves cursor to the next line
Content Completion (**Text** Mode)	**Ctrl + Space**	**Command + Space**	Opens the content completion window in **Text** mode
Create Bookmark #	**Ctrl + Shift + 1-9**	**Command + Shift + 1-9**	Create bookmarks numbered 1 through 9
Create Next Bookmark	**F9**	**F9**	Create bookmark numbered whatever is next in sequence
Delete Next Word	**Ctrl + Delete**	**Command + Delete**	Deletes the next word or whitespace

Table 1. Frequently Used Shortcut Keys in Oxygen XML Editor (continued)

Action	Windows/Linux Shortcut Keys	macOS Shortcut Keys	Description of Default Assigned Action
Delete Previous Word	**Ctrl + Backspace**	**Command + Backspace**	Deletes the previous word or whitespace
Delete Tags	**Alt + Shift + X**	**Command + Option + X**	Deletes the start and end tag of the current element
Duplicate Lines Up (**Text** Mode)	**Ctrl + Shift + UpArrow**	**Option + Shift + UpArrow**	Duplicates the selected lines (or current line) and inserts it above the current selection/line
Duplicate Lines Down (**Text** Mode)	**Ctrl + Shift + DownArrow**	**Option + Shift + DownArrow**	Duplicates the selected lines (or current line) and inserts it below the current selection or line
End	**Ctrl + End**	**Command + End**	Navigates to the end of the document
Exit	**Ctrl + Q**	**Command + Q**	Exit the application
Find	**Ctrl + F**	**Command + F**	Opens Find/Replace dialog box
Find Next	**F3**	**Command + G**	Finds next occurrence of the last searched term
Find Previous	**Shift + F3**	**Command + Shift + G**	Finds previous occurrence of the last searched term
Go To Bookmark	**Ctrl + 1-9**	**Command + 1-9**	Go to specific bookmark
Go To Definition	**Shift + Ctrl + Enter**	**Shift + Command + Enter**	Go to the definition of the selected item in the associated schema.
Help	**F1**	**F1**	Opens help documentation
Insert Para / Format Indent	**Ctrl + Shift + P**	**Command + Shift + P**	• **Author** mode - Inserts a paragraph at the cursor position • **Text** mode - Formats and indents current document

Table 1. Frequently Used Shortcut Keys in Oxygen XML Editor (continued)

Action	Windows/Linux Shortcut Keys	macOS Shortcut Keys	Description of Default Assigned Action
Move Tab Left	**Ctrl + Alt + Comma**	**Ctrl + Option + Comma**	Moves the current file tab one position to the left
Move Tab Right	**Ctrl + Alt + Period**	**Ctrl + Option + Period**	Moves the current file tab one position to the right
Move Node Down (**Author**)	**Alt + DownArrow**	**Option + DownArrow**	Moves the selected XML node down in **Author** mode
Move Node Down (**Text**)	**Ctrl + Alt + DownArrow**	**Command + Option + DownArrow**	Moves the selected XML node down in **Text** mode
Move Node Up (**Author**)	**Alt + UpArrow**	**Option + UpArrow**	Moves the selected XML node up in **Author** mode
Move Node Up (**Text**)	**Ctrl + Alt + UpArrow**	**Command + Option + UpArrow**	Moves the selected XML node up in **Text** mode
New File	**Ctrl + N**	**Command + N**	Opens wizard for creating new documents
Next Word	**Ctrl + RightArrow**	**Command + RightArrow**	Navigates to next word
Open/Find Resource	**Ctrl + Shift + R**	**Command + Shift + R**	Opens the Open/Find Resource dialog box
Previous Word	**Ctrl + LeftArrow**	**Command + LeftArrow**	Navigates to previous word
Print Preview	**Ctrl + P**	**Command + P**	Opens the print preview (page setup) dialog box
Quick Assist	**Alt + 1**	**Command + Option + 1**	Opens Quick Assist menu if actions are available in the current context (usually indicated with a bulb 💡 icon in the left stripe)
Quick Find	**Alt + Shift + F**	**Option + Shift + F**	Opens the Quick Find mechanism at the bottom of the editor
Redo	**Ctrl + Y** (Windows) - **Ctrl + Shift + Z** (Linux)	**Command + Shift + Z**	Redo last editing action

Table 1. Frequently Used Shortcut Keys in Oxygen XML Editor (continued)

Action	Windows/Linux Shortcut Keys	macOS Shortcut Keys	Description of Default Assigned Action
Refresh	**F5**	**F5**	Refresh
Remove Bookmarks	**Ctrl + F7**	**Command + F7**	Removes all bookmarks
Reopen Last Closed Editor	**Ctrl + Alt + T**	**Command + Option + T**	Reopens the editor tab that was closed most recently
Reset Zoom	**Ctrl + NumPad0**	**Command + NumPad0**	Resets zoom (default font size)
Save	**Ctrl + S**	**Command + S**	Saves current document
Save All	**Ctrl + Shift + S**	**Command + Shift + S**	Saves all open files
Scroll Down	**Ctrl + DownArrow**	**Command + DownArrow**	Scrolls the editor down
Scroll Up	**Ctrl + UpArrow**	**Command + Up Arrow**	Scrolls the editor up
Select Content of Element	**Alt + [Mouse Triple Click]**	**Option + [Mouse Triple Click]**	Selects the content of an element in **Author** mode.
Shift Left	**Shift + Tab**	**Shift + Tab**	• **Author** mode - Moves the cursor to the previous XML node • **Text** mode - Shifts content to the left
Shift Right	**Tab**	**Tab**	• **Author** mode - Moves cursor to the next XML node • **Text** mode - Shifts content to the right
Split Element	**Alt + Shift + D**	**Ctrl + Option + D**	Splits the element the cursor position
Surround With	**Ctrl + E**	**Command + E**	Surrounds selected content with specified tag

Table 1. Frequently Used Shortcut Keys in Oxygen XML Editor (continued)

Action	Windows/Linux Shortcut Keys	macOS Shortcut Keys	Description of Default Assigned Action
Switch Tabs	**Ctrl + Tab** / **Ctrl + Shift + Tab**	**Command + Tab** / **Command + Shift + Tab**	Switches between open tabs
Transform	**Ctrl + Shift + T**	**Command + Shift + T**	Opens a dialog box for selecting a transformation scenario
Underline / Open URL	**Ctrl + U**	**Command + U**	• Underlines selected content (in the main editor) • Opens the URL (when focus is outside the main editor)
Undo	**Ctrl + Z**	**Command + Z**	Undo last editing action
Zoom In	**Ctrl + NumPad+**	**Command + NumPad+**	Zooms in (increase font size)
Zoom Out	**Ctrl + NumPad-**	**Command + NumPad-**	Zooms out (decrease font size)

Troubleshooting:
If you encounter problems with keyboard shortcuts not working as expected, see Keyboard Shortcuts Result in Unexpected Behavior *(on page 3054)* or Keyboard Shortcuts Do Not Work At All *(on page 3053)*.

Accessibility Support in Oxygen

The **Oxygen** team is dedicated to developing software products that are usable for everyone, including those with physical challenges and disabilities. Oxygen XML Editor is designed to adhere to the U.S. Government Section 508 accessibility standards: https://www.oxygenxml.com/xml_editor/section508.html.

Adjusting Fonts and Colors

If you have low vision, go to **Options > Preferences > Appearance > Fonts** where you can adjust the font styles and sizes used in the entire application, both for the editing areas and UI labels. If you have color blindness, you can also adjust most of the colors used in Oxygen XML Editor by going to **Options > Preferences > Appearance** and changing the current color theme. You can also search for other color-related settings in the **Preferences** dialog box.

Installing Oxygen XML Editor

Installation kits for Windows and Linux are made using the Install4j product. If you have problems navigating the Install4j installation wizard, you can run the installation from a command-prompt application using the **-c** flag *(on page 91)* like this:

```
C:\Users\your_user_name\Downloads\oxygenAuthor-64bit.exe -c
```

Screen Reader Software (Windows OS)

If you are using a text-to-speech narrator, Oxygen XML Editor supports this since it is a Java application and it is periodically tested on Windows using both the NVDA and JAWS screen readers on the Windows operating system.

Using the JAWS Screen Reader (Windows)

The JAWS (Job Access With Speech) screen reader can be downloaded from: http://www.freedomscientific.com/Products/Blindness/JAWS.

For JAWS to work, you need to enable the Java access bridge in Oxygen XML Editor: http://docs.oracle.com/javase/7/docs/technotes/guides/access/enable_and_test.html.

To enable the Java access bridge:

1. Since Oxygen XML Editor comes bundled with its own Java VM, you need to open a command-prompt application and use the **cd** command to go to the Oxygen XML Editor installation directory (for example, in Windows, it would be something like this:
   ```
   cd C:\Program Files\Oxygen XML Editor 21.1
   ```
2. Then run the following command:
   ```
   jre\bin\jabswitch -enable
   ```
3. Press **Enter** and you should receive a notification that the access bridge has been enabled.

Once the Java access bridge is enabled and as long as the JAWS narrator is active, when Oxygen XML Editor starts, the narrator will start reading content from Oxygen XML Editor and you can interact with the application and read menus, content from open XML documents, and UI components from dialog boxes and side views.

Using the NVDA Screen Reader (Windows)

The NVDA screen reader can be downloaded for free from: https://www.nvaccess.org/.

For NVDA to work, you need to enable the Java access bridge in Oxygen XML Editor: http://docs.oracle.com/javase/7/docs/technotes/guides/access/enable_and_test.html.

To enable the Java access bridge:

1. Since Oxygen XML Editor comes bundled with its own Java VM, you need to open a command-prompt application and use the **cd** command to go to the Oxygen XML Editor installation directory (for example, in Windows, it would be something like this:
   ```
   cd C:\Program Files\Oxygen XML Editor 21.1
   ```
2. Then run the following command:

```
jre\bin\jabswitch -enable
```

3. Press **Enter** and you should receive a notification that the access bridge has been enabled.

Once the Java access bridge is enabled and as long as the NVDA narrator is started, when Oxygen XML Editor starts, the narrator will start reading content from Oxygen XML Editor and you can interact with the application and read menus, content from open XML documents, and UI components from dialog boxes and side views.

Important:
If after these steps the narrator still does not read anything from a started Oxygen XML Editor application, please go to the folder `C:\Windows\SysWOW64\` and make sure the library `WindowsAccessBridge-32.dll` is present there. If it is not present, try to search online, download the library file and copy it to the folder. Then restart Oxygen XML Editor.

Besides the main editing area, Oxygen XML Editor also has side views (for example, the **Attributes**, **Outline**, **Elements** views) that help with editing the XML content. NVDA versions **2020.1** and older have a registered bug that makes the narrator read content from the side views when editing in the main editing area. Because of this problem, when using NVDA versions **2020.1** or older, the following workflow is suggested:

1. Start Oxygen XML Editor.
2. Go to the **Window** menu and select **Maximize Editing Area** (or **hold Alt, then W, then M**). This action will hide all side views and allow you to properly edit in the main editing area.
3. Whenever you want to open a side view, go to **Window > Show View** (or **hold Alt, then W, then S**) and choose the view you want to open. For example, to show the **Elements** view, you can **hold Alt, then W, then S, then E**.
4. When you are done using the side view, go to the **Window** menu and select **Hide current view** (or **hold Alt, then W, then H**) to hide the side view and return the focus to the main editing area.

Hints for the Visually Impaired

Here are a few hints for using Oxygen XML Editor if you are visually impaired:

- The top main menu contains actions to open, save, and close documents, switch between open documents, or switch between the various editing modes for XML documents that are already open. All actions in the main menu bar should have mnemonics making it possible to memorize various shortcuts. For example, using the **alt-w-s-e** shortcut should open the **Window** menu, open the **Show view** submenu from it and show the **Elements** view,
    - The **File** menu contains actions to open, save, or close the currently edited XML document.
    - The **Edit** menu contains actions to undo/redo or cut/copy/paste content. They also have the usual shortcuts that can be used instead of directly invoking the actions from the menu.
    - The **Find** menu contains an action to show the **Find/Replace** dialog box. Sometimes the **JAWS** narrator overloads the **CTRL+F** shortcut and presents its own find/replace window but the Oxygen XML Editor **Find/Replace** dialog box provides the ability to perform complex find/replace operations in the open file.

    - In the **Options** menu, you have access to the **Preferences** dialog box that contains global application settings and access to the **Menu Shortcut Keys** table where you can configure shortcuts for the most commonly used actions.
    - The **Window** menu includes actions to switch between open XML documents. Also, you can use the **Show view** submenu to open a particular side view and move the focus to that view.
- An open XML document can be edited with accessibility support either in the **Text** editing mode (where the XML tags are accessible in the edited content) or in the visual **Author** editing mode (where the XML tags are hidden and only the text content is shown). You can switch between these editing modes by using the **Document > Edit Mode** menu.

    - **Text** mode provides access to the entire source document with all of its **XML** content, just like you have in any text editing application.

      Pressing the **<** key will present a list of available XML elements *(on page 3418)*. If you do not want to choose from the list whenever you want to insert an XML element, you have two choices:
        - After the list of available XML elements is shown, you can press the **ESC** key to close it and continue to manually insert the XML tag.
        - You can disable the content completion list from the **Options > Preferences > Editor / Content Completion** page by deselecting **Enable Content Completion**. After the content completion is disabled, you can force it to be displayed by using the **Ctrl+Space** keyboard shortcut.

      In addition, using the **Window > Show view** submenu, you can change focus to the **Attributes**, **Elements**, or **Outline** view. The **Attributes** view presents the existing and possible attributes that can be inserted in an XML tag. The **Elements** view shows you the list of XML elements that can be inserted at the cursor position (also, pressing **F2** on a selected element presents its annotation). The **Outline** view shows the current path in the XML structure.

    - **Author** mode is useful for reviewing written XML content because it has support for change tracking and for adding comments. Editing in the **Author** visual editing mode, you have access to only the text content in the XML document.

      Pressing **Shift+F2** will read the current element context where the cursor is located. Pressing **Ctrl+Shift+F3** will read the current element context and the entire path in the XML structure where the cursor is located. You can also use the **Outline** view to better understand the XML structure.

      In the **Author** editing mode, you can also use the **Attributes** and **Elements** views similar to using them in the **Text** editing mode. Pressing **Enter** in the **Author** visual editing mode can also be used to present a list of allowed elements at the current position.

Screen Reader Software (macOS)

On **macOS**, the application can be used with **VoiceOver** but is not rigorously tested with it. Because of processing limitations of the **VoiceOver** application, various limitations may be encountered. To avoid

blocking the application, when tree-structure user interface controls are used (e.g. the **Project** or **Outline** view), if a node in the tree contains more than 500 child nodes, only the first 500 child nodes are accessible to the screen reader.

Oxygen XML Editor VPAT Accessibility Conformance Report

A Voluntary Product Accessibility Template (VPAT) is a document that explains how information and communication technology (ICT) products such as software, hardware, electronic content, and support documentation meet (conform to) the Revised 508 Standards for IT accessibility. VPAT documents help Federal agency contracting officials and government buyers to assess ICT for accessibility when doing market research and evaluating proposals.

This document provides information about how Oxygen XML Editor addresses the accessibility requirements defined in the international standards.

International Edition

VPAT® Version 2.3 – April 2019

Name of Product/Version

Oxygen XML Editor 26.1

Product Description

Oxygen XML Editor is a cross-platform application designed to accommodate all of your XML editing, authoring, developing, and publishing needs.

Date

March 2023

Contact Information

support@oxygenxml.com

Notes

Oxygen XML Editor has been designed and enhanced to adhere to the U.S. Government Section 508 accessibility standards and the Web Content Accessibility Guidelines (WCAG). For details, see Accessibility *(on page 60)*.

Evaluation Methods Used:

The following applications were used for testing **Oxygen XML Editor**:

- NVDA assistive technology
- JAWS assistive technology

Applicable Standards/Guidelines

This report covers the degree of conformance for the following accessibility standards/guidelines:

Standard/Guideline	Included In Report
Web Content Accessibility Guidelines 2.0	Level A - Yes Level AA - Yes Level AAA - No
Web Content Accessibility Guidelines 2.1	Level A - Yes Level AA - Yes Level AAA - No
Revised Section 508 standards published January 18, 2017 and corrected January 22, 2018	Yes
EN 301 549 Accessibility requirements suitable for public procurement of ICT products and services in Europe - V2.1.2 (2018-08)	No

Terms

The terms used in the Conformance Level information are defined as follows:

- **Supports**: The functionality of the product has at least one method that meets the criterion without known defects or meets with equivalent facilitation.
- **Partially Supports**: Some functionality of the product does not meet the criterion.
- **Does Not Support**: The majority of product functionality does not meet the criterion.
- **Not Applicable**: The criterion is not relevant to the product.
- **Not Evaluated**: The product has not been evaluated against the criterion. This can be used only in WCAG 2.0 Level AAA.

WCAG 2.x Report

Tables 1 and 2 also document conformance with:

Revised Section 508: Chapter 5 – 501.1 Scope, 504.2 Content Creation or Editing, and Chapter 6 – 602.3 Electronic Support Documentation.

Note:
When reporting on conformance with the WCAG 2.x Success Criteria, they are scoped for full pages, complete processes, and accessibility-supported ways of using technology as documented in theWCAG 2.0 Conformance Requirements.

Table 1: Success Criteria, Level A

Criteria	Conformance Level	Remarks and Explanations
1.1.1 Non-text Content (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Supports	Text alternatives are provided for non-text content.
1.2.1 Audio-only and Video-only (Prerecorded) (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Not Applicable	The product does not play audio and video content to end users.
1.2.2 Captions (Prerecorded) (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Not Applicable	The product does not provide pre-recorded media that requires captions.
1.2.3 Audio Description or Media Alternative (Prerecorded) (Level A) Also applies to: Revised Section 508	Not Applicable	The product does not provide pre-recorded media that requires alternate descriptions.

Criteria	Conformance Level	Remarks and Explanations
• 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)		
1.3.1 Info and Relationships (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Partially Supports	Information, structure, and relationships conveyed through presentation can be programmatically determined or are available in text, with exceptions that include: • **Grid** editing mode. • Schema **Design** editing mode. • The editing of profiling attributes using the **Edit profiling attributes** and **Insert/Edit Topic Reference** dialog boxes. • The editing of a DITA map in the **Author** editing mode.
1.3.2 Meaningful Sequence (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Supports	The product presents content in a meaningful sequence. Authors should use Unicode right-to-left mark (RLM) or left-to-right mark (LRM) to mix text direction inline.
1.3.3 Sensory Characteristics (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Supports	The product provides textual identification for understanding and operating content.
1.4.1 Use of Color (Level A)	Supports	Color is not used as the only visual means of conveying information, in-

Criteria	Conformance Level	Remarks and Explanations
Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)		dicating an action, prompting a response, or distinguishing a visual element.
1.4.2 Audio Control (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Not Applicable	There is no sound that plays automatically by default.
2.1.1 Keyboard (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Partially Supports	Most of the content is operable through a keyboard interface, with exceptions that include: • Some toolbars in the application not being accessible via a keyboard. • Combo boxes and buttons located inside the table from the dialog box used to create or edit a validation scenario.
2.1.2 No Keyboard Trap (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Partially Supports	The product does not usually have user interface elements that trap the keyboard focus. Exceptions include some trees located in side views and dialog boxes.

Criteria	Conformance Level	Remarks and Explanations
2.1.4 Character Key Shortcuts (Level A 2.1 only) Also applies to: Revised Section 508 – Does not apply	Not Applicable	The product does not include character key shortcuts.
2.2.1 Timing Adjustable (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Not Applicable	The product does not include time limits.
2.2.2 Pause, Stop, Hide (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Supports	Side views update their content automatically as a result of the user interaction with the open documents. They can be hidden or this functionality can be inhibited. The product does not include other elements that automatically move, blink, or scroll.
2.3.1 Three Flashes or Below Threshold (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Supports	The product does not have content that flashes more than three times in any one second.
2.4.1 Bypass Blocks (Level A) Also applies to:	Not Applicable	The application does not contain blocks of repeated content.

Criteria	Conformance Level	Remarks and Explanations
Revised Section 508 • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs		
2.4.2 Page Titled (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Supports	Each side view and dialog box in the application has a title.
2.4.3 Focus Order (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Supports	Focusable components receive focus in an order that preserves meaning and operability.
2.4.4 Link Purpose (In Context) (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Supports	The purpose of each link can be determined from the link text alone or from the link text together with its programmatically-determined link context.
2.5.1 Pointer Gestures (Level A 2.1 only) Also applies to:	Not Applicable	The product does not have functionality that requires multi-point or path-based gestures.

Criteria	Conformance Level	Remarks and Explanations
Revised Section 508 – Does not apply		
2.5.2 Pointer Cancellation (Level A 2.1 only) Also applies to: Revised Section 508 – Does not apply	Partially Supports	Almost all pointer operations in the product are activated on Up events. Exceptions may include selection changes in the dialog box for new files and in the side views.
2.5.3 Label in Name (Level A 2.1 only) Also applies to: Revised Section 508 – Does not apply	Supports	The names of the user interface components contain the text that is presented visually.
2.5.4 Motion Actuation (Level A 2.1 only) Also applies to: Revised Section 508 – Does not apply	Not Applicable	The product does not contain functionality that can be operated by device or user motion.
3.1.1 Language of Page (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Does Not Support	The product does not report the default language for each open document.
3.2.1 On Focus (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Supports	No changes of context occur when any component receives focus.

Criteria	Conformance Level	Remarks and Explanations
3.2.2 On Input (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Supports	Changing the setting of any user interface component does not automatically cause a change of context.
3.3.1 Error Identification (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Supports	Product shows error messages when user input is invalid.
3.3.2 Labels or Instructions (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Partially Supports	Most input areas in the product provide labels and instructions. Exceptions include the content completion windows in the **Text**, **Grid**, **Author**, and schema **Design** modes.
4.1.1 Parsing (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Supports	All labels presenting HTML content in the product have valid HTML content.

Criteria	Conformance Level	Remarks and Explanations
4.1.2 Name, Role, Value (Level A) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Partially Supports	Almost all visual components in the product have identifiable names and roles with exceptions that include: • **Grid** editing mode. • Schema **Design** editing mode.

Table 2: Success Criteria, Level AA

Criteria	Conformance Level	Remarks and Explanations
1.2.4 Captions (Live) (Level AA) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Not Applicable	The product does not contain live audio content.
1.2.5 Audio Description (Prerecorded) (Level AA) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Not Applicable	The product does not provide prerecorded video content that requires audio description.
1.3.4 Orientation (Level AA 2.1 only) Also applies to: Revised Section 508 – Does not apply	Supports	Content does not restrict its view and operation to a single display orientation.

Criteria	Conformance Level	Remarks and Explanations
1.3.5 Identify Input Purpose (Level AA 2.1 only) Also applies to: Revised Section 508 – Does not apply	Not Applicable	The content does not contain input fields that collect information about the user.
1.4.3 Contrast (Minimum) (Level AA) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Partially Supports	The product has sufficient contrast between the foreground and background colors, with few exceptions, including: • Change tracking content in the document for some of the author colors. • Change tracking content in some review panel items, when the item is selected. • Placeholders shown in empty elements. • Comments marked as done.
1.4.4 Resize text (Level AA) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Partially Supports	In most situations, text in the main editing area, side views, and dialog boxes can be resized to reasonable dimensions by increasing the font without loss of content or functionality and without using assistive technology. Sizes of certain text components cannot be increased.
1.4.5 Images of Text (Level AA) Also applies to: Revised Section 508	Supports	The few buttons with icons containing text characters also provide text alternatives.

Criteria	Conformance Level	Remarks and Explanations
• 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)		
1.4.10 Reflow (Level AA 2.1 only) Also applies to: Revised Section 508 – Does not apply	Partially Supports	The majority of the user interface controls can be presented without loss of information or functionality, and without requiring scrolling in two dimensions. In the editor area, the text will re-flow depending on the editor mode (Text/Grid/Author/Design) and both horizontal and vertical scrolls may be needed.
1.4.11 Non-text Contrast (Level AA 2.1 only) Also applies to: Revised Section 508 – Does not apply	Supports	User interface components and states have sufficient contrast against adjacent colors.
1.4.12 Text Spacing (Level AA 2.1 only) Also applies to: Revised Section 508 – Does not apply	Supports	There is no loss of content or functionality occurs by setting line height (line spacing), spacing following paragraphs, letter spacing, and word spacing.
1.4.13 Content on Hover or Focus (Level AA 2.1 only) Also applies to: Revised Section 508 – Does not apply	Partially Supports	The tooltips for most user interface simple components (buttons) are not hoverable and persistent.
2.4.5 Multiple Ways (Level AA) Also applies to: Revised Section 508	Supports	There are multiple ways to navigate between the open documents.

Criteria	Conformance Level	Remarks and Explanations
• 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs		
2.4.6 Headings and Labels (Level AA) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Supports	Headings and labels describe the topic or purpose.
2.4.7 Focus Visible (Level AA) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Partially Supports	The product has a visible indication of focus for almost all user interface controls (buttons, text fields, combo boxes, etc.) Exceptions include: • Combo boxes located in the **DITA Maps Manager** and **SharePoint Browser** view. • Filtering buttons located in the **Templates** tab from the **New/Edit scenario** and the **DITA Reusable Components** view. • Tab buttons located in the **Insert/Edit Topic Reference** dialog box.
3.1.2 Language of Parts (Level AA) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Does Not Support	The language of parts is not specified.

Criteria	Conformance Level	Remarks and Explanations
3.2.3 Consistent Navigation (Level AA) Also applies to: Revised Section 508 • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs	Supports	The product has a consistent navigation mechanism.
3.2.4 Consistent Identification (Level AA) Also applies to: Revised Section 508 • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs	Supports	The product components are identified consistently.
3.3.3 Error Suggestion (Level AA) Also applies to: Revised Section 508 • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)	Supports	The product provides suggestions for the input error if there are any available.
3.3.4 Error Prevention (Legal, Financial, Data) (Level AA) Also applies to: Revised Section 508	Not Applicable	The product does not process legal commitments or financial transactions or modify user-controllable data.

Criteria	Conformance Level	Remarks and Explanations
• 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs)		
4.1.3 Status Messages(Level AA 2.1 only) Also applies to: Revised Section 508 – Does not apply	Not Applicable	The product does not contain status messages as defined by this criterion.

Table 3: Success Criteria, Level AAA

Criteria	Conformance Level	Remarks and Explanations
1.2.6 Sign Language (Prerecorded) (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
1.2.7 Extended Audio Description (Prerecorded) (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
1.2.8 Media Alternative (Prerecorded) (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
1.2.9 Audio-only (Live) (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
1.3.6 Identify Purpose (Level AAA 2.1 only) Revised Section 508 – Does not apply	Not Evaluated	
1.4.6 Contrast Enhanced (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	

Criteria	Conformance Level	Remarks and Explanations
1.4.7 Low or No Background Audio (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
1.4.8 Visual Presentation (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
1.4.9 Images of Text (No Exception) Control (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
2.1.3 Keyboard (No Exception) (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
2.2.3 No Timing (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
2.2.4 Interruptions (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
2.2.5 Re-authenticating (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
2.2.6 Timeouts (Level AAA 2.1 only) Revised Section 508 – Does not apply	Not Evaluated	
2.3.2 Three Flashes (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
2.3.3 Animation from Interactions (Level AAA 2.1 only)	Not Evaluated	

Criteria	Conformance Level	Remarks and Explanations
Revised Section 508 – Does not apply		
2.4.8 Location (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
2.4.9 Link Purpose (Link Only) (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
2.4.10 Section Headings (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
2.5.5 Target Size (Level AAA 2.1 only) Revised Section 508 – Does not apply	Not Evaluated	
2.5.6 Concurrent Input Mechanisms (Level AAA 2.1 only) Revised Section 508 – Does not apply	Not Evaluated	
3.1.3 Unusual Words (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
3.1.4 Abbreviations (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
3.1.5 Reading Level (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
3.1.6 Pronunciation (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
3.2.5 Change on Request (Level AAA)	Not Evaluated	

Criteria	Conformance Level	Remarks and Explanations
Revised Section 508 – Does not apply		
3.3.5 Help (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	
3.3.6 Error Prevention (All) (Level AAA) Revised Section 508 – Does not apply	Not Evaluated	

Revised Section 508 Report

N/A

Chapter 3: Functional Performance Criteria (FPC)

Criteria	Conformance Level	Remarks and Explanations
302.1 Without Vision	Partially Supports	Much of the product is operable without vision. As noted in **1.3.1 Info and Relationships**, some structural and hierarchical information is not communicated to screen readers. Also, as noted in **2.1.1 Keyboard**, some components are not accessible via keyboard.
302.2 With Limited Vision	Supports	The product is operable with limited vision.
302.3 Without Perception of Color	Supports	Color is not used as the only visual means of conveying information, indicating an action, prompting a response, or distinguishing a visual element.
302.4 Without Hearing	Supports	The product does not require hearing for use.
302.5 With Limited Hearing	Supports	The product does not require hearing for use.

Criteria	Conformance Level	Remarks and Explanations
302.6 Without Speech	Supports	The product does not require speech for use.
302.7 With Limited Manipulation	Partially Supports	Most content of the product is operable for users with limited manipulation who rely on keyboard access. As noted in **2.1.1 Keyboard**, some components are not accessible via keyboard.
302.8 With Limited Reach and Strength	Supports	The product is functional with limited reach and limited strength. It supports operating system tools such as *StickyKeys* and *FilterKeys*.
302.9 With Limited Language, Cognitive, and Learning Abilities	Partially Supports	The product is operable by users with limited language, cognitive, and learning abilities. To accommodate users with limited cognition, the UI provides icons, text, or a combination of both, for controls. It provides the ability to change the interface language to 6 languages.

Chapter 4: Hardware

Notes: Not Applicable - **Oxygen XML Editor** is not a hardware product.

Chapter 5: Software

501 General

Criteria	Conformance Level	Remarks and Explanations
501.1 Scope – Incorporation of WCAG 2.0 AA	See WCAG 2.x section *(on page 65)*	See information in WCAG section

502 Interoperability with Assistive Technology

Criteria	Conformance Level	Remarks and Explanations
502.2.1 User Control of Accessibility Features	Not Applicable	The product is not platform software.

Criteria	Conformance Level	Remarks and Explanations
502.2.2 No Disruption of Accessibility Features	Supports	The product does not disrupt platform features that are defined in the platform documentation as accessibility features.

502.3 Accessibility Services

Criteria	Conformance Level	Remarks and Explanations
502.3.1 Object Information	Partially Supports	Most of the object information can be programmatically determined. As noted in **1.3.1 Info and Relationships**, the content from the **Grid** and schema **Design** editing modes is not exposed programmatically.
502.3.2 Modification of Object Information	Partially Supports	States and properties that can be set by the user can be set programmatically. As noted in **1.3.1 Info and Relationships**, there are few exceptions.
502.3.3 Row, Column, and Headers	Partially Supports	The insert table feature in the editing area of the product does not communicate information about the headers. Row and column information is presented in a way that can be used by assistive technology.
502.3.4 Values	Partially Supports	The current values of an object can be programmatically determined. As noted in **1.3.1 Info and Relationships**, there are few exceptions. The content from the **Grid** and schema **Design** editing modes is not exposed programmatically.
502.3.5 Modification of Values	Partially Supports	Values that can be set by the user are capable of being set programmatically. As noted in **1.3.1 Info and Relationships**, there are few exceptions. The content from the **Grid** and schema **De-**

Criteria	Conformance Level	Remarks and Explanations
		sign editing modes cannot be set programmatically.
502.3.6 Label Relationships	Partially Supports	Information, structure, and relationships conveyed through presentation can be programmatically determined or are available in text. As noted in **1.3.1 Info and Relationships**, there are few exceptions.
502.3.7 Hierarchical Relationships	Partially Supports	The hierarchical relationships are, in general, accessible programmatically, but as noted in **1.3.1 Info and Relationships**, there are few exceptions.
502.3.8 Text	Partially Supports	The content of text objects, text attributes, and the boundary of text rendered to the screen is programmatically determinable. As noted in **1.3.1 Info and Relationships**, there are few exceptions, including the text from the **Grid** and schema **Design** modes.
502.3.9 Modification of Text	Partially Supports	Text can be set programmatically, including through assistive technology. Text in the editor can be modified using the keyboard. As noted in **1.3.1 Info and Relationships**, the text content from the **Grid** and schema **Design** editing modes cannot be accessed programmatically.
502.3.10 List of Actions	Supports	Actions that can be executed on an object can be determined programmatically from the context menu or content completion menu.
502.3.11 Actions on Objects	Supports	Actions on objects can performed by users, including those using assistive technologies.
502.3.12 Focus Cursor	Partially Supports	The focus location, selection state, and text insertion point information

Criteria	Conformance Level	Remarks and Explanations
		can be determined programmatically. As noted in **1.3.1 Info and Relationships**, the content from the **Grid** and schema **Design** editing modes is not exposed programmatically.
502.3.13 Modification of Focus Cursor	Partially Supports	The focus location, selection state and text insertion can be controlled programmatically or through the keyboard. As noted in **1.3.1 Info and Relationships**, the content from the **Grid** and schema **Design** editing modes cannot be accessed programmatically.
502.3.14 Event Notification	Supports	The changes in states and other properties are communicated through notifications that are communicated to assistive technology.
502.4 Platform Accessibility Features	Not Applicable	This product is not platform software.

503 Applications

Criteria	Conformance Level	Remarks and Explanations
503.2 User Preferences	Partially Supports	The product permits some of the user preferences from platform settings. Exceptions include • Cursor thickness is not modified in **Text**, **Author**, and **Grid** editing modes. • Some elements may not use the platform font size. The product provides custom preferences for changing the color, font type, and font size.
503.3 Alternative User Interfaces	Not Applicable	The application does not provide an alternative user interface that functions as assistive technology.

503.4 User Controls for Captions and Audio Description

Criteria	Conformance Level	Remarks and Explanations
503.4.1 Caption Controls	Not Applicable	The product does not provide controls for volume adjustment.
503.4.2 Audio Description Controls	Not Applicable	The product does not provide controls for program selection.

504 Authoring Tools

Criteria	Conformance Level	Remarks and Explanations
504.2 Content Creation or Editing (if not authoring tool, enter “not applicable”)	See the WCAG 2.x section *(on page 65)*	See information in WCAG section
504.2.1 Preservation of Information Provided for Accessibility in Format Conversion	Partially Supports	For the main XML vocabulary supported in the application (DITA), the accessibility information is preserved in the generated main formats (WebHelp, PDF).
504.2.2 PDF Export	Supports	The product is capable of publishing PDF files that conform to PDF/UA-1.
504.3 Prompts	Partially Supports	For DITA documents, there is an optional Schematron that performs accessibility checks on the content and prompts the authors whenever it detects errors.
504.4 Templates	Does Not Support	The product does provide several templates. However, these templates offer only minimal structure and do not mark content in ways that promote following the WCAG success criteria. The existing templates can be customized.

Chapter 6: Support Documentation and Services

601.1 Scope

602 Support Documentation

Criteria	Conformance Level	Remarks and Explanations
602.2 Accessibility and Compatibility Features	Partially Supports	The documentation of the product lists and explains the accessibility and compatibility features of the product.
602.3 Electronic Support Documentation	Partially Supports	The self-service documentation is generated with **Oxygen XML WebHelp**. You can find its VPAT statement here.
602.4 Alternate Formats for Non-Electronic Support Documentation	Not Applicable	Documentation is not provided in non-electronic formats.

603 Support Services

Criteria	Conformance Level	Remarks and Explanations
603.2 Information on Accessibility and Compatibility Features	Supports	The support services cover the accessibility features.
603.3 Accommodation of Communication Needs	Supports	Support is provided over a variety of channels including email and phone.

Legal Disclaimer

This report describes **Oxygen XML Editor** ability to support the stated VPAT Standards/Guidelines, subject to Syncro Soft's interpretation of the same. This accessibility report is provided for informational purposes only, and the contents hereof are subject to change without notice. SYNCRO SOFT MAKES NO WARRANTIES, EXPRESS OR IMPLIED, IN THIS DOCUMENT. For more information regarding the accessibility status, please contact us at *sales@oxygenxml.com*.

3.

Installation

Oxygen XML Editor is available on Windows, Linux, and macOS and there are a variety of methods and options for installing and running Oxygen XML Editor on your system or server. This section also includes information about registering, transferring, or releasing licenses, upgrading, installing *add-ons*, and uninstalling.

Choosing How Oxygen XML Editor Runs

You can install Oxygen XML Editor to run in several ways:

- As a desktop application (running standalone or as an Eclipse plugin) on Windows, Linux, or macOS.
- As a desktop application (running standalone or as an Eclipse plugin) on a Unix or Linux server or on Windows Terminal Server.

Choosing an Installer

You also have a choice of several different installers:

- The native installer for your platform (Windows, Linux, or macOS).
- On Windows and Linux, the native installer can also run in unattended mode.

Choosing a License Option

You must obtain and register a license *(on page 105)* to run Oxygen XML Editor.

You can choose from two types of licenses:

- A named-user license, which can be used by a single person on multiple computers.
- A floating license, which can be used by different people at different times. Only one person can use a floating license at a time.

Upgrading, Transferring, and Uninstalling.

You can also upgrade *(on page 124)* Oxygen XML Editor, transfer a license *(on page 107)*, or uninstall *(on page 130)* Oxygen XML Editor.

Getting Help With Installation

If you need help, email support at: support@oxygenxml.com.

Installing Oxygen XML Editor on Windows

System Requirements

Operating Systems

The product has been fully tested on Windows versions 10 and 11. The latest version of Oxygen XML Editor might work on other versions of Windows, but they have not been officially tested.

CPU

- Minimum - Intel/AMD Dual-core class CPU, 2 GHz
- Recommended - Quad-core class processor

Memory

- Minimum - 3 GB of RAM
- Recommended - 8 GB of RAM

Storage

- Minimum - 1 GB free disk space
- Recommended - 2 GB free disk space

Java

Oxygen XML Editor only officially supports Java Virtual Machines with version 17 from Oracle or Eclipse Adoptium. If you use the native Windows installer, Oxygen XML Editor will be installed with its own copy of Java with the specific update version that has been thoroughly tested.

All Platforms Package

If you use the all platforms package, your system must have a compatible Java 17 virtual machine installed. To see the exact Java update version that is supported, go to www.oxygenxml.com, navigate to the **Download** page for the particular product you are installing, and click on the tab for your particular platform.

Note:
Oxygen XML Editor may work with other versions of Java, but since Oxygen XML Editor has only been thoroughly tested with specific versions, there is no guarantee that it will be stable with any other Java version.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you install using the native Windows installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Windows environment variable `JAVA_HOME` is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your PATH environment variable is used.

If you run Oxygen XML Editor using the batch file, `oxygen.bat`, you can edit the batch file to specify a particular version to use.

Windows Installer

To install Oxygen XML Editor using the Windows installer, follow these steps:

1. Make sure that your system meets the system requirements *(on page 89)*.
2. Download the Windows installer.
3. [Optional] Validate the integrity of the downloaded file by checking it against the MD5 sum published on the download page.
4. Run the installer and follow the instructions in the installation program.
5. Start Oxygen XML Editor using one of the following methods:
   - Use one of the shortcuts created by the installer.
   - Run `oxygen.bat`, which is located in the installation directory.
6. To license your copy of Oxygen XML Editor, go to **Help > Register** and enter your license information *(on page 105)*.

Windows Unattended Installation

You can run the installation in unattended mode by running the installer from the command line with the **-q** parameter. By default, running the installer in unattended mode installs Oxygen XML Editor with the default options and does not overwrite existing files. You can change various options for the unattended installer using the installer command-line parameters.

Windows Installer Command-Line Reference

The Oxygen XML Editor installer for Windows supports a variety of command-line parameters:

-q

Instructs the installer to run in unattended mode. The installer will not prompt the user for input during the install. Default settings will be used for all options unless a `response.varfile` *(on page 93)* is specified using the `-varfile` option.

-overwrite

In unattended mode, the installer does not overwrite files with the same name if a previous version of the Oxygen XML Editor is installed in the same folder. The **-overwrite** parameter added after the **-q** parameter forces the overwriting of these files.

-console

Displays a console during an unattended installation.

> **Note:**
> If you want the installer to run in the foreground, you need to use the **start /wait** command (for example, `start /wait oxygen.exe -q -console`). Otherwise, it will run in the background.

-varfile

Specifies the location of a `response.varfile` *(on page 93)*, normally to be used during an unattended installation.

-c

Allows users to configure the installation by inputting answers to installation questions in the command line.

> **Tip:**
> Using this parameter is the best way to use the installer for people who are visually impaired.

-V[variable name]=[variable value]

This command-line parameter can be used to define any of the variables listed below to be used by an installation.

EXAMPLE:

```
oxygen.exe -q -overwrite -console -VautoVersionChecking=false
```

Command-Line Variables for Preconfiguring License Server Details

For organizations that use a license server to manage user licenses, the Oxygen XML Editor installer also supports the following command-line variables used for preconfiguring license server details:

autoVersionChecking

Used for automatic version checking. Possible values are **true** (default) or **false**.

backup.license.servlet.url

Specifies the URL of the backup HTTP license server.

backup.license.servlet.user.name

Specifies the user name for the backup HTTP license server.

backup.license.servlet.password

Specifies the password for the backup HTTP license server, in clear form (will be stored encrypted).

backup.license.servlet.password.encrypted

Specifies the password for the HTTP license server, in encrypted form. Can be obtained from an entry with the same name in an existing `license.xml` file (found in: `[user_home_directory]\AppData\Roaming\com.oxygenxml`).

downloadResources

Used to download resources (links to video demonstrations, webinars, and upcoming events) from https://www.oxygenxml.com to populate the application welcome screen. Possible values are **true** (default) or **false**.

license.servlet.url

Specifies the URL of the HTTP license server.

license.servlet.user.name

Specifies the user name for the HTTP license server.

license.servlet.password

Specifies the password for the HTTP license server, in clear form (will be stored encrypted).

license.servlet.password.encrypted

Specifies the password for the HTTP license server, in encrypted form. Can be obtained from an entry with the same name in an existing `license.xml` file (found in: `[user_home_directory]\AppData\Roaming\com.oxygenxml`).

reportProblem

Used to report a problem encountered while using Oxygen XML Editor. Possible values are **true** (default) or **false**.

EXAMPLE:

```
oxygen.exe "-Vlicense.servlet.url=http://
main.licenseserver:8080/oXygenLicenseServlet/license-servlet"
 "-Vlicense.servlet.user.name=user" "-Vlicense.servlet.password=mypass"
 "-Vbackup.license.servlet.url=http://
backup.licenseserver:8080/oXygenLicenseServlet/license-servlet"
 "-Vbackup.license.servlet.user.name=user" "-Vbackup.license.servlet.password=mypass"
```

Note:
For information about deploying and registering floating licenses for multiple users, see Registering Floating Licenses for Multiple Users *(on page 112)*.

Windows Installer *response.varfile*

The Oxygen XML Editor installer for Windows also creates a file called `response.varfile`, which records the choices that the user made when running the installer interactively. The generated response file is found in the `[OXYGEN_INSTALL_DIR]/.install4j` folder. You can use the `response.varfile` to set the options for an unintended install *(on page 90)*. For more information about the `response.varfile` format, see install4j site.

Variables (can be used in the `response.varfile` or from the command line)

The following variables are supported in the `response.varfile` (or from the command line):

autoVersionChecking

Used for automatic version checking. Possible values are **true** (default) or **false**.

downloadResources

Used to download resources (links to video demonstrations, webinars, and upcoming events) from https://www.oxygenxml.com to populate the application welcome screen. Possible values are **true** (default) or **false**.

reportProblem

Used to report a problem encountered while using Oxygen XML Editor. Possible values are **true** (default) or **false**.

Installing Oxygen XML Editor on macOS

System Requirements

Operating system

The product has been fully tested on macOS 11 (Big Sur), 12 (Monterey), 13 (Ventura), and 14 (Sonoma). The latest version of Oxygen XML Editor might work on older versions of macOS, but they have not been officially tested.

CPU

- Minimum - Intel-based Dual-core Mac, 2 GHz
- Recommended - Apple M1 or newer

Memory

- Minimum - 4 GB of RAM
- Recommended - 8 GB of RAM

Storage

- Minimum - 1 GB free disk space
- Recommended - 2 GB free disk space

macOS Installation

To install Oxygen XML Editor on macOS, follow these steps:

1. Download the macOS installation package (oxygen.dmg).
2. [Optional] Validate the integrity of the downloaded file by checking it against the MD5 sum published on the download page.
3. Double-click the oxygen.dmg disk image file to mount it.
4. Drag/Copy the *Oxygen XML Editor* folder to your `/Applications` folder (or another location if you wish).

   Warning:
   If you receive a warning that an *Oxygen XML Editor* installation folder already exists in the `Applications` folder, do not attempt to merge the two installations. Instead, move the old installation folder to the trash bin before installing the application. If you are prompted to **Replace** the old folder, cancel the installation, move the old folder to the trash bin, and restart the installation process.

   Important:
   Do not copy the files/folders from within the *Oxygen XML Editor* folder (always copy the folder itself), otherwise you will omit invisible files/folders and the application may no longer start.

5. Start Oxygen XML Editor, using one of the following methods:
   - Double-click `Oxygen XML Editor.app`.
   - Run `sh oxygen.sh` in the command-line interface.
6. To license your copy of Oxygen XML Editor, go to **Help > Register** to enter your license key *(on page 105)*.

macOS Unattended Installation

To install Oxygen XML Editor on macOS in unattended mode, follow these steps:

1. Download the macOS installation package (oxygen.dmg).
2. Mount the oxygen.dmg file in the command line.

   ```
   hdiutil attach oxygen.dmg|oxygenAuthor.dmg|oxygenDeveloper.dmg
   ```

3. Copy the `oxygen` folder for the particular version from the mounted volume to the `Applications` folder (or another folder where you want to install it), as in the following example:

   ```
   cp -aR "/Volumes/Oxygen XML Editor 26.1/Oxygen XML Editor" /Applications/|
   ```

4. Eject the mounted disc image:

```
hdiutil detach "/Volumes/Oxygen XML Editor 26.1"|
```

Note:
For information about deploying and registering floating licenses for multiple users, see Registering Floating Licenses for Multiple Users *(on page 112)*.

Installing Oxygen XML Editor on Linux

System Requirements

Operating System

The product has been fully tested on Ubuntu 22.04. The latest version of Oxygen XML Editor might work on other flavors/versions of Linux, but they have not been officially tested.

CPU

- Minimum - Intel/AMD Dual-core class CPU, 2 GHz
- Recommended - Quad-core class processor

Memory

- Minimum - 3 GB of RAM
- Recommended - 8 GB of RAM

Storage

- Minimum - 1 GB free disk space
- Recommended - 2 GB free disk space

Java

Oxygen XML Editor only officially supports Java Virtual Machines with version 17 from Oracle or Eclipse Adoptium. If you use the Linux installer, Oxygen XML Editor will be installed with its own copy of Java with the specific update version that has been thoroughly tested.

All Platforms Package

If you use the all platforms package, your system must have a compatible Java 17 virtual machine installed. To see the exact Java update version that is supported, go to www.oxygenxml.com, navigate to the **Download** page for the particular product you are installing, and click on the tab for your particular platform.

> **Note:**
> Oxygen XML Editor may work with other versions of Java, but since Oxygen XML Editor has only been thoroughly tested with specific versions, there is no guarantee that it will be stable with any other Java version.

> **Attention:**
> Oxygen XML Editor does not work with the **GNU libgcj** Java Virtual Machine.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you used the Linux installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Linux environment variable `JAVA_HOME` is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your PATH environment variable is used.

You can also change the version of the Java Virtual Machine that runs Oxygen XML Editor by editing the script file, `oxygen.sh`.

X.org

The version of Java bundled with Oxygen XML Editor requires **X.org** (Wayland is not supported).

Linux Installer

To install Oxygen XML Editor using the Linux installer, follow these steps:

1. Make sure that your system meets the system requirements *(on page 95)*.
2. Download the Linux installer.
3. [Optional] Validate the integrity of the downloaded file by checking it against the MD5 sum published on the download page.
4. Run the installer and follow the instructions in the installation program.

> **Note:**
> For example, open a shell, `cd` to the installation directory, and at the prompt type `sh ./oxygen-32bit.sh` or `sh ./oxygen-64bit.sh`, depending on which installer you downloaded.

Warning:
If you are running the installer as root and your Linux distribution uses Wayland (such as **Ubuntu 17.10** or **Fedora 25**), before running the installer, the local user must first allow the root user to access the X server by running the following command (as the local user):

```
xhost +SI:localuser:root
```

5. Start Oxygen XML Editor using one of the following methods:
   - Use the `oxygen` shortcut created by the installer.

Note:
For **Ubuntu 17.10** (or later), a security dialog box will appear the first time you start the application where you need to select **Trust and Launch** to continue. This dialog box will not appear on subsequent launches.

   - From a command line, type `sh oxygen.sh`. This file is located in the installation folder.
6. To license your copy of Oxygen XML Editor go to **Help > Register** and enter your license information *(on page 105)*.

Linux Unattended Installation

You can run the installation in unattended mode by running the installer from the command line with the **-q** parameter. By default, running the installer in unattended mode installs Oxygen XML Editor with the default options and does not overwrite existing files. You can change various options for the unattended installer using the installer command-line parameters.

Linux Installer Command-Line Reference

The Oxygen XML Editor installer for Linux supports a variety of command-line parameters:

-q

Instructs the installer to run in unattended mode. The installer will not prompt the user for input during the install. Default settings will be used for all options unless a `response.varfile` *(on page 99)* is specified using the *-varfile* option.

-overwrite

In unattended mode, the installer does not overwrite files with the same name if a previous version of the Oxygen XML Editor is installed in the same folder. The **-overwrite** parameter added after the **-q** parameter forces the overwriting of these files.

-console

Displays a console during the installation.

-varfile

Specifies the location of a `response.varfile` *(on page 99)*, normally to be used during an unattended installation.

-V

Used to define a variable parameter *(on page 99)* to be used by an installation.

EXAMPLE:

```
oxygen.sh -q -overwrite -console -VautoVersionChecking=false
```

Command-Line Variables for Preconfiguring License Server Details

For organizations that use a license server to manage user licenses, the Oxygen XML Editor installer also supports the following command-line variables used for preconfiguring license server details:

autoVersionChecking

Used for automatic version checking. Possible values are **true** (default) or **false**.

backup.license.servlet.url

Specifies the URL of the backup HTTP license server.

backup.license.servlet.user.name

Specifies the user name for the backup HTTP license server.

backup.license.servlet.password

Specifies the password for the backup HTTP license server, in clear form (will be stored encrypted).

backup.license.servlet.password.encrypted

Specifies the password for the HTTP license server, in encrypted form. Can be obtained from an entry with the same name in an existing `license.xml` file (found in: `[user_home_directory]\AppData\Roaming\com.oxygenxml`).

downloadResources

Used to download resources (links to video demonstrations, webinars, and upcoming events) from https://www.oxygenxml.com to populate the application welcome screen. Possible values are **true** (default) or **false**.

license.servlet.url

Specifies the URL of the HTTP license server.

license.servlet.user.name

Specifies the user name for the HTTP license server.

license.servlet.password

Specifies the password for the HTTP license server, in clear form (will be stored encrypted).

license.servlet.password.encrypted

Specifies the password for the HTTP license server, in encrypted form. Can be obtained from an entry with the same name in an existing `license.xml` file (found in: `[user_home_directory]\AppData\Roaming\com.oxygenxml`).

reportProblem

Used to report a problem encountered while using Oxygen XML Editor. Possible values are **true** (default) or **false**.

EXAMPLE:

```
oxygen.sh "-Vlicense.servlet.url=http://
main.licenseserver:8080/oXygenLicenseServlet/license-servlet"
 "-Vlicense.servlet.user.name=user" "-Vlicense.servlet.password=mypass"
 "-Vbackup.license.servlet.url=http://
backup.licenseserver:8080/oXygenLicenseServlet/license-servlet"
 "-Vbackup.license.servlet.user.name=user" "-Vbackup.license.servlet.password=mypass"
```

Note:
For information about deploying and registering floating licenses for multiple users, see Registering Floating Licenses for Multiple Users *(on page 112)*.

Linux Installer *response.varfile*

The Oxygen XML Editor installer for Linux also creates a file called `response.varfile`, which records the choices that the user made when running the installer interactively. The generated response file is found in the `[OXYGEN_INSTALL_DIR]/.install4j` folder. You can use the `response.varfile` to set the options for an unintended install *(on page 97)*. For more information about the `response.varfile` format, see install4j site.

Variable Parameters (can be used in the *response.varfile* or from the command line)

The following variable parameters are supported in the `response.varfile` (or from the command line):

autoVersionChecking

Used for automatic version checking. Possible values are **true** (default) or **false**.

reportProblem

Used to report a problem encountered while using Oxygen XML Editor. Possible values are **true** (default) or **false**.

downloadResources

Used to download resources (links to video demonstrations, webinars, and upcoming events) from https://www.oxygenxml.com to populate the application welcome screen. Possible values are **true** (default) or **false**.

Installing Oxygen XML Editor on Windows Server

System Requirements

Operating systems

Windows Server 2012 or Windows Server 2012 R2

CPU

- Minimum - Intel/AMD Dual-core class CPU, 2 GHz
- Recommended - Quad-core class processor

Memory

- Minimum values per user - 1 GB of RAM
- Recommended values per concurrent user - 2 GB of RAM

Storage

- Minimum - 1 GB free disk space
- Recommended - 2 GB free disk space

Java

Oxygen XML Editor only officially supports Java Virtual Machines with version 17 from Oracle or Eclipse Adoptium. If you use the native Windows installer, Oxygen XML Editor will be installed with its own copy of Java with the specific update version that has been thoroughly tested.

All Platforms Package

If you use the all platforms package, your system must have a compatible Java 17 virtual machine installed. To see the exact Java update version that is supported, go to www.oxygenxml.com, navigate to the **Download** page for the particular product you are installing, and click on the tab for your particular platform.

Note:
Oxygen XML Editor may work with other versions of Java, but since Oxygen XML Editor has only been thoroughly tested with specific versions, there is no guarantee that it will be stable with any other Java version.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you install using the native Windows installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Windows environment variable `JAVA_HOME` is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your PATH environment variable is used.

If you run Oxygen XML Editor using the batch file, `oxygen.bat`, you can edit the batch file to specify a particular version to use.

Windows Installer

To install Oxygen XML Editor using the Windows installer, follow these steps:

1. Make sure that your system meets the system requirements *(on page 100)*.
2. Download the Windows installer.
3. [Optional] Validate the integrity of the downloaded file by checking it against the MD5 sum published on the download page.
4. Run the installer and follow the instructions in the installation program.
5. Start Oxygen XML Editor using one of the following methods:
   - Use one of the shortcuts created by the installer.
   - Run `oxygen.bat`, which is located in the installation directory.
6. To license your copy of Oxygen XML Editor go to **Help > Register** and enter your license information *(on page 105)*.

Configuring Windows Terminal Server

1. Install Oxygen XML Editor on the server and make its shortcuts available to all users.
2. Make sure you allocate sufficient memory to Oxygen XML Editor by adding the `-Xmx` parameter either in the *.bat* startup script *(on page 349)*, or in the *.vmoptions* configuration file *(on page 351)* (if you start it from an executable launcher).

Installing Oxygen XML Editor on a Linux / UNIX Server

System Requirements

Operating system

The product has been fully tested on Ubuntu 22.04. The latest version of Oxygen XML Editor might work on other flavors/versions of Linux, but they have not been officially tested.

CPU

- Minimum - Intel/AMD Dual-core class CPU, 2 GHz
- Recommended - Quad-core class processor

Memory

- Minimum - 3 GB of RAM
- Recommended - 8 GB of RAM

Storage

- Minimum - 1 GB free disk space
- Recommended - 2 GB free disk space

Java

Oxygen XML Editor only officially supports Java Virtual Machines with version 17 from Oracle or Eclipse Adoptium. If you use the Linux installer, Oxygen XML Editor will be installed with its own copy of Java with the specific update version that has been thoroughly tested.

All Platforms Package

If you use the all platforms package, your system must have a compatible Java 17 virtual machine installed. To see the exact Java update version that is supported, go to www.oxygenxml.com, navigate to the **Download** page for the particular product you are installing, and click on the tab for your particular platform.

Note:
Oxygen XML Editor may work with other versions of Java, but since Oxygen XML Editor has only been thoroughly tested with specific versions, there is no guarantee that it will be stable with any other Java version.

Attention:
Oxygen XML Editor does not work with the **GNU libgcj** Java Virtual Machine.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you used the Linux installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Linux environment variable `JAVA_HOME` is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your PATH environment variable is used.

You can also change the version of the Java Virtual Machine that runs Oxygen XML Editor by editing the script file, `oxygen.sh`.

Linux Installer

To install Oxygen XML Editor using the Linux installer, follow these steps:

1. Make sure that your system meets the system requirements *(on page 101)*.
2. Download the Linux installer.
3. [Optional] Validate the integrity of the downloaded file by checking it against the MD5 sum published on the download page.
4. Run the installer and follow the instructions in the installation program.

   Note:
   For example, open a shell, `cd` to the installation directory, and at the prompt type `sh ./oxygen-32bit.sh` or `sh ./oxygen-64bit.sh`, depending on which installer you downloaded.

5. Start Oxygen XML Editor using one of the following methods:
   - Use the `oxygen` shortcut created by the installer.
   - From a command line, type `sh oxygen.sh`. This file is located in the installation folder.
6. To license your copy of Oxygen XML Editor go to **Help > Register** and enter your license information *(on page 105)*.

Unix/Linux Server Configuration

1. Install Oxygen XML Editor on the server and make sure the oxygen.sh script is executable and the installation directory is in the PATH of the users that need to use the application.
2. Make sure you allocate sufficient memory to Oxygen XML Editor by setting an appropriate value for the `-Xmx` parameter in the `.sh` startup script.

   Note:
   The default value of the `-Xmx` parameter is about a quarter of the maximum internal memory available on the machine. To avoid performance issues with large documents *(on page 3033)*, you may need to adjust it.

3. Make sure the X server processes located on the workstations allow connections from the server host. For this, use the `xhost` command.
4. Start telnet (or ssh) on the server host.
5. Start an *xterm* process with the **display** parameter set on the current workstation. For example: `xterm -display workstationip:0.0`.
6. Start Oxygen XML Editor by typing `sh oxygen.sh` from the command line. This file is located in the installation folder.

Site-Wide Deployment

If you are deploying Oxygen XML Editor for a group, there are various things you can do to customize Oxygen XML Editor for your users and to make the deployment more efficient.

Creating custom default options

You can create a custom set of default options *(on page 318)* for Oxygen XML Editor. These will become the default options for each of your users, replacing the normal default settings. Users can still set options to suit themselves in their own copies of Oxygen XML Editor, but if they choose to reset their options to defaults, the custom defaults that you set will be used.

Creating default project files

Oxygen XML Editor project files *(on page 409)* are used to configure a project. You can create and deploy default project files *(on page 409)* for your projects so that your users will have a preconfigured project file to begin work with.

Shared project files

Rather than each user having their own project file, you can create and deploy shared project files *(on page 425)* so that all users share the same project configuration and settings and automatically inherit all project changes.

Using the unattended installer

You can speed up the installation process by using the unattended installer for Windows *(on page 90)* or Linux *(on page 97)* installs.

Using floating licenses

If you have a number of people using Oxygen XML Editor on a part-time basis or in different time zones, you can use a floating license *(on page 109)* so that multiple people can share a license.

Licensing

This section contains information about licensing Oxygen XML Editor, including details about the types of licenses that are available, managing licenses, using a license server to manage licences for an organization, and information about managing license servers.

Installing a License Server to Manage Licenses

If you are using floating licenses or a large number of user-based licenses (20 or more) for **Oxygen XML Editor/Author/Developer**, you must set up an Oxygen License Server *(on page 112)*.

Registering License Keys

To help you comply with the **Oxygen** EULA (terms of licensing), all floating or named-user licenses must be registered. This means that the license key will be locked to a particular license server deployment and no multiple uses of the same license key are possible.

During the activation process, a code that uniquely identifies your deployment of the license server is sent to the **Oxygen** servers. The servers will then sign the license key.

Splitting or Combining License Keys to Work with Your License Servers

A license server can only manage one license key. If you have multiple license keys for the same version of **Oxygen XML Editor/Author/Developer** and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, contact the Oxygen support team and ask for a new license key.

You can obtain a license key for Oxygen XML Editor in one of the following ways:

- You can purchase one or more licenses from the Oxygen XML Editor website at https://www.oxygenxml.com/buy.html or through one of the authorized resellers. A license key will be sent to you by email.
- If your company or organization has already purchased licenses, contact your license administrator to obtain a license key or configuration details to connect to a license server.
- If you purchased a subscription and you received a registration code, you can use it to obtain a license key from https://www.oxygenxml.com/registerCode.html. A license key will be sent to you by email.
- If you want to evaluate the product, you can obtain a trial license key for 30 days from the Oxygen XML Editor website at https://www.oxygenxml.com/register.html.

License Types

Oxygen XML Editor is not free software. To activate and use Oxygen XML Editor, you need a license.

The following license types are available:

- A **Named-User License** *(on page 106)* may be used by a single *Named User* on one or more computers. Named-user licenses are not transferable to a new *Named User*. If you order multiple named-user licenses, you will receive a single license key good for a specified number of *named users*. It is your responsibility to keep track of the *named users* that each license is assigned to.
- A **Floating License** *(on page 109)* may be used by any user on any machine. However, the total number of copies of Oxygen XML Editor in use at one time must not be more than the number of floating licenses available. A user who runs two different distributions of Oxygen XML Editor (for example, Standalone and Eclipse Plugin) at the same time on the same computer, consumes a single floating license.
- A **Subscription** license that allows you to use the application for a specific period of time (either 6 months or 1 year). This type of license is user-based and is covered by a Support and Maintenance Pack, which means that during the subscription period you will get free upgrades to all major and minor releases and priority technical support.
- A special **Academic Group License** (*Classroom*, *Department*, or *Site* license) may be used by students and teachers in academic institutions. These licenses provide a cost effective way of getting access to Oxygen XML Editor for learning purposes.

For demonstration and evaluation purposes, a time-limited license is available upon request at https://www.oxygenxml.com/register.html. This license is supplied at no cost for a period of 30 days from the date of issue. During this period, the software is fully functional, enabling you to test all its functionality. To continue using the software after the trial period, you must purchase a permanent license.

For definitions and legal details of the license types, consult the End-User License Agreement available at https://www.oxygenxml.com/eula.html.

Named-User Licenses

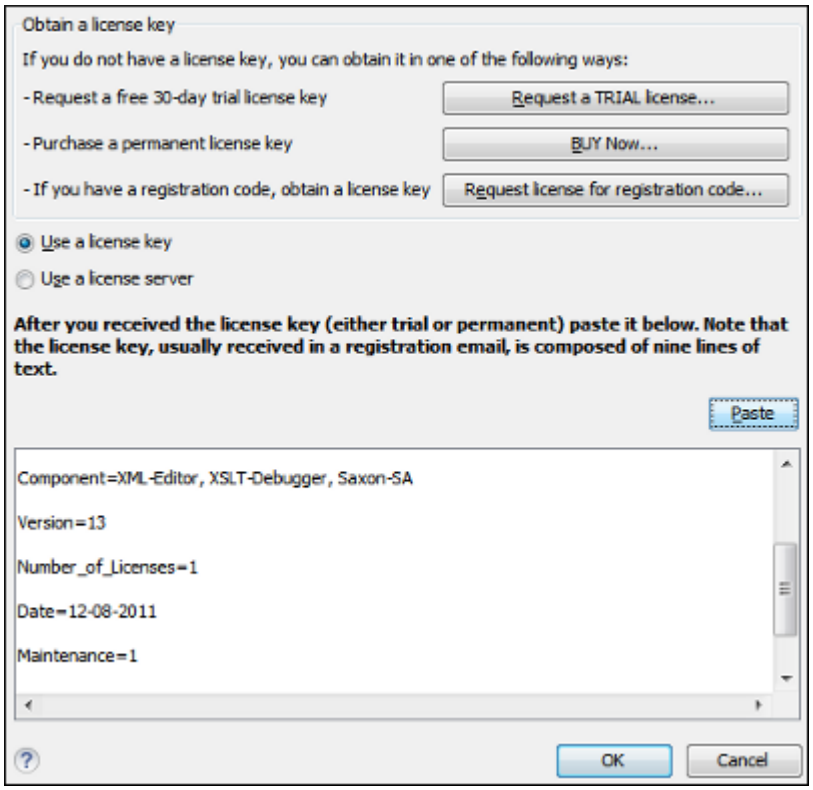
A **Named-User License** can be used by a single *Named User* on one or more computers. Named-user licenses cannot be transferred to another *named user*. If you purchase multiple named-user licenses, you will receive a single license key that is valid for a specified number of *named users*. It is your responsibility to keep track of which *named users* are assigned to each license.

Registering a Named-User License

To register a *Named-User License* on a machine owned by the *Named User*, follow these steps:

1. Purchase a license from the Oxygen XML Editor website. You will receive an email that contains your license key.
2. Save a backup copy of your email message that contains the new license key.
3. Start Oxygen XML Editor.
   If this is a new installation of Oxygen XML Editor, the registration dialog box is displayed. If the registration dialog box is not displayed, go to **Help > Register**.

Figure 11. License Registration Dialog Box



4. Select **Use a license key** as the licensing method.

   > **Note:**
   > If your license key has 20 or more licenses, you must use a license server *(on page 104)* instead.

5. Paste your license key into the registration dialog box. The license key is composed of nine lines of text between two text markers.
6. Click **OK**.

Oxygen XML Editor End-User License Agreement

Transferring a License Key

If you want to transfer your Oxygen XML Editor license key to another computer (for example, if you are disposing of your old computer or transferring it to another person), you must first unregister your license. You can then register your license on the new computer in the normal way.

To unregister a license, prior to transferring it, follow this procedure:

1. Go to **Help > Register**.
   The license registration dialog box is displayed.
2. Make sure the **Use a license key** option is selected.
3. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.
4. Click the **Remove** button at the bottom-right corner of the dialog box.
   A confirmation message is displayed asking if you want to remove your license key.
5. Select between:
   - **Yes** - Removes your license key from your user account on the current computer.
   - **No** - Falls back to your previous license key, if applicable.

Subscription Licenses

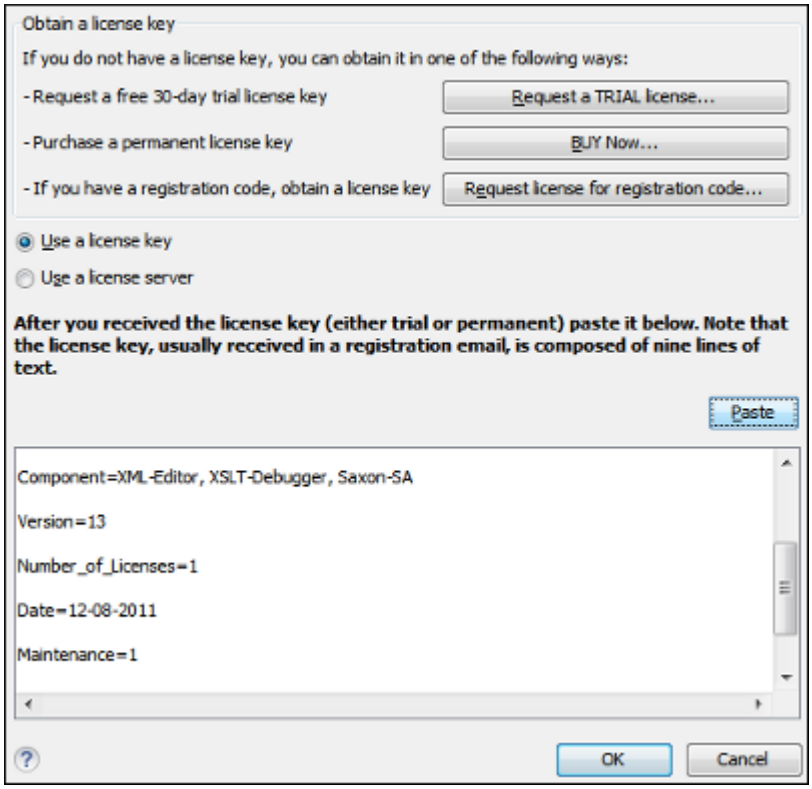
A **Subscription** license that allows you to use the application for a specific period of time (either 6 months or 1 year). This type of license is user-based and is covered by a Support and Maintenance Pack, which means that during the subscription period you will get free upgrades to all major and minor releases and priority technical support.

Registering a Subscription License

To register a *Subscription License*, follow these steps:

1. Purchase a license from the Oxygen XML Editor website. You will receive an email that contains your license key.
2. Save a backup copy of your email message that contains the new license key.
3. Start Oxygen XML Editor.
   If this is a new installation of Oxygen XML Editor, the registration dialog box is displayed. If the registration dialog box is not displayed, go to **Help > Register**.

Figure 12. License Registration Dialog Box



4. Select **Use a license key** as the licensing method.

> **Note:**
> If your license key has 20 or more licenses, you must use a license server *(on page 104)* instead.

5. Paste your license key into the registration dialog box. The license key is composed of nine lines of text between two text markers.
6. Click **OK**.

Related information

Oxygen XML Editor End-User License Agreement

Automatic Subscription Renewal

The **Oxygen License Server** has a mechanism that tries to detect when you purchase a renewal of your current subscription and automatically updates the license key.

To determine that a license key you purchased is a renewal of the license key you have currently installed in the License Server, it uses the **Previous order reference number** if you inserted it in the checkout process.

This automatic renewal mechanism makes an HTTP request to *https://oxygenxml.com/subscription_management/check_renewal.php* and passes the following as parameters:

- The SGN field of the existing license key.
- The server signature that uniquely identifies the License Server installation.

This request is made by the License Server automatically (or manually by pressing the **Check now** link).

This mechanism can be disabled by deselecting the **Automatically check for subscription renewal** checkbox.

Floating Licenses

The floating license type is commonly used by organizations that have a large number of infrequent users who do not require simultaneous access to the application. Instead of each user having their own individual license key, a pool of licenses is available for use on demand, one at a time.

To use floating licenses, a license server is required and the license key needs to be activated. Your system administrator will most likely be responsible for setting up the license server *(on page 112)*. Then you will need to request a floating license from the server *(on page 109)*. This process is designed to ensure compliance with the *Oxygen End-User License Agreement (EULA)*. This means that the license key will be locked to a particular license server deployment, and the same license key cannot be used with any other license server.

For information about releasing and returning a floating license to the pool for other users, see Releasing a Floating License *(on page 110)*.

For information about reserving (or locking) a floating license so that it does not get returned to the pool, see Reserving a Floating License *(on page 111)*.

Requesting a Floating License from a License Server

How to Request a Floating License

To request a floating license from an HTTP license server, follow this procedure:

1. Contact your server administrator to make sure the license server has already been set up and get network address and login details for the license server.
2. Start Oxygen XML Editor.
3. Go to **Help > Register**.

   Step Result: The license registration dialog box is displayed.
4. Choose **Use a license server** as licensing method.
5. Select **HTTP/HTTPS Server** as server type.

6. In the *URL* field, enter the address of the license server. The URL address has the following format: `http://hostName:port/oXygenLicenseServlet/license-servlet`.
7. Complete the *User* and *Password* fields.
8. Click the **OK** button.

Result: If a floating license is available, it is registered in Oxygen XML Editor. To display the license details, open the **About** dialog box from the **Help** menu. If a floating license is not available, you will get a message listing the users currently using floating licenses.

How to Register Floating Licenses for Multiple Users

If you are an administrator and you want to register floating licenses for multiple users without having to open Oxygen XML Editor on each machine to manually configure the registration details one by one, you can use the following procedure:

1. Reset the registration details in Oxygen XML Editor:
   a. Go to **Help > Register**.
   b. Click **OK** without entering any information in this dialog box.
   c. Click **Reset** and restart the application.
2. Register the license using one of the floating license registration procedures *(on page 109)*.

   Step Result: A `license.xml` file is created.
3. Copy the `license.xml` file from the `preferences` directory *(on page 132)* and place it in the installation folder on each machine to be registered.

Related information
Installing License Servers *(on page 112)*

Releasing a Floating License

The floating license you are using will be released and returned to the pool if any of the following occur:

- The connection with the license server is lost.
- You exit the application running on your machine, and no other copies of Oxygen XML Editor running on your machine are using your floating license.
- You register a *Named User* license with your copy of Oxygen XML Editor, and no other copies of Oxygen XML Editor running on your machine are using your floating license.
- Your computer idles for more than 2 hours.
- Your system administrator manually revokes the license *(on page 118)*.

Tip:
To prevent your floating license from being released, you can use the **Lock floating license** action available in the **Help** menu. You can use the same action to unlock the license. Note that your system administrator can also unlock your license *(on page 118)*.

To release a floating license on demand, follow these steps:

1. Go to **Help > Register**.
   The license registration dialog box is displayed.
2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.
3. Make sure the **Use a license key** option is selected.
4. Click **OK**.
   A dialog box is displayed asking if you want to reset your license key.
5. Select between:
   - **Use the last one** - Falls back to your previous license key. Use this option if you want to release a floating license and revert to a *Named User* license.
   - **Reset** - Removes your license key from your user account on the current computer.

   The **Reset** button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Editor.

Reserving a Floating License

There may be times when you need to reserve or lock a floating license. For example, you could lock a floating license if you want to use your floating license offline while traveling.

To reserve/lock a floating license, follow these steps:

1. **Important:** The license server must be configured by the server administrator to allow license locking. See License Server Management and Statistics - Configuration *(on page 118)*.
2. Select **Lock floating license** from the **Help** menu.
3. Click **OK**.
   Your floating license is now locked. You can use the same action to unlock the license or you can contact your system administrator to unlock it.

   Note:

   A locked floating license uses one license from the license pool for the entire period it remains locked.

Registering Floating Licenses for Multiple Users

If you are an administrator and you want to register floating licenses for multiple users without having to open Oxygen XML Editor on each machine to manually configure the registration details one by one, you can use the following procedure:

1. Reset the registration details in Oxygen XML Editor:
    a. Go to **Help > Register**.
    b. Click **OK** without entering any information in this dialog box.
    c. Click **Reset** and restart the application.
2. Register the license using one of the floating license registration procedures *(on page 109)*.

    Step Result: A `license.xml` file is created.
3. Copy the `license.xml` file from the `preferences` directory *(on page 132)* and place it in the installation folder on each machine to be registered.

Related information
Requesting a Floating License from a License Server *(on page 109)*
Installing License Servers *(on page 112)*

Installing License Servers

If you are using floating licenses or a large number of user-based licenses (20 or more) for **Oxygen XML Editor/Author/Developer**, you must set up an **Oxygen License Server**.

The HTTP License Server is available in several distributions, tailored for covering various deployment configurations:

- **Windows installer** - Easy-to-use Windows installation wizard. Requires elevated permissions to run it.
- **All-platform distribution** - Script-based deployment that does not require elevated permissions to run it. Provides scripts for Windows, macOS, and Linux.
- **Web Archive (WAR) distribution** - Provides more flexibility in your deployment configuration, but it requires an existing HTTP server (such as Apache Tomcat).

HTTP License Server System Requirements

Table 2. Minimum Requirements

Hardware	Specification
CPU	1 core
RAM	512 MB/Linux OS, 1 GB/Windows OS (256 MB available memory)
Hard Disk Space	500 MB

Table 2. Minimum Requirements (continued)

Hardware	Specification
Network Requirements	**Network interfaces stay unchanged (static MAC addresses) after activation**
Server OS Requirements	• Linux • Windows (Server 2022 is supported)
Antivirus and Firewall Requirements	Allow access to the configured TCP port (default 8080)

Note:
Oxygen XML Editor/Author/Developer version 17 or higher requires a license server version 17 or higher. License servers version 20.1 or higher can be used with any version of a floating or named-user license key.

Restriction:
The floating license server does not work with *Docker* containers.

Manual License Activation Procedure

If you cannot access the License Server administration page from a browser that has internet access (therefore, the license cannot be activated automatically during the installation), you can manually activate the license by following these steps:

1. Access the HTTP license server management page in a web browser.
2. Copy the machine signature code.

   Note:
   The machine signature is displayed on the page as long as the license key has not yet been activated. If you are trying to update/replace an already activated license key, the machine signature can be found by clicking on **Remove/Replace License**, then selecting **Replace** on the next page.

3. Go to the activation page at: http://www.oxygenxml.com/activation/.
4. Enter or paste the machine signature code and the license key, then click **Activate**.

   Step Result: The activated license key is displayed on-screen.
5. Copy the activated license key and paste it in the license registration page of the HTTP server.

Preconfiguring License Server Details When Installing Oxygen XML Editor

It is possible to install Oxygen XML Editor with the license server details preconfigured. For more information, see:

- **Windows:** Windows Installation: Command-Line Parameters for Preconfiguring License Server Details *(on page 91)*.
- **Linux:** Linux Installation: Command-Line Parameters for Preconfiguring License Server Details *(on page 98)*.

Backup License Server Information

If you want to use a backup license server, the setup instructions are the same as the procedures for a main license server, but it requires its own separate license key. Contact the Oxygen support team to find out more details about the backup license pricing and availability.

Related information

Troubleshooting: Server Signature Mismatch Errors *(on page 123)*

Installing the License Server Distribution for Windows

1. Download the HTTP license server installer from the HTTP License Server website.
2. Run the installer and follow the on-screen instructions.
3. You must configure two sets of credentials:
    a. **Administrator credentials** - Used for accessing the **Oxygen** license server administrative interface.
    b. **Standard user credentials** - Used by an **Oxygen** application to connect to the license server.
4. You can choose to change the default 8080 port the server runs on. If you need to change the port after the installation, you can edit the following *vmoptions* file: `oXygen HTTP License Server\Windows Service\oXygenHTTPLicenseServer.vmoptions`.
5. Optionally, you can choose to install the server as a Windows service. In this case, you can choose the name of the Windows service.

Tip:
In case you run into issues, the license server log file is located in: `[Installation_Directory]\work\logs\oXygenLicenseServlet.log`.

Installing the License Server All-Platform Distribution

1. **[Prerequisite]** Java 11 or later must be installed.
2. Download the HTTP license server all-platform archive from the HTTP License Server website.
3. Unpack the archive.

4. Run the license server scripts suitable for your operating system (`licenseServer.bat` for Windows or `licenseServer.sh` for Linux and macOS).

   Note:
   To specify a port other than the default 8080, you can pass a new port number as an argument to the scripts (for example, `licenseServer.bat 8082`). You can also change the port by editing the *vmoptions* file located at `oXygen HTTP License Server\Windows Service \oXygenHTTPLicenseServer.vmoptions`.

5. On the first run, you are prompted to set two sets of credentials:
   a. **Administrator credentials** - Used for accessing the **Oxygen** license server administrative interface.
   b. **Standard user credentials** - Used by an **Oxygen** application to connect to the license server.

      Tip:
      If you want to manually install, start, stop, or uninstall the server as a Windows service, run the following scripts from a command line as an Administrator:
      - `installWindowsService.bat [serviceName]` - Installs the server as a Windows service with the name *serviceName*. The parameters for the license key folder and the server port can be set in the `oXygenLicenseServer.vmoptions` file.
      - `startWindowsService.bat [serviceName]` - Starts the Windows service.
      - `stopWindowsService.bat [serviceName]` - Stops the Windows service.
      - `uninstallWindowsService.bat [serviceName]` - Uninstalls the Windows service.

      If you do not provide the `serviceName` argument, the default name *oXygenLicenseServer* is used.

      If the license server is installed as a Windows service, the error messages are redirected to the `errLicenseServer.log` file in `oXygen HTTP License Server\work \Windows Service` folder.

Installing the License Server WAR Distribution

1. Make sure that you have Java Servlet Container installed on the server you have selected to be the license server. Apache Tomcat 5.5 through 9.x is recommended (available at http://tomcat.apache.org). Tomcat 9.x is officially supported.

   Note:
   Tomcat 10.x and later will not work with the license server.

Important:
By default, the license server stores the statistics database and other data in the Java Servlet Container's temporary directory. If you are not using Apache Tomcat, this directory may be deleted when the server is stopped or restarted. However, you can set the `oxygen.license.server.work.dir` system property to specify a different path for the directory where the database is stored.

2. Download the HTTP license server **Web Archive** (**.war**) from the HTTP License Server website.

3. Configure three user roles in your installation of the Java Servlet Container (such as Apache Tomcat):
   a. One user with the role *user*, used by an **Oxygen** application to connect to the license server. In the subsequent example, this user name is **John**.
   b. Another user with the role *admin*, used for accessing the HTTP License Server administrative interface and the management interface. In the subsequent example, this user name is **Mary**.

   For example, in Apache Tomcat, a typical way to achieve this is to edit the `tomcat-users.xml` file from your Tomcat installation (if using a Tomcat **zip**/**tar.gz** distribution, by default this configuration file is found in the `/TomcatInstallFolder/conf/` directory). After adding the three users, the configuration file might look like this:

```
<tomcat-users xmlns="http://tomcat.apache.org/xml"
              xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
              xsi:schemaLocation="http://tomcat.apache.org/xml tomcat-users.xsd"
              version="1.0">
  <!-- ... other user and role definitions ... -->
  <role rolename="user"/>
  <role rolename="admin"/>
  <user username="John" password="user_pass" roles="user"/>
  <user username="Mary" password="admin_pass" roles="admin"/>
</tomcat-users>
```

4. Deploy the WAR file.

   For example, in Apache Tomcat, go to the Web Application Manager page and log in with the user you configured with the *admin* role (*Mary* in the example above). In the **WAR file to deploy** section, choose the WAR file and click the **Deploy** button. The `oXygenLicenseServlet` application is now up and running, but the license key is not yet registered.

5. Go to the HTTP License Server administration page. By default, the address of this page is `http://<server-address>/oXygenLicenseServlet`. In Apache Tomcat, you can also open this page by clicking the `oXygenLicenseServlet` link in the manager page.

   You need to authenticate with the user configured with the `admin` role (*Mary* in the example above).

6. **Activate the license key**. This process involves binding your license key to your license server deployment. The browser used in the activation process needs to have Internet access.

   > **Note:**
   > If you cannot access the internet during the deployment, you can manually activate the license key.

   Once the process is completed you cannot activate the license on another license server. Follow these steps to activate the license:

   a. Paste your license key into the form and click **Register/Activate**.

      Step Result: You will be redirected to an online form hosted on the **Oxygen** website. This form is pre-filled with an activation code that uniquely identifies your license server deployment, and your license key.

   b. Click **Register/Activate**.

      If the activation process is successfully completed, your license server is running. Follow the on-screen instructions to configure the Oxygen XML Editor client applications.

7. The application's log file location is specified by the `log4j.appender.R2.File` property from the `WEB-INF/lib/log4j.properties` configuration file.

   For example, in Apache Tomcat, the configuration file is located at: `TomcatInstallDir/webapps/oXygenLicenseServlet/WEB-INF/lib/log4j.properties` and the default log file location is `TomcatInstallDir/logs/oxygenLicenseServlet.log`.

Installing Multiple Instances of WAR Distribution on a Tomcat Web Server

For organizations that have multiple sets of licenses (for example, an integrator with multiple clients might host a different license server for each client), use this procedure to install multiple instances of the *Oxygen License Servlet* on a Tomcat web server:

1. Rename the license server WAR file according to your needs. For example, you could use the customer name and a number (e.g. *client23415*).
2. Go to your Tomcat license server manager (e.g. `http://my.tomcatserver.com:port/manager/`) and enter your credentials.
3. Scroll to **WAR file to deploy** and press **Browse** button.
4. Locate the WAR file from step 1 and press the **Open** button.
5. Press the **Deploy** button.
6. Check that the newly deployed license server is running (it must be in the **Applications** table).

Managing License Servers

This section includes information about managing the your license server.

License Server Management and Statistics Pages

A system administrator can manage and access information about the license server at: `http://hostName:port/oXygenLicenseServlet`.

This page provides access to several statistics reports and management tasks. It also displays the current status of the server and provides additional instructions for using the license server with **Oxygen XML Editor/Author/Developer**.

This page includes the following links for accessing statistics or managing tasks:

- **Current Allocated Licenses** - Opens the **Allocated License Report** page *(on page 118)*.
- **Usage Statistics** (Available only for floating licenses) - Opens the **License Usage Statistics** page *(on page 119)*.
- **View License Key** - Use this link to open a page where you can see details about the license key.
- **Replace/Remove License Key** - Use this link if you need to replace or remove the current license key *(on page 121)*.
- **Configuration** - Opens a page where you can configure notification settings and set up the mail server used for sending emails whenever license requests from users are rejected. This page also contains a **Allow users to lock licenses** option. Enabling this option allows the users to lock/reserve a floating license *(on page 111)*.
- **Users management** (Available only for named-user licenses) - Opens a page where you can manage the list of users who are entitled to use the license key.
- **Allowed users list** (Available only for named-user licenses) - Opens a page where you can see the allowed users list (if one has already been configured), along with instructions for configuring one.

Allocated License Report Page

This report page provides a system administrator the ability to revoke or unlock current running instances of licenses and includes the following information:

- **License load** - A graphical indicator that shows how many licenses are available.
- **License server status** - General information about the license server status, such as start time, license counts, rejected and acknowledged requests, average usage time, license refresh and timeout intervals, location of the license key, and the server version.
- **Current running instances** - Lists all currently acknowledged users, including user name, date and time when the license was granted, IP and MAC address of the computer where **Oxygen** runs, and lock status.
    - **Revoke** - A system administrator can click on the ✕ **Revoke** icon next to a user name to release that particular license and return it to the pool.
    - **Unlock** - If a user has locked their license, the system administrator can also unlock it from this page.

Note:
This report is also available in XML format at: `http://hostName:port/oXygenLicenseServlet/license-servlet/report-xml`.

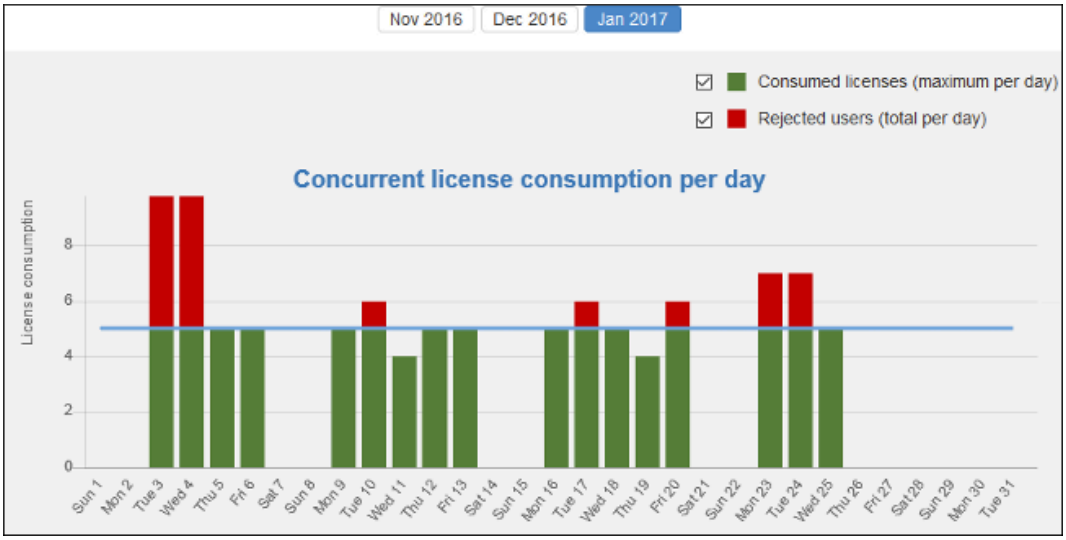
License Usage Statistics Page (Floating License Only)

This report page provides some usage statistics for the floating licenses. It is helpful for determining the number of licenses that are needed and monitoring times when licenses are consumed. It includes the following information:

- **Maximum number of concurrent licenses** - Shows the maximum number of floating licenses that can be consumed at any given time.
- **Concurrent license consumption per day** - A chart that shows the peak number of licenses that were consumed and the total number of users that were rejected, on a daily basis. This chart can be used to detect the amount of concurrent licenses that are needed to avoid having rejected users.

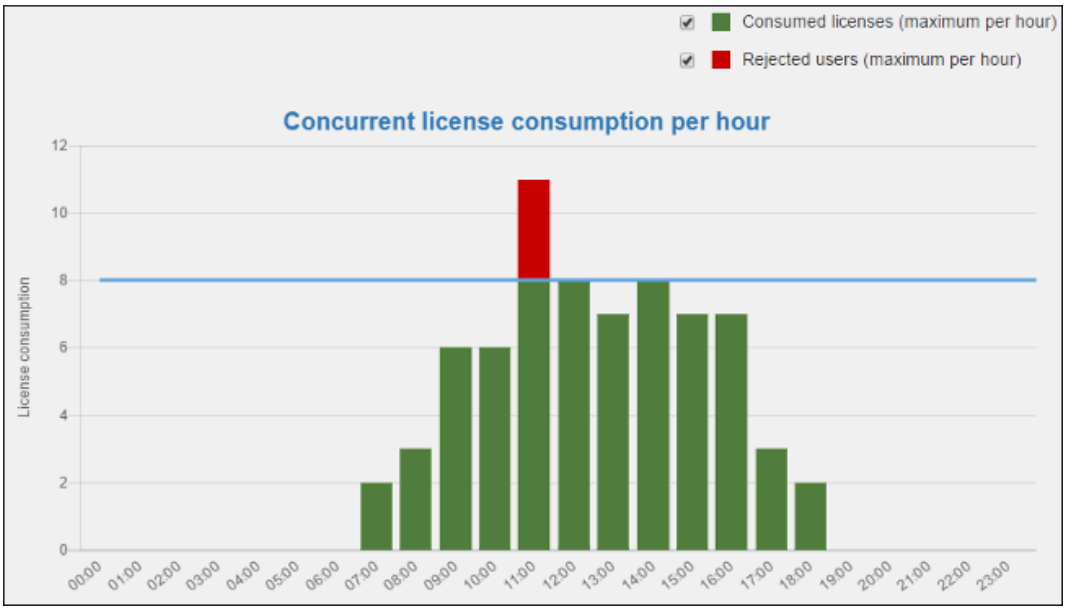
Tip:
You can click on any bar to see the license consumption per hour for that particular day.

Figure 13. Concurrent License Consumption per Day Chart



- **Concurrent license consumption per hour** - A chart that shows the peak number of licenses that were consumed per hour throughout that particular month. This is useful for identifying the time of day when the most licenses were consumed.

Figure 14. Concurrent License Consumption per Hour Chart



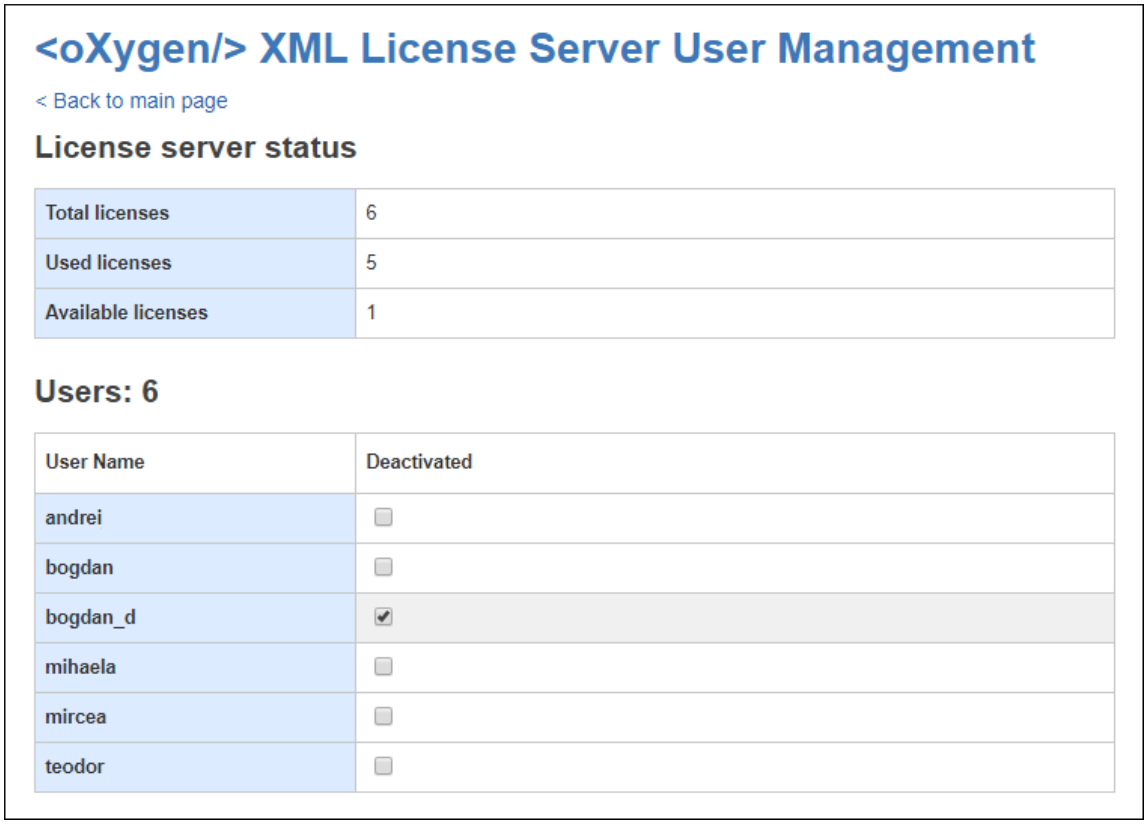
Users Management Page (Named-User License Only)

When a named-user license key is used, the license server allocates available licenses in the order they are requested until the maximum number is reached. Any additional users attempting to obtain a license key will be rejected.

This page provides access to the list of registered users and allows the server admin to:

- Revoke a user's right to use a license.
- Reactivate a previously deactivated user.

Figure 15. Users List Management Page



Replacing or Removing a License Key in an HTTP License Server

The following procedure assumes that your HTTP license server contains a previously activated license key and provides instructions for replacing it with another one or removing it completely.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key that accommodates a different number of users *(on page 105)*.

Replacing a License Key

To replace a license key that is activated on your HTTP license server with a new one, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page and log in using your **admin** credentials.
2. Click the **Replace/Remove license key** link. This will open a page that contains details about the license currently in use.
3. Click the **Replace** button.
4. Paste the new license key in the displayed form.
5. Click **Register/Activate**. The browser used in the process needs to have Internet access.

Step Result: You will be redirected to an online form hosted on the **Oxygen** website. This form is pre-filled with an activation code that uniquely identifies your license server deployment and your license key.

> **Note:**
> If you cannot access the online activation form, you can manually activate the license key *(on page 113)*.

Result: If the activation process is completed successfully, your license server is now running using the new license key. You can click **View license key** to inspect the key currently used by the license server.

Removing a License Key

To remove a license key that is activated on your HTTP license server, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page and log in using your **admin** credentials.
2. Click the **Replace/Remove license key** link. This will open a page that contains details about the license currently in use.
3. Click the **Remove** button to begin the license deletion procedure.
4. Click the **Remove** button in the confirmation page.

> **Important:**
> The removal process is irreversible. Once the process is complete, you cannot restore the license key.

Upgrading Your HTTP License Server

The goal of the following procedure is to help you minimize the downtime when you upgrade the HTTP License Server to its latest version:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the **admin** credentials.
2. Click the **View license key** link and copy the displayed license key to a file for later use.
3. Go to the Tomcat Web Application Manager page, log in with the user you configured with the **admin** role, and *Undeploy* the license server.
4. Download the Web Archive (WAR) distribution of HTTP license server.
5. Deploy the downloaded license server.
6. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the **admin** user.
7. Paste your license key into the form and register it.

Configuring a License Server to Only Allow Certain Users

A system administrator can configure the license server to only allow specific users to request a license. This is available only for named-user licenses (not floating licenses) and is managed using an *Allowed Users List*.

To configure an *Allowed Users List*:

1. Create a text file named **allowed-users.txt**.
2. Enter the user name for each allowed user on a separate line.
3. Save the file in the license server work directory. You can go to the license server management page, and under *Management Tasks*, click the **Allowed users list** link to open a page where you can see the exact directory where it needs to be stored.

> **Note:**
> If the `allowed-users.txt` file is present but it is empty, all users are allowed to request a license.

In the license server management page, there is a link to the **Allowed users list** under *Management Tasks*. Also, in the **Current Allocated Licenses** page, there is a **Show allowed users** button. Both of them direct you to a page where you can see the *Allowed Users List* (if one has already been configured), along with instructions for configuring one. The list updates automatically between license requests every 30 seconds if the file is changed.

Common Problems: License Server Errors

This section includes some common problems that may appear when setting up a license server.

Server Signature Mismatch Error

Problem

I receive an error indicating that *the current license was already activated on a License Server* or that the *License Server's Signature does not match*.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called *Server Signature*) is sent to the **Oxygen** servers, which in turn will sign the license key. The *Server Signature* is computed from the list of network interfaces of the server where you deployed the license.

When starting the license server, if you receive an error stating that your *Server Signature* does not match, there are several possible causes:

Possible Cause 1

The license key was moved to a new server that hosts your license server.

Solution

Revert to your previous configuration.

Possible Cause 2

A new network interface was changed, added, or activated in the server that hosts your license server.

Note:
A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

Solution

If reverting is not possible, contact the Oxygen support team.

Possible Cause 3

The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (`/usr/local/apache-tomcat-V.V.V`) with a symbolic link to the typical folder (`/usr/local/tomcat`). The server can be restarted from either location, but it is recommended to always restart from the typical folder (`/usr/local/tomcat`) and always restart from the same location.

Solution

The server simply needs to always be restarted from the same location.

Upgrading

From time to time, upgrades and patch versions of Oxygen XML Editor are released to provide enhancements that fix problems and add new features.

By default, Oxygen XML Editor automatically checks for new versions at startup (or every 24 hours from startup). If a newer version is detected, a dialog box will automatically be displayed that provides information about the type of upgrade or update that is available. If a new patch of a new version is detected, the dialog box will be displayed only when the new patch version includes a critical bug fix or when the license allows upgrading to the new version.

To disable this check, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Global**, and deselect **Automatic Version Checking**.

To check for new versions manually, go to **Help > Check for New Versions**. This opens a dialog box that displays information about whether or not a newer version is available.

Upgrading Oxygen XML Editor on Windows/Linux

What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Editor, some data is preserved and some is overwritten. If there is a previous version of Oxygen XML Editor already installed on your computer, it can coexist with the new one, which means you do not have to uninstall it.

If you install over a previously installed version:

- All the files from its install directory will be removed, including any modification in *framework (on page 3420)* files, XSLT stylesheets, *XML Catalogs (on page 3425)*, and templates.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom *frameworks (on page 3420)* that were stored outside the installation directory (as configured in **Document type associations > Locations** *(on page 147)*) will be preserved and will be found by the new installation.

If you install in a new directory:

- All the files from the old install directory will be preserved, including any modification in *framework (on page 3420)* files, XSLT stylesheets, *XML Catalogs (on page 3425)*, and templates. However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom *frameworks (on page 3420)* that were stored outside the installation directory (as configured in **Document type associations > Locations** *(on page 147)*) will be preserved and will be found by the new installation.

How to Upgrade Oxygen XML Editor on Windows or Linux

1. Upgrading to a new version might require a new license key. To check if your license key is compatible with the new version, select **Help > Check for New Version**. Note that the application needs an Internet connection to check the license compatibility.
2. Download and install the new version according to the instructions for your platform and the type of installer you selected.
3. If you installed from an archive (as opposed to an executable installer) you may have to update any shortcuts you have created or modify the system PATH to point to the new installation folder.
4. Restart Oxygen XML Editor.
5. If you require a new license for your upgrade, install it now according to the procedure for your platform and the type of installer you selected.

Upgrading Oxygen XML Editor on macOS

What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Editor, first you need to remove or rename the old installation directory. By renaming the directory, it can coexist with the new installation and the following data will be preserved:

- All the files from the old install directory will be preserved, including any modification in *framework (on page 3420)* files, XSLT stylesheets, *XML Catalogs (on page 3425)*, and templates. However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom *frameworks (on page 3420)* that were stored outside the installation directory (as configured in **Document type associations > Locations** *(on page 147)*) will be preserved and will be found by the new installation.

How to Upgrade Oxygen XML Editor on macOS

1. Uninstall the current version of Oxygen XML Editor *(on page 130)* or rename the installation directory.
2. Upgrading to a new version might require a new license key. To check if your license key is compatible with the new version, select **Help > Check for New Version**. Note that the application needs an Internet connection to check the license compatibility.
3. Download and install the new version in an empty folder according to the instructions for your platform and the type of installer you selected.
4. If you installed from an archive (as opposed to an executable installer) you may have to update any shortcuts you have created or modify the system PATH to point to the new installation folder.
5. Restart Oxygen XML Editor.
6. If you require a new license for your upgrade, install it now according to the procedure for your platform and the type of installer you selected.

Installing and Updating Add-ons

Oxygen XML Editor provides an *add-on (on page 3422)* mechanism that can automatically discover and install *frameworks (on page 2407)* and *plugins (on page 2565)* from a remote location.

Note:
Frameworks that you install through the add-ons system are read-only.

Installing Add-ons

To install an add-on that is hosted on a remote update site, follow these steps:

1. Go to **Help > Install new add-ons**.
2. In the displayed dialog box, enter or paste the update site that hosts the add-on in the **Show add-ons from** field (or select it from the drop-down menu, if applicable). The default add-ons are hosted on **https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml**. If you want to see a list of all the default and sample add-ons that are available on the *Oxygen* remote update sites, choose **ALL AVAILABLE SITES** from the drop-down menu. The add-ons list contains the name, status, update version, Oxygen XML Editor version, and the type of the add-on (either **framework**, or **plugin**). A short description of each add-on is presented under the add-ons list.

   Note:
   To see all the versions of the add-ons, deselect **Show only compatible add-ons** and **Show only the latest version of the add-ons**. Incompatible add-ons are shown only to acknowledge their presence on the remote update site, but you cannot install an incompatible add-on.

3. Choose the add-ons you want to install, click the **Next** button, then follow the on-screen instructions.

   Note:
   Accepting the license agreement of the add-on is a mandatory step in the installation process.

   Note:
   All add-ons are installed in the `extensions` directory inside the Oxygen XML Editor preferences directory *(on page 132)*.

Tip:
As an alternate approach, you can add an **Install** button to a web page that links to a URL that has the syntax `https://host/path/to/updateSite.xml?oxygenAddonId=addOnIDValue` and drop the button into the application's main editing area.

Managing Installed Add-ons

To manage the installed add-ons, follow these steps:

1. Go to **Help > Manage add-ons**
2. The displayed dialog box presents a list of your installed add-ons along with various information (such as the installed version, the compatible *Oxygen* version, and more). The **Status** column will indicate if an update is available for a particular add-on. Also, you can click on the row for any particular add-on that has an update available to see details for the update (displayed in the preview pane below the list of add-ons).
3. To update an add-on, select the checkbox for the specific add-on, then click **Update** to update it (or **Uninstall** to remove it). If there is a newer version of the add-on available, Oxygen XML Editor will

download the package and install it. Follow the on-screen instructions to complete the installation process.

> **Note:**
> Accepting the license agreement of the add-on is a mandatory step in the installation process.

Checking for Add-on Updates

To check if there are available updates for the installed add-ons, go to **Help > Check for add-ons updates**. This action displays updates that are compatible with the current Oxygen XML Editor version.

Preserving Installed Add-ons After Upgrading Oxygen to a New Version

After installing or upgrading to a new version of Oxygen XML Editor, when you re-start the application, a dialog box will be displayed where you can decide which previously installed versions of add-ons should be imported and used for the new version of the product.

After you make the decision to import previous add-ons to the new application version, add-ons installed for previous versions remain present in the application settings folder and can still be used with those older application versions. The application may advise you to cleanup your previously installed add-on by displaying a dialog box where you can decide which previously installed versions of add-ons should be preserved or removed. To remove all add-ons for a particular application version (to free up disk space), select it in the main pane of the dialog box and click the **Remove add-ons** button.

Related information

Packing and Deploying Plugins as Add-ons *(on page 2565)*

Privacy Options

As an on-premise desktop application, Oxygen XML Editor does not store sensitive user data or user-specific files on remote servers. The full Privacy Policy is available on the official Oxygen XML Editor web site.

Whenever it is started, the application may connect to its official web site (**https://www.oxygenxml.com**) to provide notifications about new releases or new events. In the **Global** preferences page, there are some checkboxes that can be disabled if you do not want this type of information retrieved:

Automatic Version Checking

If this option is selected, the application obtains information about new available versions from the official Oxygen XML Editor web site. No specific information about the current installation is passed to the Oxygen XML Editor web site during this process.

Check for Oxygen-related events at startup

If this option is selected, the application obtains information about events that get displayed in the **Welcome** screen. The types of downloaded events include information about the addition of new videos on the website, announcements of upcoming webinars and conferences where the

Oxygen XML Editor team will participate, and more. No specific information about the current installation is passed to the Oxygen XML Editor web site during this process.

Check for Oxygen-related notifications

If this option is selected, the application obtains information about other various notifications that get displayed on the right side of the status bar *(on page 368)*. No specific information about the current installation is passed to the Oxygen XML Editor web site during this process.

Providing installation-specific details to the Oxygen XML Editor technical support team is also possible by using the **Help > Report problem** action from the main menu. Also, if an *unhandled/fatal* error occurs in the application, the user is presented with a **Report problem** dialog box and can choose to submit the error and its context for analysis. The **Report problem** dialog box shows the exact specific details that are sent to the Oxygen XML Editor technical support team and can be examined by the end user before being sent. No files or confidential information are sent.

When the application is installed on Windows or Linux using the provided installation kit, the last installation step allows you to click a **Privacy Options** link to choose which privacy-related settings should be disabled before the application starts for the first time. The **Privacy Options** can also be disabled when performing an unattended install. See instructions here: Windows Unattended Installation *(on page 90)*.

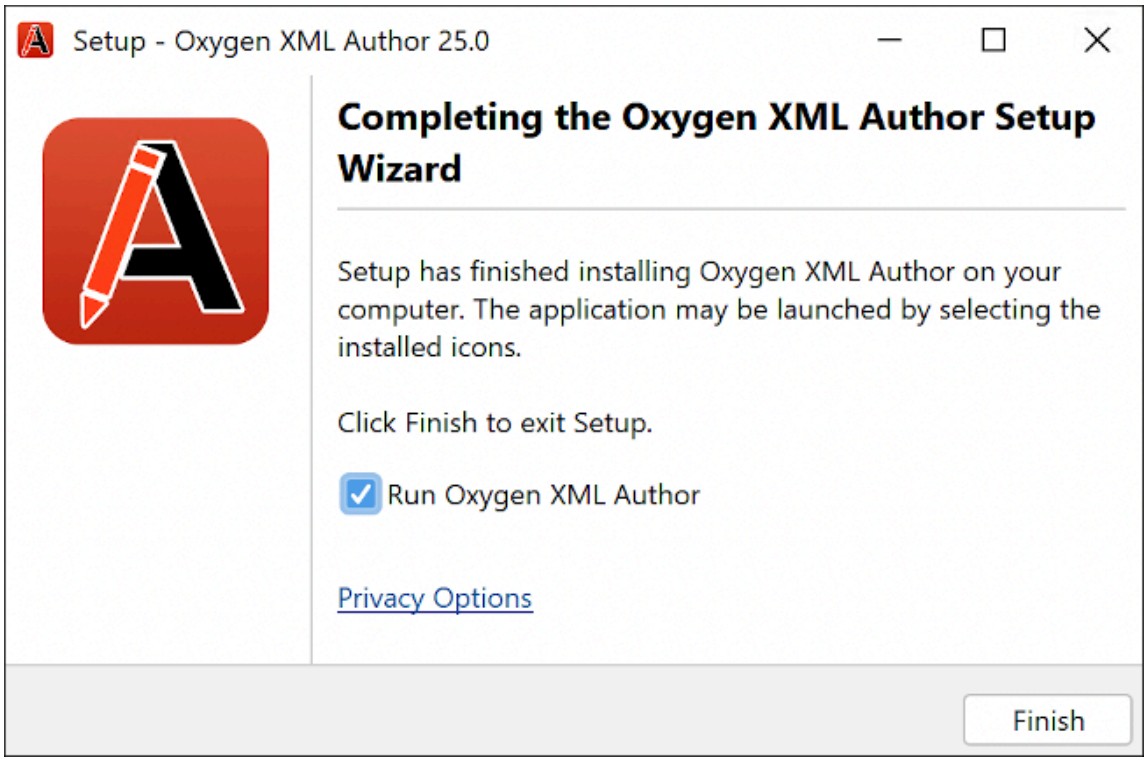

Figure 17. Installation -Privacy Options

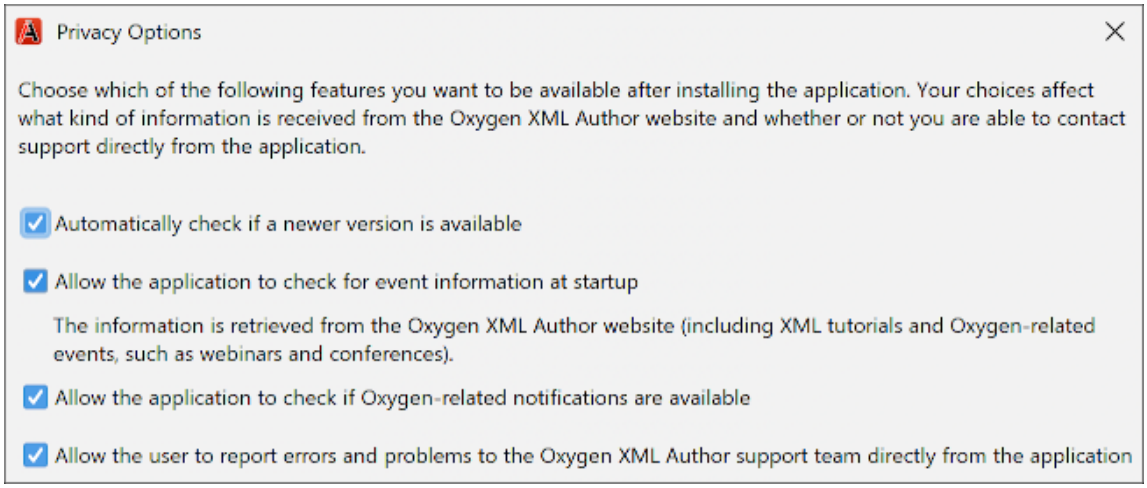


Uninstalling

How to Uninstall Oxygen XML Editor

CAUTION:
The following procedure will remove Oxygen XML Editor from your system. **All data stored in the installation directory will be removed, including any customizations or any other data you have stored within that directory. Make a backup of any data you want to keep before proceeding.**

1. Back up any data you want to keep from the Oxygen XML Editor installation folder.
2. Remove the application according to your operating system:
   - **Windows or Linux** - Use the appropriate uninstaller shortcut provided with your OS.
   - **macOS** - Manually delete the installation folder and all its contents.
3. If you want to remove the user preferences:
   - **Windows** - Remove the directory: `%APPDATA%\com.oxygenxml`. Note that the `AppData` directory is hidden. If you cannot locate it, type `%APPDATA%` and press `ENTER` in the File Explorer address bar. (`%APPDATA%` expands to `[user-home-dir]\AppData\Roaming`).
   - **macOS** - Remove the directory: `Library/Preferences/com.oxygenxml` of the user home folder.
   - **On Linux**, remove the directory: `.com.oxygenxml` from the user home directory.

Unattended Uninstall

The unattended uninstall procedure is available only on Windows and Linux.

Run the uninstaller executable from a command line with the **-q** parameter.

- **Windows** - The uninstaller executable is called `uninstall.exe` and is located in the *Oxygen* installation directory.
- **Linux** - The uninstaller executable is called `uninstall` and is located in the *Oxygen* installation directory.

4.

Configuring Oxygen XML Editor

This chapter presents all the user preferences and options that allow you to configure various features and aspects of the application itself. It also includes information about storing and sharing options, importing and exporting options or scenarios, customizing system properties, setting startup parameters, and the editor variables *(on page 332)* that are available for customizing user-defined commands.

Preferences

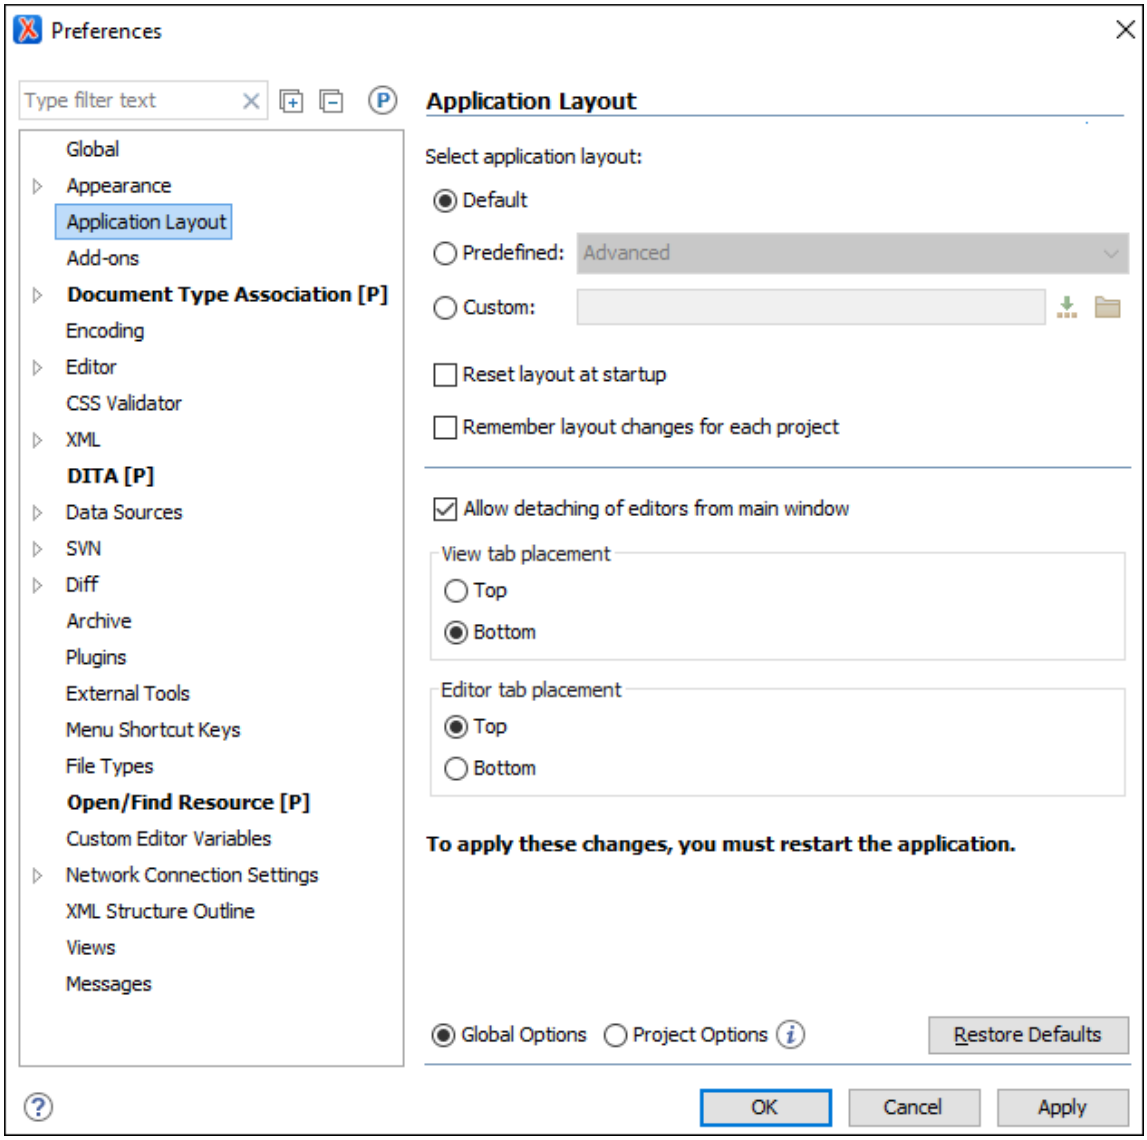
You can configure Oxygen XML Editor options using the **Preferences** dialog box.

To open the preferences dialog box, go to **Options > Preferences**.

You can select the preference page you are interested in from the tree on the left of the **Preferences** dialog box. You can filter the tree by using the filter text box and the following buttons are available to the right of the text box:

- **Expand All** - Expands the structure of the tree to show all preference pages.
- **Collapse All** - Collapses the structure of the tree to show only the 1st level preference pages.
- **Project-Level Options Only** - If toggled on, it filters the tree to only show the preference pages that are saved at project level *(on page 321)*.

Figure 18. Preferences Dialog Box



Click the ? icon or press **F1** for help on any preferences page.

Some preference pages include an option to control how the options are stored, either as **Global Options** *(on page 321)* or **Project Options** *(on page 321)*.

Figure 19. Controlling the Storage of the Preferences

You can restore options to their default values by pressing the **Restore Defaults** button, available in each preferences page.

Preferences Directory Location

A variety of resources (such as global options, license information, and history files) are stored in a preferences directory (`com.oxygenxml`) that is in the following locations:

- **Windows (7, 8, 10)** - `[user_home_directory]\AppData\Roaming\com.oxygenxml`
- **macOS** - `[user_home_directory]/Library/Preferences/com.oxygenxml`
- **Linux/Unix** - `[user_home_directory]/.com.oxygenxml`

Global Preferences

The global options cover various aspects of the overall operation of Oxygen XML Editor. To configure the **Global** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Global**.

The following options are available in the **Global** preferences page:

Automatic Version Checking

If this option is selected, Oxygen XML Editor will check for a new version on startup.

Check for Oxygen-related events at startup

If this option is selected, Oxygen XML Editor will check for various new event updates on the Oxygen XML Editor website and if any new events are found, they will be presented at startup.

Check for notifications

If selected (default value), the application will check for various types of messages from the Oxygen XML Editor website and they will be displayed in the status bar. The types of messages include the addition of new videos on the website, the announcement of upcoming webinars and conferences where the Oxygen XML Editor team will participate, and more.

Language

This option specifies the language used in the user interface. You can choose between English, French, German, Dutch, Japanese, or Chinese. You must restart Oxygen XML Editor for the change to take effect.

Other language

This option sets the language used in the user interface using an interface localization file. For details about creating this file, see Localizing the User Interface *(on page 347)*. You can use this option to set the language of the user interface to a language that is not shipped with Oxygen XML Editor.

Note:
If some interface labels are not rendered correctly after restarting the application, (for example, Korean characters are not displayed correctly), make sure that your operating system has the appropriate language pack installed (for example, the East-Asian language pack).

Line separator

This option specifies the type of line separator to be used when saving files. Use **System Default** to select the normal line separator for your OS. The other two possible selections are **Unix-like** and **Windows-like**.

Notes:

- This option is ignored if the **Detect the line separator on file open** option *(on page 134)* is selected AND a line separator is automatically detected.
- When changing the selection in this option, the change does not affect an opened file until you make a modification to the file and save it. At that point, all line separators in the file will change to the type of line separator you chose in this option.

Detect the line separator on file open

When this option is selected, the editor detects the line separator when a file is loaded and it uses it when the file is saved. If this option is not selected, you can use the **Line separator** option *(on page 133)* to choose the type of line separator to be used when saving files.

Tip:
To see the line separator type for the current file, you can use the **Properties** view (**Window > Show View > Properties**).

Default Internet browser

This option sets the Web browser that Oxygen XML Editor will use to do the following:

- Open (X)HTML or PDF transformation results.
- Open a web page.

If you leave this setting blank, the system default browser will be used.

Open last edited files from project

When this option is selected, Oxygen XML Editor opens the files you had open the last time you used a project whenever you open the application or switch to that project.

Load file content only when switching to its corresponding editor tab

When selected (default), files that were left open in the previous editing session remain as placeholder tabs but the file content is loaded only when switching to the corresponding editor tab. This helps to improve performance. If the option is deselected, the previously open files are all re-loaded at startup.

Check opened files for file system changes

When this option is selected, Oxygen XML Editor checks the content of the all open editors to see if they have been updated by another application. If the file has changed, Oxygen XML Editor will ask you if you want to reload the file.

Auto update unmodified editors on file system changes

If this option is selected, Oxygen XML Editor automatically updates unmodified editors if the edited file changes externally.

Beep on operation finished

When this option is selected, Oxygen XML Editor beeps when a validation or transform action ends. Different tones are used for success and failure. The tones used may depend on the sound settings in your operating system.

Show memory status

When this option is selected, the memory that Oxygen XML Editor uses is displayed in the status bar. To free memory, click the  **Free unused memory** button located at the right side of the status bar. The memory status bar turns yellow or red when Oxygen XML Editor uses too much memory. You can change the amount of memory available to Oxygen XML Editor by changing the parameters of the application launcher *(on page 349)*.

Order of switching between editor tabs

This option specifies the order for switching between open file tabs when using **Ctrl + Tab (Command + Tab on macOS)** or **Ctrl + Shift + Tab (Command + Shift + Tab on macOS)** *(on page 403)*. You can choose between:

- **Recently used order** - Switches to the most recently used tab.
- **Visual order** - Switches to the next tab in visual order.

File Chooser Dialog section

Use platform file chooser (Windows and macOS)

This option is selected by default and it specifies that the native file chooser is used. You can deselect this option if you want the Java Swing file chooser to be used instead. If Oxygen XML Editor encounters a problem while using the native file manager, it will avoid using it again in the current session, even if this option is selected.

Consider application bundles to be directories when browsing (macOS only)

This option is available only on the macOS platform. When selected, the file browser dialog box allows you to browse inside an application bundle, as in a regular folder. Otherwise, it is not allowed (the same as the Finder application on macOS).

Show hidden files and directories

If this option is selected, Oxygen XML Editor shows system hidden files and folders in the file browser dialog box and the folder browser dialog box.

Tip:
On macOS, you need to press **Command + Shift + Period** in the file browser to show hidden files.

File chooser opens

This option specifies the starting directory that the file browser dialog box *(on page 391)* will open. You can choose between:

- **Directory of the selected file** - The file browser opens the folder where the selected file is stored, depending on the current selection (for example, a file could be selected from the **Project** view, **DITA Maps Manager**, main editing pane, or another location within the application).
- **Last visited directory** - The file browser opens the last visited folder.

Appearance Preferences

This preferences page contains various options that allow you to change the appearance of the user interface of Oxygen XML Editor. To configure the **Appearance** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Appearance**.

The following options are available in the **Appearance** preferences page:

Look and Feel

This option allows you to change the graphic style (look and feel) of the user interface. Depending on the operating system, you can choose between various predefined style options.

Theme

This option allows you to choose predefined color themes that will be applied over the entire user interface. You can select between the following:

- **Light** (default theme in Windows)
- **Classic** (default theme in macOS)

Note:
In Windows, if a high contrast theme is detected and the **Theme** option is set to *Classic* and the **Look and Feel** option *(on page 136)* is set to *Default* or *Windows*, Oxygen XML Editor inherits the high contrast theme colors that are set in the operating system.

- **Graphite**

You can also change various appearance-related options in other preference pages for the selected theme by clicking on the various links in this section.

Custom Themes

You can also create custom themes to share with others or use in other installations of Oxygen XML Editor. To create a custom theme, follow these steps:

1. Select a **Theme** to use as a base.
2. Configure the desired options in any of the option pages listed in this preferences page.
3. Click **Export** and specify a name for your custom theme. If you save the theme to the default file path, your custom theme will immediately appear in the **Theme** drop-down list. Otherwise, if you save it to another location, you can use the **Import** button *(on page 137)* to make it appear in the drop-down list.

Note:
In macOS (starting with Yosemite), if you choose *Graphite* for the **Theme**, it is recommended that you select the **Use dark menu and Dock** option that is found in **System Preferences > General**.

Theme preview area

Displays a preview of the current **Theme** selection *(on page 136)* (available for predefined color themes).

Theme management section

Reset

Resets the theme to its default values (this option is available when the theme is modified).

Rename

Changes the name of the theme (not available for default or predefined themes).

Delete

Removes the selected theme (not available for default or predefined themes).

Import

Allows you to import a color theme from an XML theme file. You can use this option to load an exported custom theme *(on page 137)*.

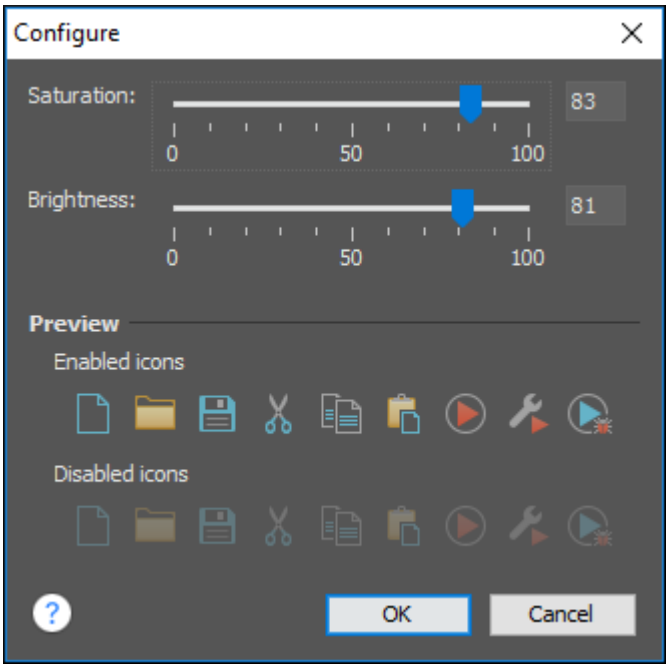
Export

Allows you to export the current color theme into an XML theme file that can then be shared with others or imported into another installation of Oxygen XML Editor.

Configure icon saturation and brightness link

This link is available if you are using the **Graphite** theme *(on page 136)*. It opens a dialog box where you can configure the saturation and brightness for all the icons in Oxygen XML Editor.

Figure 20. Configure Icon Saturation and Brightness Dialog Box



Colors Preferences

Oxygen XML Editor allows you to configure the colors for frames, dialog boxes, controls, and commands. To configure the **Colors**, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Appearance > Colors**.

Clicking the color button for any of the options opens a **Choose color** dialog box. It includes several tabs that allow you to configure the color in numerous ways. This page allows you to select and configure the color for the following:

Background Colors

Background

Background color for various general user interface items.

Components background

Background color for various components (such as text fields, views, tables, and dialog boxes).

Components selection background

Background color for the current selections in certain components, such as some views and panes.

Components inactive selection background

Background color for a selection in a view that is not the current focus.

Menus, toolbars and frame background

Background color for specific components such as menus, toolbars, and the application frame.

Menus and toolbars selection background

(This option is not available for macOS) Background color for menu selections and toolbar buttons.

View titles background

Background color for the titles of view and tabs.

Status bar background

Background color of the status bar at the bottom of the editor.

Foreground Colors

Foreground

Foreground color for various general user interface items.

Component selection foreground

Foreground color for the current selection.

Disabled foreground

Foreground color for various components that are not the current focus (such as views other than the currently selected one).

Link foreground

Foreground color for links in views and dialog boxes.

View titles foreground

Foreground color for the title bar of views.

Status bar foreground

Foreground color for the text in the status bar at the bottom of the editor.

Other Colors

Borders and table grids

Color for certain borders and table grid lines.

Text component border

Color for the borders of text fields and drop-down lists.

View/Editor tabs border

Color for the borders of views and tabs.

Scroll bars, chevrons

Color for scroll bars (navigation bars) and chevrons (button to expand a non-visible area).

Separator

Color for the separators in toolbars, menus, and dialog boxes.

Note:
You must restart the application for your changes to be applied.

Fonts Preferences

Oxygen XML Editor allows you to choose the fonts to be used in the **Text**, **Design**, and **Grid** editor modes, and fonts for the **Author** mode that are not specified in the associated CSS stylesheet. To configure the font options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Appearance > Fonts**.

The following options are available:

Editor

Specifies the font family, size, and weight to be used in the **Text** mode editor. To change the current values, double-click the text field or click the **Choose** button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the **Sample** box to see a preview of how it will look in the application. If you select the **Show only the fonts that can render the sample text** option and paste content in the **Sample** box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

Note:
On macOS, the default font, Monaco, cannot be rendered in bold.

Tip:
If you have recently installed fonts in Windows and they do not appear in the list of available fonts, you need to make sure you install the fonts via the **Install for all users** option instead of **Install for me**. For more details, see Fonts Installed in Windows Do Not Appear in Fonts Preferences Page *(on page 3048)*.

Author default font

Specifies the default font family, size, and weight to be used in **Author** mode. However, the default font will be overridden by the fonts specified in any CSS file associated with the open document. To change the current values, double-click the text field or click the **Choose** button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the **Sample** box to see a preview of how it will look in the application. If you select the **Show only the fonts that can render the sample text** option and paste content in the **Sample** box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

Schema default font

This option allows you to choose the font to be used in:

- The **Design** mode.
- Images with schema diagram fragments that are included in the HTML documentation generated from an XML Schema.

To change the current values, double-click the text field or click the **Choose** button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the **Sample** box to see a preview of how it will look in the application. If you select the **Show only the fonts that can render the sample text** option and paste content in the **Sample** box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

Text antialiasing

This option allows you to set the text anti-aliasing behavior:

- **Default** - Allows the application to use the setting of the operating system, if available.
- **On** - Sets the text anti-aliasing to pixel level.
- **Off** - Disables text anti-aliasing.
- Sub-pixel anti-aliasing modes, such as GASP, LCD_HRGB, LCD_HBGR, LCD_VRGB, and LCD_VBGR.

Text components

Specifies the font family, size, and weight to be used in text boxes within the interface. This same font influences the appearance of the content in the **Project** and **DITA Maps Manager** views. To change the current values, double-click the text field or click the **Choose** button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the **Sample** box to see a preview of how it will look in the application. If you select the **Show only the fonts that can render the sample text** option and paste content in the **Sample** box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

GUI

Specifies the font family, size, and weight to be used for user interface labels. To change the current values, double-click the text field or click the **Choose** button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the **Sample** box to see a preview of how it will look in the application. If you select the **Show only the fonts that can render the sample text** option and paste content in the **Sample** box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

View titles font

Specifies the font family, size, and weight to be used in the titles of the various views within the interface. To change the current values, double-click the text field or click the **Choose** button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the **Sample** box to see a preview of how it will look in the application. If you select the **Show only the fonts that can render the sample text** option and paste content in the **Sample** box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

Note:
You must restart the application for your changes to be applied.

Related information
Changing the Font Size in the Editor *(on page 531)*

Application Layout Preferences

Oxygen XML Editor offers various *perspectives (on page 3422)* and views that you can arrange in a variety of layouts to suit your needs.

To configure the application layout options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Application Layout**. The following options are available:

Select application layout

You can choose between the following three layouts:

Default

Uses the default layout for all *perspectives (on page 3422)*. Any modification of this layout (such as closing views, displaying views, or a new view arrangement) is saved on exit and reloaded at start-up.

Predefined

Allows you to choose one of the predefined layouts.

- **Advanced** - All views are displayed.
- **Author** - An authoring-oriented layout that includes the following views: **Project** *(on page 413)*, **Archive Browser** *(on page 2126)*, **DITA Maps Manager** *(on page 3073)*, **Outline** *(on page 549)*, **Attributes** *(on page 638)*, **Model** *(on page 555)*, and **Elements** *(on page 643)*.
- **Basic** - Only the **Project** view *(on page 413)* and **Outline** view *(on page 549)* are visible. Recommended when you edit XML content and you need maximum screen space.
- **Schema development** - The **Project** *(on page 413)*, **Component Dependencies** *(on page 1013)*, **Referenced/Dependent Resources** *(on page*

1010), **Outline** *(on page 1006)*, **Palette** *(on page 962)*, and **Attributes** *(on page 1008)* views are displayed.

- **XQuery development** - The **Project** *(on page 413)*, **Outline** *(on page 1050)*, **XSLT/XQuery Input** *(on page 917)*, **XPath/XQuery Builder** *(on page 1052)*, and **Transformation Scenarios** *(on page 1607)* views are displayed.
- **XSLT development** - The **Project** *(on page 413)*, **Component Dependencies** *(on page 922)*, **Referenced/Dependent Resources** *(on page 919)*, **Outline** *(on page 912)*, **Attributes** *(on page 552)*, **Model** *(on page 555)*, **XSLT/XQuery Input** *(on page 917)*, **XPath/XQuery Builder** *(on page 1052)*, and **Transformation Scenarios** *(on page 1607)* views are displayed.

Custom

Allows you to specify a custom layout to be used. You can save your preferred layout using **Window > Export Layout**, then enter the location of the saved layout file in this setting.

Reset layout at startup

When this option is selected, Oxygen XML Editor forgets any changes made to the layout during a session and reloads the default layout the next time it is started. This is useful when you want to keep a fixed layout from one session to another.

Remember layout changes for each project

When this option is selected, Oxygen XML Editor saves layouts individually for each project. When you switch projects, the layout you last used for that project is loaded automatically.

Allow detaching of editors from main window

When this option is selected, you can drag and drop an editor window outside of the main screen. This is useful especially when you are using two monitors and you want to view files side by side.

Note:
If the main screen is maximized, you cannot drag and drop an editor outside of it.

View tab placement

Specifies whether the *View* tabs are located at the top or bottom of the window.

Editor tab placement

Specifies whether the *Editor* tabs are located at the top or bottom of the window.

The changes you make to any layout are preserved between working sessions. The predefined *layout* files are saved in the `preferences` directory of Oxygen XML Editor.

Resources

For more information about configuring the user interface of Oxygen XML Editor, watch our video demonstration:

https://www.youtube.com/embed/anwjepfAdEk

Add-ons Preferences

You can use *add-ons (on page 3422)* to enhance the functionality of Oxygen XML Editor. To configure the **Add-ons** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Add-ons**.

The following options are available in this preferences page:

Enable automatic updates checking

When this option is selected, Oxygen XML Editor will automatically search for available updates.

Add-on Sites URLs

This is a list of the URLs for the add-on sites. You can add, edit, and delete sites in this list by using the buttons below the list.

Automatically install add-ons

You can use this section to specify required add-ons for a project. Then, when a user opens the project, the specified add-ons will be automatically installed after prompting the user. You can use **Ctrl+Space** to open a pop-up window with the list of detected add-ons that you can select to be marked for automatic installation. You can also manually enter the add-on ID and multiple IDs can be entered by separating with either a space or new line.

Project Level Settings Preferences

The **Project Level Settings** preference page allows you to decide whether various settings should be saved in the project configuration file or in the global settings. Settings that are saved at project level can easily be shared with others. To configure these options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Project Level Settings**.

The following options can be toggled on or off to determine which settings will be saved at project level:

Allow validation scenario associations to be saved at project level

When this option is selected, the associations for custom validation scenarios *(on page 799)* will be stored according to their storage location.

- If you associate a scenario that is stored at the project or framework level, the association will be saved at project level (in the project configuration file).
- If you associate a scenario at global level, it will be saved globally.

If this option is not selected, the association is not allowed to be saved at project level and will be saved globally (even if the scenario is saved in the project file).

Allow transformation scenario associations to be saved at project level

When this option is selected, the associations for custom transformation scenarios *(on page 1504)* will be stored according to their storage location.

- If you associate a scenario that is stored at the project or framework level, the association will be saved at project level (in the project configuration file).
- If you associate a scenario at global level, it will be saved globally.

If this option is not selected, the association is not allowed to be saved at project level and will be saved globally (even if the scenario is saved in the project file).

Save current DITA root map at project level

When this option is selected, when you change the currently selected DITA context root map *(on page 3077)*, it will be saved in the project configuration file.

Save DITA media working sets at project level

When this option is selected, all configured working sets for DITA media resources *(on page 3249)* will be saved in the project configuration file.

Save DITA map validate and check for completeness settings at project level

When this is selected, the options chosen in the DITA Map Validate and Check for Completeness dialog box *(on page 3118)* will be saved in the project configuration file.

Document Type Association Preferences

Oxygen XML Editor uses *document type associations (on page 3419)* to associate a document type *(on page 1327)* with a set of functionality provided by a *framework (on page 3420)*. To configure the **Document Type Association** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Document Type Association**.

The following actions are available in this preferences page:

Discover more frameworks by using add-ons update sites

Click on this link to specify URLs for *framework* add-on update sites.

Document Type Table

This table presents the currently defined *frameworks (on page 3420)* (*document type associations (on page 3419)*), sorted by priority and alphabetically. Each edited document type has a set of association rules *(on page 149)* (used by the application to detect the proper document type association to use for an open XML document).

Disable all

Disables all document types listed in the table.

New

Opens a **Document type** configuration dialog box *(on page 147)* that allows you to add a new *framework*.

Edit

Opens a **Document type** configuration dialog box *(on page 147)* that allows you to edit an existing *framework*.

Note:
If you try to edit an existing *framework* when you do not have write permissions to its storage location, a dialog box will be shown asking if you want to extend it.

Duplicate

Opens a **Document type** configuration dialog box *(on page 147)* that allows you to duplicate the configuration of an existing *framework*. This will create a snapshot of the *framework* in its current form. It is merely a copy of the document type and will not *evolve* along with the base document type as the **Extend** action does.

Extend

Opens a **Document type** configuration dialog box *(on page 147)* that allows you to extend an existing *framework*. You can add or remove functionality starting from a base document type. All of these changes will be saved as a patch. When the base document type is modified and evolves (for example, from one application version to another) the extension will evolve along with the base document type, allowing it to use the new actions added in the base document type.

Delete

Deletes the selected *framework* (document type).

Enable DTD/XML Schema processing in document type detection

When this option is selected (default value), the matching process also examines the DTD/XML Schema associated with the document. For example, the fixed attributes declared in the DTD for the root element are also analyzed, if this is specified in the association rules. This is especially useful if you are writing DITA customizations. DITA topics and maps are also matched by looking for the `@DITAArchVersion` attribute of the root element. This attribute is specified as `default` in the DTD and it is detected in the root element, helping Oxygen XML Editor to correctly match the DITA customization.

Only for local DTDs/XML Schemas

When this option is selected (default value), only the local DTDs / XML Schemas will be processed.

Enable DTD/XML Schema caching

When this option is selected (default value), the associated DTDs or XML Schema are cached when parsed for the first time, improving performance when opening new documents with similar schema associations.

Related information

Sharing a Framework *(on page 2406)*

Locations Preferences

Oxygen XML Editor allows you to change the location where *frameworks (on page 3420)* (document types) are stored, and to specify additional *framework* directories. The **Locations** preferences page allows you to specify the main `frameworks` folder location. You can choose between the **Default** directory (*`[OXYGEN_INSTALL_DIR]/frameworks`*) or a **Custom** specified directory. You can also change the current `frameworks` folder location value using the `com.oxygenxml.editor.frameworks.url` system property set in either the *.vmoptions* configuration files *(on page 349)* or in the startup scripts *(on page 351)*.

A list of additional `frameworks` directories can also be specified. The application will look in each of those folders for additional document type configurations to load. Use the **Add**, **Edit** and **Delete** buttons to manage the list of folders.

A document type configuration (*framework*) can be loaded from the following locations:

- **Internal preferences** - The document type configuration is stored in the application **Internal** preferences *(on page 148)*.
- **Additional *framework* directories** - The document type configuration is loaded from one of the specified **Additional frameworks directories** list.
- **Add-ons** - An *add-on (on page 3422)* can contribute a *framework*. You can manage the add-ons locations in the Add-ons preferences page *(on page 144)*.
- **The `frameworks` folder** - The main folder containing *framework* configurations.

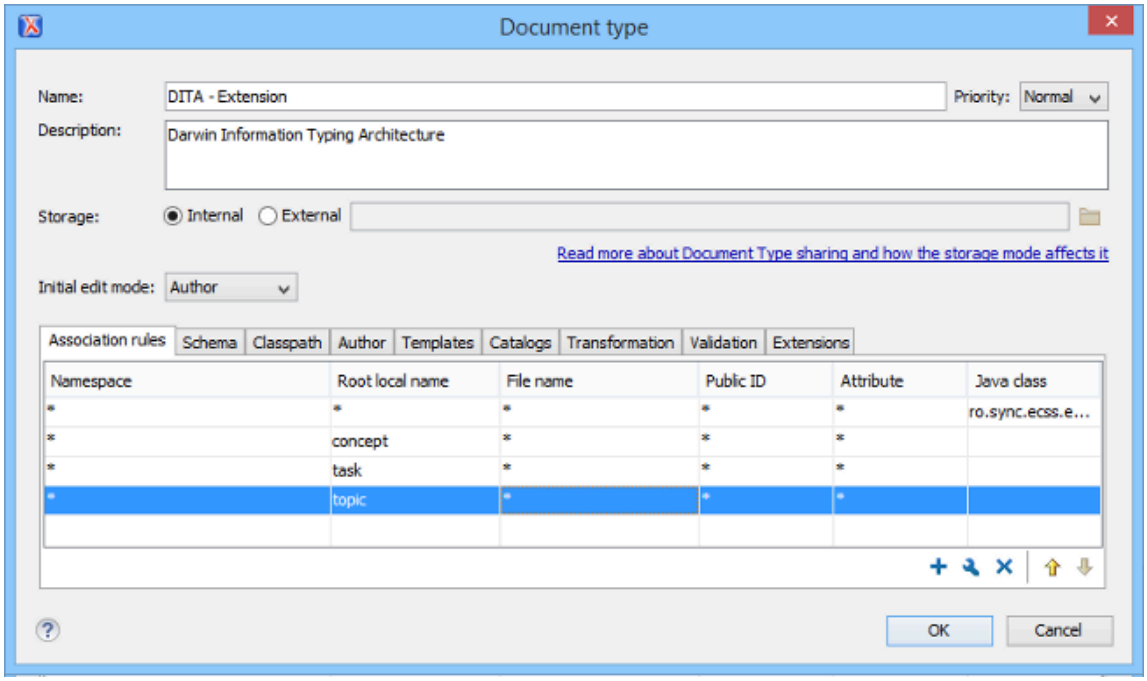
All loaded document type configurations are first sorted by priority, then by document type name and then by load location (in the exact order specified above). When an XML document is opened, the application chooses the first document type configuration from the sorted list that matches the specific document.

All loaded document type configurations are first sorted by priority, then by document type.

Document Type Configuration Dialog Box

The **Document Type Configuration** dialog box allows you to create or edit a *framework (on page 3420)* (document type). It is displayed when you use the **New**, **Edit**, **Duplicate**, or **Extend** buttons in the **Document Type Association** preferences page *(on page 145)* (open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Document Type Association**).

Figure 21. Document Type Configuration Dialog Box



The configuration dialog box includes the following fields and sections:

Name

The name of the *framework*. This will be displayed as its name in the **Document Type** column in the **Document Type Association** preferences page *(on page 145)*.

Priority

Depending on the priority level, Oxygen XML Editor establishes the order that the existing *frameworks* are evaluated to determine the type of a document you are opening. It can be one of the following: Lowest, Low, Normal, High, or Highest. You can set a higher priority for *frameworks* you want to be evaluated first.

Note:
The built-in document types are set to Low priority by default. *Frameworks* that have the same priority are sorted alphabetically.

Description

The document type description displayed as a tooltip in the **Document Type Association** preferences page *(on page 145)*.

Storage

The location where the framework is saved. If you select the **External** storage option, the framework is saved in a specified file with a mandatory extension (located in a subdirectory of your current framework directory. If you select the **Internal** storage option, the framework configuration data is saved in the Oxygen XML Editor internal options file (if Global Options *(on*

page 321) is selected) or in the current Oxygen XML Editor project *xpr* file (if Project Options *(on page 321)* is selected).

Initial edit mode

Sets the default edit mode when you open a document for the first time: **Editor specific**, **Text**, **Author, Grid** and **Design** (available for the W3C XML Schema editor). If the **Editor specific** option is selected, the initial editing mode is determined based upon the document type. You can find the mapping between editors and edit modes in the **Edit modes** preferences page. *(on page 178)* You can impose an initial mode for opening files that match the association rules of the document type. For example, if the files are usually edited in the **Author** mode, you can set it in the **Initial edit mode** combo box.

> **Note:**
> You can also customize the initial mode for a document type in the **Edit modes** preferences page. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes**.

Configuration Tabs

The bottom section of the dialog box includes various tabs where you can configure numerous options for the *framework*.

Related information

Creating and Configuring Custom Frameworks *(on page 2248)*
Sharing a Framework *(on page 2406)*
Localizing Frameworks *(on page 2347)*

Association Rules Tab

To open the **Association Rules** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 145)*, and click on the **Association Rules** tab.

In the **Association rules** tab, you can perform the following actions:

New

Opens the **Document type rule** dialog box allowing you to create *association rules*.

Edit

Opens the **Document type rule** dialog box allowing you to edit the properties of the currently selected *association rule*.

Delete

Deletes the currently selected *association rules* from the list.

Move Up

Moves the selected *association rule* up one spot in the list.

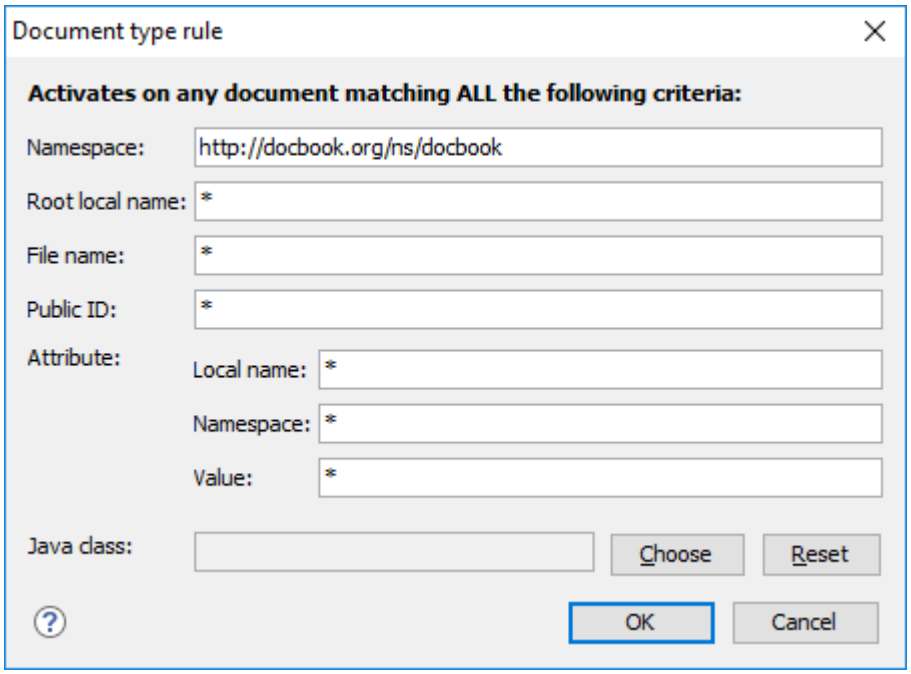
Move Down

Moves the selected *association rule* down one spot in the list.

By combining multiple association rules you can instruct Oxygen XML Editor to identify the type of a document. Oxygen XML Editor identifies the type of a document when the document matches at least one of the *association rules*. This tab gives you access to a **Document type rule** dialog box that you can use to create *association rules* that activate on any document matching all the criteria defined in the dialog box.

To create a new association rule, click the **New** button at the bottom of the **Association Rules** tab, or to edit an existing rule, click the **Edit** button.

Figure 22. Document Type Rule Dialog Box



The **Document type rule** dialog box includes the following fields and options:

Namespace

Specifies the namespace of the root element from the association rules set (* *(any)* by default). If you want to apply the rule only when the root element has no namespace, leave this field empty (remove the **ANY_VALUE** string).

Root local name

Specifies the local name of the root element (* *(any)* by default).

File name

Specifies the name of the file (* *(any)* by default).

Public ID

Represents the Public ID of the matched document.

Attribute Local name

Specifies the local name of the attributes for the root element (* *(any)* by default).

Attribute Namespace

Specifies the namespace of the attributes for the root element (* *(any)* by default).

Attribute Value

Specifies the value of the attributes for the root element (* *(any)* by default).

Java class

Presents the name of the Java class that is used to determine if a document matches the rule. This Java class should implement the `ro.sync.ecss.extensions.api.DocumentTypeCustomRuleMatcher` interface.

Tip:
You can use wildcards (*?* and *) or editor variables *(on page 332)* in the **Document Type Rule** dialog box, and you can enter multiple values by separating them with a comma.

Schema Tab

In the **Schema** tab, you can specify a default schema for Oxygen XML Editor to use if a document does not contain a schema declaration and no default validation scenario is associated with it.

To open the **Schema** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 145)*, and click on the **Schema** tab.

This tab includes the following options for defining a schema to be used if no schema is detected in the XML file:

Schema type

Use this drop-down list to select the type of schema.

Schema URI

You can specify the URI of the schema file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.

Tip:
It is a good practice to store all resources in the *framework* directory and use the *${framework}* editor variable *(on page 339)* to reference them. This is a recommended approach to designing a self-contained document type that can be easily maintained and shared between multiple users.

Classpath Tab

The **Classpath** tab displays a list of folders and *JAR (on page 3420)* libraries that hold implementations for API extensions, implementations for custom **Author** mode operations, various resources (such as stylesheets), and *framework (on page 3420)* translation files. Oxygen XML Editor loads the resources looking in the folders in the order they appear in the list (from top to bottom).

To open the **Classpath** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 145)*, and click on the **Classpath** tab.

The **Classpath** tab includes the following actions:

New

Opens a dialog box that allows you to add a resource to the table in the **Classpath** tab. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.

> **Tip:**
> The path can also contain wildcards (for example, `${framework}/lib/*.jar`).

Edit

Opens a dialog box that allows you to edit a resource in the **Classpath** tab. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.

> **Tip:**
> The path can also contain wildcards (for example, `${framework}/lib/*.jar`).

Delete

Deletes the currently selected resource from the list.

Move Up

Moves the selected resource up one spot in the list.

Move Down

Moves the selected resource down one spot in the list.

Use parent classloader from plugin with ID *(on page 2564)*

Use this option to specify the ID of a *plugin (on page 3422)*. The current *framework* has access to the classes loaded for the *plugin*.

Related information

Extensions Tab *(on page 174)*

Author Tab *(on page 153)*

Localizing Frameworks *(on page 2347)*

Author Tab

The **Author** tab is a container that holds information regarding the CSS file used to render a document in the **Author** mode, and regarding *framework (on page 3420)*-specific actions, menus, contextual menus, toolbars, and content completion list of proposals.

To open the **Author** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 145)*, and click on the **Author** tab.

The options that you configure in the **Author** tab are grouped in subtabs.

CSS Subtab

The **CSS** subtab contains the CSS files that Oxygen XML Editor uses to render a document in the **Author** mode. In this subtab, you can set *main* and *alternate* CSS files. When you are editing a document in the **Author** mode, you can switch between these CSS files from the **Styles** drop-down menu on the **Author Styles** toolbar.

To open the **CSS** subtab, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 145)*, click on the **Author** tab, and then the **CSS** subtab.

The following actions are available in the **CSS** subtab:

New

Opens a dialog box that allows you to add a CSS file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.

Edit

Opens a dialog box that allows you to edit the current selection.

Delete

Deletes the currently selected CSS file.

Move Up

Moves the selected CSS file up in the list.

Move Down

Moves the selected CSS file down in the list.

Enable multiple selection of alternate CSSs

Allows users to apply multiple alternate styles, as layers, over the main CSS style. This option is selected by default for DITA document types.

If there are CSSs specified in the document then

You can choose between the following options for controlling how the CSS files that are set in this subtab will be handled if a CSS is specified in the document itself:

- **Ignore CSSs from the associated document type** - The CSS files set in this CSS subtab are overwritten by the CSS files specified in the document itself.
- **Merge them with CSSs from the associated document type** - The CSS files set in this CSS subtab are merged with the CSS files specified in the document itself.

Configuring and Managing Multiple CSS Styles for a Framework *(on page 2262)*

Actions Subtab

The **Actions** subtab of the **Document Type Configuration** dialog box contains a sortable table with all the **Author** mode actions that are configured for the specific *framework (on page 3420)*. Each action has a unique ID, a name, a description, and a shortcut key.

To open the **Actions** subtab, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, select your framework, use the **Duplicate** or **Extend** button to create an extension of the framework (or the **Edit** button for an already extended framework), click on the **Author** tab, and then the **Actions** subtab.

The following features are available in this subtab:

Export existing actions ( )

It is possible to export existing actions to use them in other frameworks. Each exported action is extracted from the framework configuration file and exported as an individual XML file.

To export actions, the **Storage** option *(on page 148)* in the top part of the **Document Type Configuration** dialog box must be set to **External** and the external location must be a subdirectory of your current framework directory.

The **Export** action is found by right-clicking an action or a selection of multiple actions (the **Export** button is also located below the table of actions). If you choose to export a single action, a resulting dialog box will allow you to select the destination path for the new XML file that contains the configuration details of the action. If you export multiple actions, they will automatically be saved as individual XML files inside a newly created folder (it will have ***_externalAuthorActions*** at the end of the folder name) inside your current framework directory.

Result: Exported actions will display the icon in the first column in the table.

Important:
The newly created files for the exported actions will not appear on disk until you click **OK** several times to confirm your changes and exit the **Preferences** dialog box.

Tip:
If you want to create a new XML file for an action, there is a document template called **Author Actions** in the **New** document wizard *(on page 377)* to help you get started.

Note:
You can add or edit the action files outside of Oxygen XML Editor, but you will need to restart the application each time to reload the changes.

For more information, see Creating or Editing Actions Using an Individual XML File for Each Action *(on page 2265)*.

Open in editor ( )

For exported actions, there is a **Open in editor** action in the contextual menu that will open the file for that action in the main editor.

Create a new action ( )

Use the **New** button (located underneath the table of actions) to open the **Action** dialog box *(on page 155)* where you can configure a new action.

Duplicate an existing action ( )

Use the **Duplicate** action (found in the contextual menu and underneath the table of actions) to duplicate the selected action.

Edit an existing action ( )

Use the **Edit** button (found in the contextual menu and underneath the table of actions) to open the **Action** dialog box *(on page 155)* where you can edit the selected action.

Delete an existing action ( )

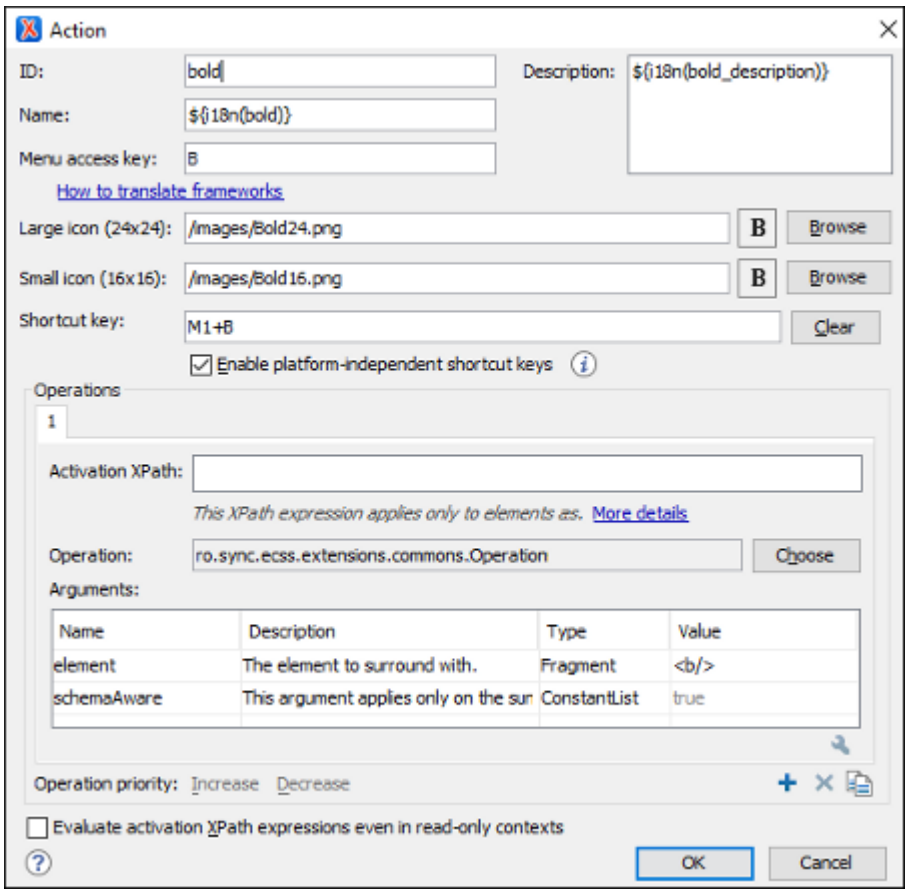
Use the **Delete** button (found in the contextual menu and underneath the table of actions) to delete the selected action.

Author Action Dialog Box

To edit an existing document type action or create a new one, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend**

button *(on page 145)*, click on the **Author** tab, and then the **Actions** subtab. At the bottom of this subtab, click **New** to create a new action, or **Edit** to modify an existing one.

Figure 23. Action Dialog Box



The following options are available in the **Action** dialog box:

ID

Specifies a unique action identifier.

Name

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

> **Tip:**
> You can use the **${i18n('key')}** editor variable *(on page 340)* to allow for multiple translations of the name.

Menu access key

In Windows, you can access menus by holding down **Alt** and pressing the keyboard key that corresponds to the *letter* that is underlined in the name of the menu. Then, while still holding down **Alt**, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the *letter* in the name of the action that can be used to access the action.

Description

A description of the action. This description is displayed as a tooltip when hovering over the action.

> **Tip:**
> You can use the **${i18n('key')}** editor variable *(on page 340)* to allow for multiple translations of the description.

How to translate frameworks link

Use this link to see more information about Localizing Frameworks *(on page 2347)*.

Large icon

Allows you to select an image for the icon that Oxygen XML Editor uses for the toolbar action.

> **Tip:**
> A good practice is to store the image files inside the *framework* directory and use the *${frameworks}* editor variable *(on page 340)* to make the image relative to the *framework* location. If the images are bundled in a *jar* archive (for instance, along with some Java operations implementation), it is convenient to reference the images by their relative path location in the *class-path*.

Small icon

Allows you to select an image for the icon that Oxygen XML Editor uses for the contextual menu action.

> **Note:**
> If you are using a Retina or HiDPI display, Oxygen XML Editor automatically searches for higher resolution icons in the path specified in both the **Large icon** and **Small icon** options. For more information, see Using Retina/HiDPI Icons for the Actions from a Framework *(on page 2299)*.

Shortcut key

This field allows you to configure a shortcut key for the action that you are editing. The `+` character separates the keys.

Enable platform-independent shortcut keys

If this checkbox is selected, the shortcut that you specify in this field is platform-independent and the following modifiers are used:

- **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
- **M2** represents the **Shift** key.
- **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
- **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.

Operations section

In this section of the **Action** dialog box, you configure the functionality of the action that you are editing. An action has one or more operation modes. The evaluation of an XPath expression activates an operation mode. The first selected operation mode is activated when you trigger the action. The scope of the XPath expression must consist only of element nodes and attribute nodes of the edited document. Otherwise, the XPath expression does not return a match and does not fire the action. For more details see: Controlling Which Author Operations Gets Executed Through XPath Expressions *(on page 159)*.

The following options are available in this section:

Activation XPath

An XPath 2.0 expression that applies to elements and attributes. For more details see: Controlling Which Author Operations Gets Executed Through XPath Expressions *(on page 159)*.

Operation

Specifies the invoked operation that can be a default operation *(on page 2269)* or a custom operation *(on page 2295)*.

Arguments

Specifies the arguments of the invoked operation. The **Edit** at the bottom of the table allows you to edit the arguments of the operation.

Operation priority

Increases or decreases the priority of an operation. The operations are invoked in the order of their priority. If multiple XPath expressions are true, the operation with the highest priority is invoked.

- **Add** - Adds an operation.
- **Remove** - Removes an operation.
- **Duplicate** - Duplicates an operation.

Evaluate activation XPath expressions even in read-only contexts

If this checkbox is selected, the action can be invoked even when the cursor is placed in a read-only location.

Related information

Localizing Frameworks *(on page 2347)*

Controlling Which Author Operations Gets Executed Through XPath Expressions

An **Author** mode action can have multiple operation modes, each one invoking an Author operation *(on page 2269)* with certain configured parameters. Each operation mode has an XPath 2.0 expression for activating it.

For each operation mode of an action, the application will check if the XPath expression is fulfilled (when it returns a non-empty node set or a **true** result). Only the first operation whose XPath operation is fulfilled will be executed.

The following special XPath extension functions are provided:

- *oxy:allows-child-element() (on page 159)* - Use this function to check whether or not an element is valid child element in the current context, according to the associated schema.
- *oxy:allows-global-element() (on page 161)* - Use this function to check whether or not an element is a valid global element for the current *framework (on page 3420)*, according to the associated schema.
- *oxy:current-selected-element() (on page 163)* - Use this function to get the currently selected element.
- *oxy:selected-elements() (on page 163)* - Use this function to get the selected elements.
- *oxy:is-required-element() (on page 163)* - Use this function to check if the element returned by the given XPath expression is required (based on the rules declared in the schema).
- *oxy:platform() (on page 164)* - Use this function to get the current platform in cases where you want to enable or disable an action depending on the platform. Possible values include: *eclipse*, *standalone* and *webapp*.

oxy:allows-child-element() Function

The **oxy:allows-child-element()** function allows you to check whether or not an element that matches the arguments of the function is valid as a child of the element at the current cursor position, according to the associated schema. It is evaluated at the cursor position and has the following signature:

```
oxy:allows-child-element($childName, ($attributeName, $defaultAttributeValue, $contains?)?)
```

The following parameters are supported:

`childName`

The name of the element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The child element with the specified local name that belongs to the default namespace.

```
oxy:allows-child-element("para")
```

The above example verifies if the `<para>` element (of the default namespace) is allowed in the current context.

- The child element with the local name specified by any namespace.

```
oxy:allows-child-element("*:para")
```

The above example verifies if the `<para>` element (of any namespace) is allowed in the current context.

- A prefix-qualified name of an element.

```
oxy:allows-child-element("prefix:para")
```

The prefix is resolved in the context of the element where the cursor is located. The function matches on the element with the `para` local name from the previously resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of `false`.

- A specified namespace-URI-qualified name of an element.

```
oxy:allows-child-element("{namespaceURI}para")
```

The `namespaceURI` is the namespace of the element. The above example verifies if the `<para>` element (of the specified namespace) is allowed in the current context.

- Any element.

```
oxy:allows-child-element("*")
```

The above function verifies if any element is allowed in the current context.

Note:
A common use case of `oxy:allows-child-element("*")` is in combination with the `attributeName` parameter.

`attributeName`

The attribute of an element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

```
oxy:allows-child-element("*", "class", " topic/topic ")
```

The above example verifies if an element with the `@class` attribute and the default value of this attribute (that contains the `topic/topic` string) is allowed in the current context.

- The attribute with the local name specified by any namespace.

```
oxy:allows-child-element("*", "*:localname", " topic/topic ")
```

- A qualified name of an attribute.

```
oxy:allows-child-element("*", "prefix:localname", " topic/topic ")
```

The prefix is resolved in the context of the element where the cursor is located. If the prefix is not resolved to a namespace, the function returns a value of `false`.

`defaultAttributeValue`

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal to it.

`contains`

An optional boolean. The default value is `true`. For the `true` value, the default value of the attribute must contain the `defaultAttributeValue` parameter. If the value is `false`, the two values must be the same.

oxy:allows-global-element() Function

The **oxy:allows-global-element()** function allows you to check whether or not an element that matches the arguments of the function is valid for the current *framework (on page 3420)*, according to the associated schema. It has the following signature:

```
oxy:allows-global-element($elementName, ($attributeName, $defaultAttributeValue, $contains?)?)
```

The following parameters are supported:

`elementName`

The name of the element that you want to check if it is valid in the current *framework*. Its value is a string that supports the following forms:

- The element with the specified local name that belongs to the default namespace.

```
oxy:allows-global-element("para")
```

The above example verifies if the `<para>` element (of the default namespace) is allowed in the current *framework*.

- The element with the local name specified by any namespace.

```
oxy:allows-global-element("*:para")
```

The above example verifies if the `<para>` element (of any namespace) is allowed in the current *framework*.

- A prefix-qualified name of an element.

```
oxy:allows-global-element("prefix:para")
```

The prefix is resolved in the context of the *framework*. The function matches on the element with the `para` local name from the previously resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of `false`.

- A specified namespace-URI-qualified name of an element.

```
oxy:allows-global-element("{namespaceURI}para")
```

The `namespaceURI` is the namespace of the element. The above example verifies if the `<para>` element (of the specified namespace) is allowed in the current *framework*.

- Any element.

```
oxy:allows-global-element("*")
```

The above function verifies if any element is allowed in the current *framework*.

`attributeName`

The attribute of an element that you want to check if it is valid in the current *framework*. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

```
oxy:allows-global-element("*", "class", " topic/topic ")
```

The above example verifies if an element with the `class` attribute and the default value of this attribute (that contains the `topic/topic` string) is allowed in the current *framework*.

- The attribute with the local name specified by any namespace.

```
oxy:allows-global-element("*", "*:localname", " topic/topic ")
```

- A qualified name of an attribute.

```
oxy:allows-global-element("*", "prefix:localname", " topic/topic ")
```

The prefix is resolved in the context of the *framework*. If the prefix is not resolved to a namespace, the function returns a value of `false`.

`defaultAttributeValue`

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal to it.

`contains`

An optional boolean. The default value is `true`. For the `true` value, the default value of the attribute must contain the `defaultAttributeValue` parameter. If the value is `false`, the two values must be the same.

oxy:current-selected-element() Function

This function returns the fully selected element. If no element is selected, the function returns an empty sequence.

Example: *oxy:current-selected-element* Function

```
oxy:current-selected-element()[self::p]/b
```

This example returns the `<b>` elements that are children of the currently selected `<p>` element.

oxy:selected-elements() Function

This function returns the selected elements from **Author** mode.

Example: *oxy:selected-elements* Function

```
oxy:selected-elements()[self::para][@audience="novice"]
```

This example would activate an action when at least one of the selected elements is a `<para>` element with the `@novice` attribute defined.

oxy:is-required-element() Function

This function checks if the element returned by the given XPath expression is required (based on the rules declared in the schema). It has only one argument, an XPath expression, and the XPath expression must be written in such a way that it returns a single element.

Example: *oxy:is-required-element* Function

```
oxy:is-required-element(.)
```

This example would check to see if the current element is required by the schema.

oxy:is-editable-element() Function

This function checks if the element returned by the given XPath expression is editable (content can be inserted in it), meaning both that the entire XML file is editable and that the current context where the element is placed is editable. For example, if the element is inside an *xi:included* section, it is not editable.

It only has one argument, an XPath expression, and the XPath expression must be written in such a way that it returns a single element.

Example: *oxy:is-editable-element* Function

```
oxy:is-editable-element(ancestor-or-self::table)
```

This example would return *true* if the cursor is placed inside a table and it is editable or *false* if it is not editable.

oxy:platform() Function

This function returns the current platform. You can use this if you want to enable or disable an action depending on the platform. The possible values are: **standalone**, **eclipse**, or **webapp**.

Example: *oxy:platform* Function

```
oxy:platform()="standalone"
```

This example would keep the action activated for the *standalone* distribution of Oxygen XML Editor, but disable it for the *Eclipse* and *Web Author* distributions.

Menu Subtab

In the **Menu** subtab, you can configure which actions will appear in the *framework (on page 3420)*-specific menu. The subtab is divided into two sections: **Available actions** and **Current actions**.

To open the **Menu** subtab, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 145)*, click on the **Author** tab, and then the **Menu** subtab.

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Editor menu. To add an action in this section as a sibling of the currently selected action, use the **Add as sibling** button. To add an image in this section as a child of the currently selected action, use the **Add as child** button.

The following actions are available in the **Current actions** section:

Edit

Edits an item.

Remove

Removes an item.

Move Up

Moves an item up.

Move Down

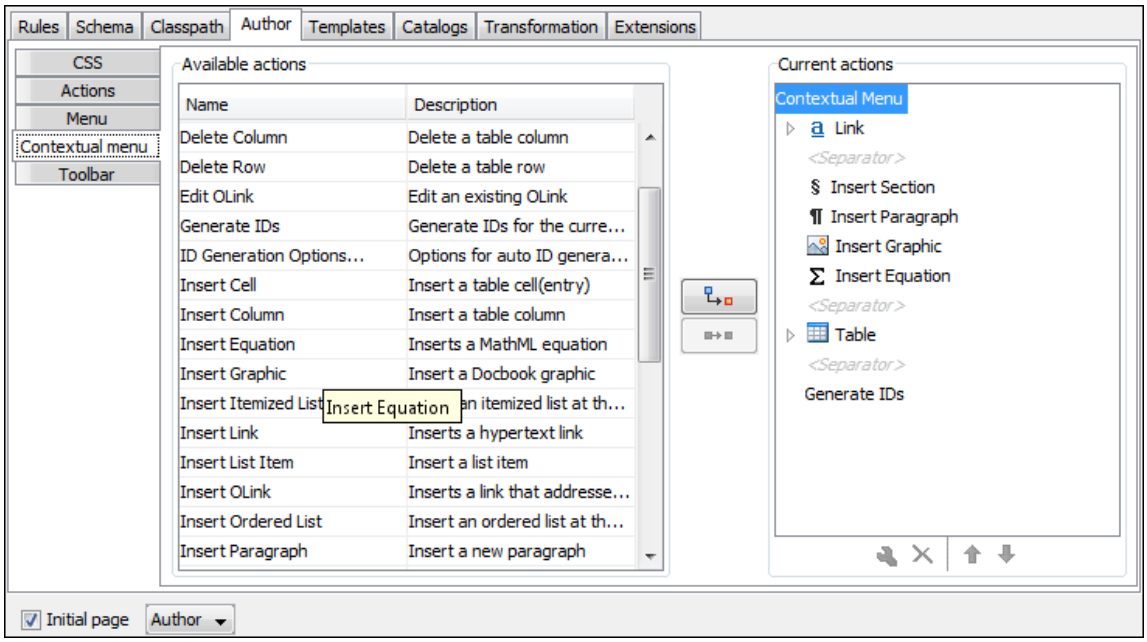
Moves an item down.

Contextual Menu Subtab

In the **Contextual menu** subtab you configure what *framework (on page 3420)*-specific action the *Content Completion Assistant (on page 3418)* proposes. The subtab is divided into two sections: **Available actions** and **Current actions**.

To open the **Contextual Menu** subtab, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 145)*, click on the **Author** tab, and then the **Contextual Menu** subtab.

Figure 24. Contextual Menu Subtab



The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section contains the actions that are displayed in the contextual menu for documents that belong to the edited *framework*.

The following actions are available in this subtab:

Add as sibling

Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a sibling of the selected action.

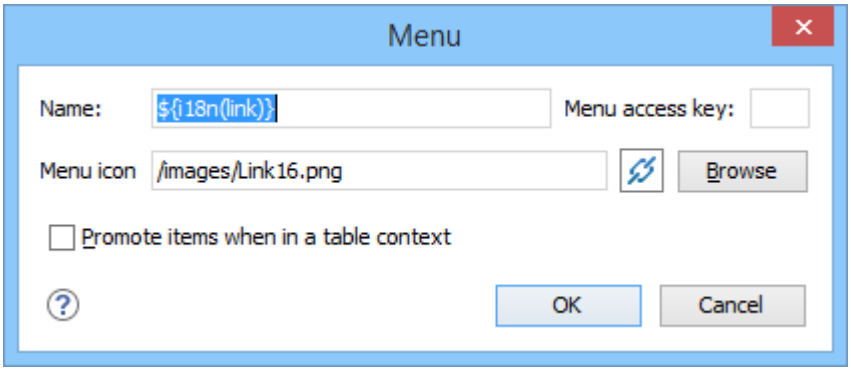
Add as child

Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a child of the selected action.

Edit

This option is available for container (submenu) items that are listed in the **Current actions** section. It opens a configuration dialog box that allows you to edit the selected container (submenu).

Figure 25. Menu Action Configuration Dialog Box



The following options are available in this dialog box:

Name

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

> **Tip:**
> You can use the **${i18n('key')}** editor variable *(on page 340)* to allow for multiple translations of the name.

Menu access key

In Windows, you can access menus by holding down **Alt** and pressing the keyboard key that corresponds to the *letter* that is underlined in the name of the menu. Then, while still holding down **Alt**, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the *letter* in the name of the action that can be used to access the action.

Menu icon

Allows you to select an image for the icon that Oxygen XML Editor uses for the container (submenu).

Promote items when in a table context

If this option is selected, when invoking the contextual menu from within a table, all the actions in this container (submenu) will be promoted to the main level in the contextual menu. Actions and submenus that are not promoted are still available in the **Other actions** submenu when invoking the contextual menu within a table.

Remove

Removes the selected action or submenu from the **Current actions** section.

Move Up

Moves the selected item up in the list.

Move Down

Moves the selected item down in the list.

Toolbar Subtab

In the **Toolbar** subtab you configure what *framework (on page 3420)*-specific action the Oxygen XML Editor toolbar holds. The subtab is divided into two sections: **Available actions** and **Current actions**.

To open the **Toolbar** subtab, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 145)*, click on the **Author** tab, and then the **Toolbar** subtab.

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Editor toolbar when you work with a document belonging to the edited *framework*. To add an action in this section as a sibling of the currently selected action, use the **Add as sibling** button. To add an action in this section as a child of the currently selected action, use the **Add as child** button.

The following actions are available in the **Current actions** section:

Edit

Edits an item.

Remove

Removes an item.

Move Up

Moves an item up.

Move Down

Moves an item down.

Content Completion Subtab

In the **Content Completion** subtab you configure what *framework (on page 3420)*-specific the *Content Completion Assistant (on page 3418)* proposes. The subtab is divided into two sections: **Available actions** and **Current actions**.

To open the **Content Completion** subtab, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 145)*, click on the **Author** tab, and then the **Content Completion** subtab.

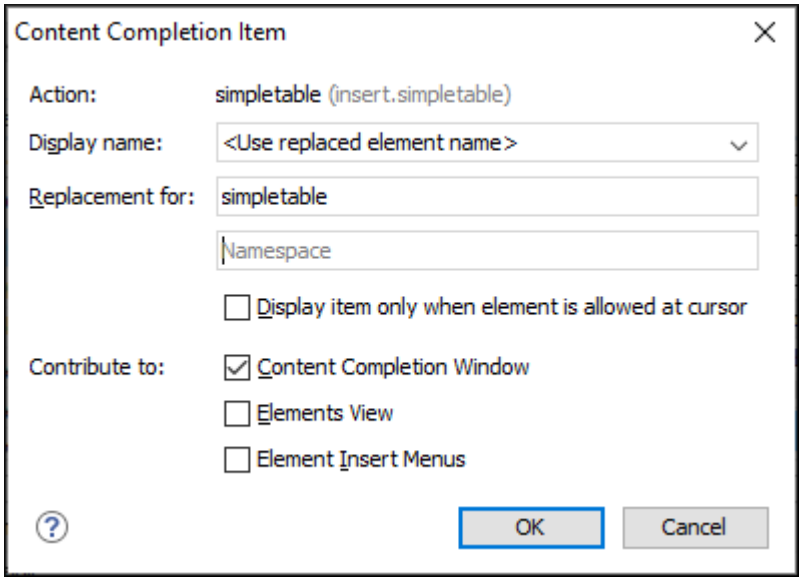
Available and Current Actions

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that the *Content Completion Assistant* proposes when you work with a document that belongs to the edited *framework*.

To add the selected available action as a sibling of the currently selected action in the **Current actions** section, use the **Add as sibling** button. To add it as a child of the currently selected action, use the **Add as child** button. To edit an existing action, select it and use the **Edit** button. To remove an existing action, use the **Remove** button. You can also move items up and down the list using the **Move Up** or **Move Down** buttons.

Adding an action (or editing an existing one) opens the **Content Completion Item** dialog box.

Figure 26. Content Completion Item Dialog Box



Use this dialog box to configure the action:

Action

Displays the name of the selected action.

Display name

You can use the drop-down menu to choose between displaying the action name or the replaced element name, or you can enter another name to be displayed.

Replacement for

Use this section to replace an existing element with the configured action:

- **Element name** and **Namespace** - The name (and namespace, if needed) of the replaced element. The original element no longer needs to be excluded using the **Filter - Remove content completion items** table *(on page 169)*.
- **Display item only when element is allowed at cursor** - The configured action is contributed in the UI components selected in the **Contribute to** section only if the associated schema allows the original element at the current location in the document. This is equivalent to defining activation XPaths in the **Author Action** dialog box *(on page 155)* using the `oxy:allows-child-element()` XPath extension function. Activation XPaths for the action are still checked when the action is invoked.

Contribute to

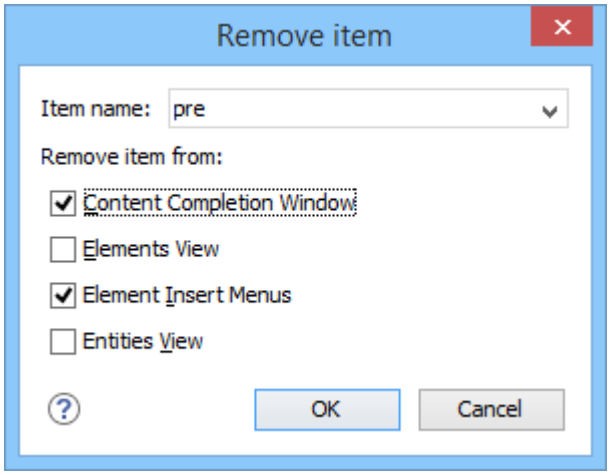
Use this section to specify where to display the configured item in the interface:

- **Content Completion Window** - The configured item will appear in the *Content Completion Assistant (on page 3418)*.
- **Elements View** - The configured item will appear in the **Elements** view.
- **Element Insert Menus** - The configured item will appear in the **Append Child**, **Insert Before**, or **Insert After** menus that are available in certain contextual menus (for example, the contextual menu of the **Outline** view).

Filter Table

The **Filter** section presents a table that allows you to add elements to be filtered from the *Content Completion Assistant* or from some specific helper views or menus. Use the **Add** button to add more filters to the table, the **Edit** button to modify an existing item in the table, or the **Remove** button to remove a filtered item. The **Add** and **Edit** buttons open a **Remove item** dialog box.

Figure 27. Remove Item Dialog Box



Use this dialog box to add or configure the elements that will be filtered:

Item name

Use this text field to enter the name of the element to be filtered. The drop-down list also includes a few special content completion actions that can be filtered:

- **<SPLIT> [elementName]** - Filters split entries for elements that have the form **Split elementName** or **New elementName**.
- **<SPLIT>** - Filters split entries for all elements.
- **<ENTER>** - Filters **Insert New Line** entries that appear in elements where whitespace is significant.

The filter list can be used to remove only content completion items contributed by the schema associated to the document and it does not remove actions added to the content completion

list via the framework configuration. The element name specified in the filter is not namespace aware, it matches the name of the element defined in the associated schema exactly as it would appear rendered in the content completion window.

> **Note:**
> If you try to insert an element in an invalid position (for example, using the content completion assistant), the editor will attempt to make the insertion valid. This may mean finding an alternate position for the insertion or splitting the element at the current position. If a **<SPLIT>** entry is added in the filter list for an element, the editor will never split that element.

Remove item from

You can choose to filter the element from any of the following:

- **Content Completion Window** - The element will not appear in the *Content Completion Assistant (on page 3418)*.
- **Elements View** - The element will not appear in the **Elements** view.
- **Element Insert Menus** - The element will not appear in the **Append Child**, **Insert Before**, or **Insert After** menus that are available in certain contextual menus (for example, the contextual menu of the **Outline** view).
- **Entities View** - The element will not appear in the **Entities** view *(on page 557)*.

Related information
Customizing the Content Completion Assistant Using a Configuration File *(on page 2309)*

Templates Tab

The **Templates** tab specifies a list of directories where new document templates are located for this particular framework. These directories, along with the document templates that are saved inside them, will appear in the **New Document** wizard *(on page 377)* inside the **Framework templates** category according to your framework and the directory path you specify in this tab.

To open the **Templates** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 145)*, and click on the **Templates** tab.

The **Templates** tab includes the following actions:

New

Opens a dialog box that allows you to specify the path to a directory that contains document templates for this framework. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.

> **Tip:**
> The path can also contain wildcards. For example, using `${frameworkDir}/templates/*` would add all the template folders found inside the `templates` directory.

Edit

Opens a dialog box that allows you to edit the path of a directory that contains document templates for this framework. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.

> **Tip:**
> The path can also contain wildcards. For example, using `${frameworkDir}/templates/*` would add all the template folders found inside the `templates` directory.

Delete

Deletes the currently selected template directory from the list.

Move Up

Moves the selected template directory up one spot in the list.

Move Down

Moves the selected template directory down one spot in the list.

Related information

Creating New Document Templates *(on page 385)*
Customizing Document Templates *(on page 387)*
Sharing Custom Document Templates *(on page 391)*

Catalogs Tab

The **Catalogs** tab specifies a list of *XML Catalogs*, specifically for the edited *framework (on page 3420)*, that are added to list of catalogs that Oxygen XML Editor uses to resolve resources.

To open the **Catalogs** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 145)*, and click on the **Catalogs** tab.

You can perform the following actions:

Add

Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.

Edit

Opens a dialog box that allows you to edit the path of an existing catalog.

Delete

Deletes the currently selected catalog from the list.

Move Up

Moves the selected catalog up one spot in the list.

Move Down

Moves the selected catalog down one spot in the list.

Transformation Tab

In the **Transformation** tab, you can configure the transformation scenarios associated with the particular *framework (on page 3420)* you are editing. These transformation scenarios are presented in the **Configure Transformation Scenarios** dialog box *(on page 1600)* when transforming a document and you can specify which scenarios will be used by default for a particular document type.

To open the **Transformation** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 145)*, and click on the **Transformation** tab.

The **Transformation** tab offers the following options:

Default checkbox

You can set one or more of the scenarios listed in this tab to be used as the default transformation scenario when another specific scenario is not specified. The scenarios that are set as default are rendered bold in the **Configure Transformation Scenarios** dialog box *(on page 1600)*.

New

Opens the **New scenario** dialog box allowing you to create a new transformation scenario for the particular document type *(on page 1504)*.

Duplicate

Allows you to duplicate the configuration of an existing transformation scenario. It opens the **Edit scenario** dialog box where you can configure the properties of the duplicated scenario *(on page 1599)*.

Edit

Opens the **Edit scenario** dialog box allowing you to edit the properties of the currently selected transformation scenario *(on page 1597)*.

Delete

Deletes the currently selected transformation scenario.

Import scenarios

Imports transformation scenarios.

Export selected scenarios

Export transformation scenarios.

Move Up

Moves the selection to the previous scenario.

Move Down

Moves the selection to the next scenario.

Validation Tab

In the **Validation** tab, you can configure the validation scenarios associated with the particular *framework (on page 3420)* you are editing. These validation scenarios are presented in the **Configure Validation Scenarios** dialog box when validating a document and you can specify which scenarios will be used by default for a particular document type.

Note:
If a *main file* is associated with the current file, the validation scenarios defined in the *main file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *main files*, see Contextual Project Operations Using 'Main Files' Support *(on page 428)* or Modular Contextual XML Editing Using 'Main Files' Support *(on page 841)*.

To open the **Validation** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 145)*, and click on the **Validation** tab.

The **Validation** tab offers the following options:

Default checkbox

You can set one or more of the scenarios listed in this tab to be used as the default validation scenario when another specific scenario is not specified in the validation process. The scenarios that are set as default are rendered bold in the **Configure Validation Scenarios** dialog box.

New

Opens the **New scenario** dialog box allowing you to create a new validation scenario.

Duplicate

Allows you to duplicate the configuration of an existing validation scenario. It opens the **Edit scenario** dialog box where you can configure the properties of the duplicated scenario.

Edit

Opens the **Edit scenario** dialog box allowing you to edit the properties of the currently selected validation scenario.

Delete

Deletes the currently selected validation scenario.

Import scenarios

Imports validation scenarios.

Export selected scenarios

Export validation scenarios.

Move Up

Moves the selected scenario up one spot in the list.

Move Down

Moves the selected scenario down one spot in the list.

Extensions Tab

The **Extensions** tab specifies implementations of Java interfaces used to provide advanced functionality to the document type.

To open the **Extensions** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 145)*, and click on the **Extensions** tab.

Libraries containing the implementations must be present in the *classpath (on page 152)* of your document type. The Javadoc available at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ contains details about how each API implementation functions.

Document Templates Preferences

Oxygen XML Editor provides a variety of built-in document templates that make it easier to create new documents in various formats. The list of available templates is presented in the **New Document** wizard *(on page 377)* when you create a new document (**New** toolbar button or **File > New**).

You can also create your own templates *(on page 385)* and share them with others. You can store your custom document templates in the existing `templates` folder in the Oxygen XML Editor installation directory or store them in a custom directory. If you store them in a custom directory, you need to use this **Document Templates** preferences page to add that directory to the list of template directories that Oxygen XML Editor makes available in the **New Document** wizard.

To add a template directory, follow these steps:

1. open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Document Templates**.
2. Use the **New** button to select a location of the new document template folder.
3. You can also use the **Edit** or **Delete** buttons to manage folders in the list, and you can alter the order that Oxygen XML Editor looks in these directories by using the **Up** and **Down** buttons.

Result: This will add the folder to the list in this preferences page and it will now appear in the **New Document** wizard *(on page 377)* in a category based upon the folder path you specified.

Note:
For DITA templates, they will also appear in the dialog box for creating new DITA topics from the **DITA Maps Manager**, but if you customize the template *(on page 387)*, you need to set the `type` property to **dita** in the corresponding properties file.

Encoding Preferences

Oxygen XML Editor lets you configure how character encodings are recognized when opening files and which encodings are used when saving files. To configure encoding options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Encoding**.

The following encoding options are available:

Fallback character encoding

Specifies the default character encoding of non-XML documents if their character encoding cannot be determined from other sources (for example, it is not specified in the document or determined by the file type).

Note:
For certain document types, the following encoding detection rules are used:

- For XML, DTD, and CSS documents, Oxygen XML Editor tries to collect the character encoding from the document. If no such encoding is found, then *UTF-8* is used.
- For JavaScript, JSON, SQL, XQuery, and RNC, the *UTF-8* encoding is used.

UTF-8 BOM handling

This setting specifies how to handle the *Byte Order Mark* (BOM) when Oxygen XML Editor saves a UTF-8 XML document:

- **Keep** (default) - Do not alter the BOM declaration of the currently open file.
- **Write** - Save the BOM bytes.
- **Don't Write** - Do not save the BOM bytes. Loaded BOM bytes are ignored.

> **Note:**
> The UTF-16 BOM is always preserved. UTF-32 documents have a *big-endian* byte order.

Encoding errors handling

This setting specifies how to handle characters that cannot be represented in the character encoding that is used when the document is opened. The available options are:

- **REPORT** (default) - Displays an error identifying the character that cannot be represented in the specified encoding. Unrecognized characters are rendered as an empty box.
- **REPLACE** - The character is replaced with a standard replacement character. For example, if the encoding is UTF-8, the replacement character has the Unicode code `FFFD`, and if the encoding is ASCII, the replacement character code is 63.
- **IGNORE** - The error is ignored and the character is not included in the document displayed in the editor.

> **Attention:**
> If you edit and save the document, the characters that cannot be represented in the specified encoding are dropped.

Encoding for Base64, Base32, Hex conversions

Specifies the encoding to be used when invoking the **Encode Selection** or **Decode Selection** actions for *Base64 (on page 579)*, *Base32 (on page 580)*, or *Hex* conversions *(on page 581)*. The default setting is *UTF8*.

Encode non-ASCII characters in URL paths

If selected (default), Oxygen XML Editor will escape non-ASCII characters (encode them with their hexadecimal equivalent) within URL paths. If you are using a non-Latin alphabet (such as Arab, Japanese, Chinese), it may be beneficial to deselect this option so that non-ASCII characters in URL paths will not be escaped and will remain more readable.

Editor Preferences

Oxygen XML Editor offers the possibility to configure the appearance of various components and features of the main editor. To access these options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor**.

The following options are available:

Selection background color

Allows you to set the background color of selected text.

Selection foreground color

Allows you to set the color of selected text.

Completion proposal background

Allows you to set the background color of the *Content Completion Assistant (on page 3418)*.

Completion proposal foreground

Allows you to set the color of the text in the *Content Completion Assistant (on page 3418)*.

Documentation window background

Allows you to set the background color of the documentation of elements suggested by the *Content Completion Assistant (on page 3418)*.

Documentation window foreground

Allows you to set the color of the text for the documentation of elements suggested by the *Content Completion Assistant (on page 3418)*.

Find highlight color

Allows you to set the color of the highlights generated by the **Find** and **Find all** actions.

XPath highlight color

Allows you to set the color of the highlights generated when you run an XPath expression.

Declaration highlight color

Allows you to set the color of the highlights generated by the **Find declaration** action.

Reference highlight color

Allows you to set the color of the highlights generated by the **Find reference** action.

Maximum number of highlights

Allows you to set the maximum number of highlights that Oxygen XML Editor displays.

Show TAB/NBSP/EOL/EOF marks

Makes the **TAB**/**NBSP**/**EOL**/**EOF** characters visible in the editor. You can use the color picker to choose the color of the marks.

Show SPACE marks

Makes the space character visible in the editor.

Can edit read-only files

If this option is selected, Oxygen XML Editor will let you edit read-only files. When you try to save them, a **Save As** dialog box will be displayed to avoid overwriting the initial resource. If the option is not selected, a warning message is displayed when you try to edit a read-only file.

Display quick-assist and quick-fix side hints

Displays the *Quick Assist (on page 3423)* icon ( ) and *Quick Fix (on page 3423)* icon ( ) in the line number stripe on the left side of the editor.

Undo history size

Allows you to set the maximum amount of undo operations you can perform in any of the editor modes (**Text**, **Author**, **Design**, **Grid**).

Enable mouse-wheel zooming

If selected, you can use **Ctrl + MouseWheelForward (Command + MouseWheelForward on macOS)** to increase the editor font (zoom in) or **Ctrl + MouseWheelBackwards (Command + MouseWheelBackwards on macOS)** to decrease the editor font (zoom out). It is enabled by default on Windows and Linux, while it is disabled by default on macOS, due to the way inertia affects the mouse wheel on this operating system.

Edit Modes Preferences

Oxygen XML Editor lets you configure which edit mode a file is opened in the first time it is opened. This setting only applies the first time a file is opened. The current editing mode of each file is saved when the file is closed and restored the next time it is opened. To configure the options for editing modes, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit Modes** .

Allow Document Type specific edit mode setting to override the general mode setting

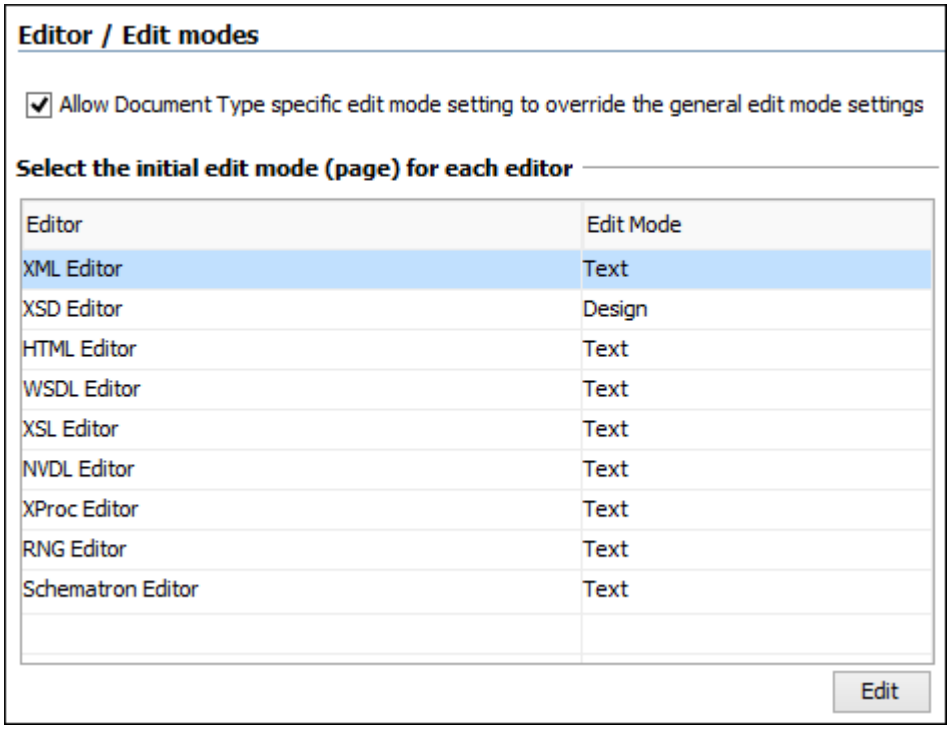
If selected, the initial edit mode setting set in the **Document Type** configuration dialog box *(on page 147)* overrides the general edit mode setting from the table below.

Select the initial edit mode (page) for each editor

This table specifies the default editing mode that will be opened for each type of document when the **Allow Document Type specific edit mode setting to override the general mode setting** option is not selected. Use the **Edit** button to change the initial edit mode for each type of document (editor). The initial edit mode can be one of the following:

- **Text**
- **Author**
- **Grid**
- **Design** (available only for the XSD editor).

Figure 28. Edit Modes Preferences Page



Text Preferences

Oxygen XML Editor allows you to configure how the **Text** mode editor appears. To configure these options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Text**.

The following options are available:

Editor background color

Sets the background color for the **Text** editing mode, **Outline** view, and some external tool editors (**Large File Viewer** *(on page 2839)*, **Compare Files** *(on page 484)*, **Compare Directories** *(on page 504)*).

Editor cursor color

Sets the color for the cursor in **Text** mode.

Highlight current line

If selected, the current line is highlighted with the foreground color specified with the color chooser.

Show line numbers

If selected (default value), line numbers are shown in the editor panels and in the **Output** view *(on page 2218)* of the debugger *perspectives (on page 3422)*. You can also specify the color for the line numbers using the color chooser. Printed output will also include the line numbers.

Show print margin

If selected, it allows you to set a safe print limit in the form of a vertical line displayed in the right side of the editor pane. You can also customize the print margin line color.

Print margin column

Allows you to specify a limit for the print width, measured in the number of characters.

Line wrap

If selected, long lines are automatically wrapped in edited documents. The line wrap does not alter the document content since the application does not use *new-line* characters to break long lines.

Cut / Copy whole line when nothing is selected

If selected, **Cut** and **Copy** actions operate on the entire current line when nothing is selected in the editor.

Enable folding

If selected (default value), the vertical stripe that holds the folding markers is displayed in **Text** mode.

XML section

Highlight matching tag

If selected, when you place the cursor on a start or end tag, Oxygen XML Editor highlights the corresponding member of the pair. You can also customize the highlight color.

Lock the XML tags

If selected, XML are locked and cannot be edited in **Text** mode.

JSON section

Show property name after ending bracket

If enabled (default), property names are displayed after the ending bracket when editing JSON documents in **Text** mode.

YAML section

Show SPACE marks for YAML only

If enabled (default), space characters are visible in the YAML editor.

Diagram Preferences

For certain XML languages, Oxygen XML Editor provides a diagram view as part of the **Text** mode editor. To configure the **Diagram** preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Text > Diagram**.

The following options are available in this preference page:

Show Full Model XML Schema diagram

When this option is selected, the **Text** mode editor for XML Schemas includes a split-screen view that shows a diagram of the schema structure. This is useful for seeing the effects of schema changes you make. For editing a schema using a diagram instead of text, use the schema **Design** view *(on page 364)*.

Note:
When handling very large schemas, displaying the schema diagram might affect the performance of your system. In such cases, disabling the schema diagram view improves the speed of navigation through the edited schema.

Enable Relax NG diagram and related views

Enables the Relax NG schema diagram and synchronization with the related views (**Attributes** *(on page 552)*, **Model** *(on page 555)*, **Elements** *(on page 556)*, **Outline** *(on page 1104)*).

Show Relax NG diagram

Displays the Relax NG schema diagram in the split-screen views (**Full Model View** *(on page 1097)* and **Logical Model View** *(on page 1098)*).

Enable NVDL diagram and related views

Enables the NVDL schema diagram and synchronization with the related views (**Attributes** *(on page 552)*, **Model** *(on page 555)*, **Elements** *(on page 556)*, **Outline** *(on page 1120)*).

Show NVDL diagram

Displays the NVDL schema diagram in the split-screen views (**Full Model View** *(on page 1116)* and **Logical Model View** *(on page 1117)*).

Location relative to editor

Allows you to specify the location of the schema diagram panel relative to the diagram **Text** editor.

Show/Hide Annotations link

Use this link to navigate to the **Schema Design** preferences page *(on page 206)* where you can choose to show or hide annotations in schema diagrams.

Zoom link

Use this link to navigate to the **Schema Design** preferences page *(on page 206)* where you can adjust the default zoom level of schema diagrams.

Grid Preferences

Oxygen XML Editor provides a **Grid** view *(on page 363)* of an XML document. To configure the **Grid** mode options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Grid**.

The following options are available:

Compact representation

If selected, the *compact representation* of the grid is used: a child element is displayed beside the parent element. In the *non-compact representation*, a child element is nested below the parent.

Format and indent when passing from grid to text or on save

If selected, the content of the document is formatted and indented each time you switch from the **Grid** view to the **Text** view.

Default column width (characters)

Sets the default width (in characters) of a table column of the grid. A column may contain the following:

- Element names
- Element text content
- Attribute names
- Attribute values

If the total width of the grid structure is too large you can resize any column by dragging the column margins with the mouse pointer, but the change is not persistent. To make it persistent, set the new column width with this option.

Active cell color

Allows you to set the background color for the *active cell (on page 3417)* of the grid. The keyboard input always goes to the *active cell* and the selection always contains it.

Selection color

Allows you to set the background color for the selected cells of the grid, except the *active cell (on page 3417)*.

Border color

Allows you to set the color used for the lines that separate the grid cells.

Background color

Allows you to set the background color of grid cells that are not selected.

Foreground color

Allows you to set the text color of the information displayed in the grid cells.

Row header colors

Background color

Allows you to set the background color of row headers that are not selected.

Active cell color

Allows you to set the background color of the row header cell that is currently active.

Selection color

Allows you to set the background color of the header cells corresponding to the currently selected rows.

Column header colors

The column headers are painted with two color gradients, one for the upper 1/3 part of the header and the other for the lower 2/3 part. The start and end colors of the first gradient are set with the first two color buttons. The start and end colors of the second gradient are set with the last two color buttons.

Background color

Allows you to set the background color of column headers that are not selected.

Active cell color

Allows you to set the background color of the column header cell that is currently active.

Selection color

Allows you to set the background color of the header cells corresponding to the currently selected columns.

Author Preferences

Oxygen XML Editor provides an **Author** editing mode that provides a configurable graphical interface for editing documents. To configure the options for the **Author** mode, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Author**.

The following options are available:

Author default background color

Sets the default background color of the **Author** editing mode. The `background-color` property set in the CSS file associated with the currently edited document overwrites this option.

Author default foreground color

Sets the default foreground color of the **Author** editing mode. The `color` property set in the CSS file associated with the currently edited document overwrites this option.

Show XML comments

When this option is selected, XML comments are displayed in **Author** mode. Otherwise, they are hidden.

Show placeholders for empty elements

When this option is selected, placeholders are displayed for elements with no content to make them clearly visible. The placeholder is rendered as a light gray box and displays the element name.

Show processing instructions

When this option is selected, XML processing instructions are displayed in **Author** mode. Otherwise, they are hidden.

Show Author layout messages

When this option is selected, all errors reported while rendering the document in **Author** mode are presented in the **Results** panel *(on page 558)* at the bottom of the editor.

Show doctype

When this option is selected, the **doctype** declaration is displayed in **Author** mode. Otherwise, it is hidden.

Show block range

When this option is selected, a *block range indicator* is displayed in a stripe located in the left side of the editor. It is displayed as a heavy line that spans from the first line to the last line of the block.

Fast text layout

In certain cases, the widths computed in the **Author** visual editing mode for lines of text may be larger than expected, leading to an incorrect visual layout. Deactivating this option will improve the computation quality for character widths in the visual editing mode, but it may hinder overall performance for very large documents.

Tip:
For macOS users, some specific examples of this type of situation can be found here: Text Rendering Issues on macOS *(on page 3060)*. Because of such problems, when an installation kit with Java 9 or newer is used on macOS, the checkbox is not selected by default.

Show floating contextual toolbar

When this option is selected (default), the *floating contextual toolbar* is displayed in the **Author** mode in certain situations. When not selected, the *floating contextual toolbar* is never displayed.

Images Section

The following options regarding images in **Author** mode are available in this section:

Auto-scale images wider than (pixels)

Sets the maximum width that an image will be displayed. Wider images will be scaled to fit.

Show very large images

When this option is selected, images larger than 6 megapixels are displayed in **Author** mode. Otherwise, they are not displayed.

Important:
If you select this option and your document contains many such images, Oxygen XML Editor may consume all available memory, throwing an **OutOfMemory error**. To resolve this, increase the available memory limit *(on page 348)* and restart the application.

Tags Section

In this section, you can configure the following options regarding tags that are displayed in **Author** mode:

Tags display mode

Sets the default display mode for element tags presented in **Author** mode. You can choose between the following:

Full Tags with Attributes

Displays full tag names with attributes for both *block (on page 3417)* and *inline elements (on page 3420)*.Oxygen XML Editor

Full Tags

Displays full tag names without attributes for both *block elements* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Block Tags without Element Names

Displays tags for *block elements* but without element names for a more compact version of **Block Tags** mode. You can still see the element names by hovering over the tags.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Sort attributes alphabetically for "Full Tags with Attributes"

When selected, if you choose **Full Tags with Attributes** for the **Tags Display Mode**, the attributes will be displayed in alphabetical order. Otherwise, they are displayed in the order that they appear in the XML source code.

Tags background color

Sets the **Author** mode tags background color.

Tags foreground color

Sets the **Author** mode tags foreground color.

Tags font

Allows you to change the font used to display tags text in the **Author** visual editing mode. The *default* font is computed based on the setting of the **Author default font** option in the **Fonts** preferences page *(on page 140)*.

Compact tag layout

If this option is not selected, the **Author** mode displays the tags in a more decompressed layout, where block tags are displayed on separate lines.

References Section

Display referenced content (external entities, XInclude, DITA conref, etc.)

When selected, the references (such as external entities, XInclude, DITA conrefs) also display the content of the resources they reference. When the option is not selected, the referenced resources are not automatically loaded and displayed, but the referenced content can be expanded on demand by using the small expansion button located next to each element that contains references. If you toggle this option while editing, you need to reload the file for the modification to take effect.

Allow referenced content to be edited

When selected, for a specific XML vocabulary that supports this feature, the content referenced from other files and presented in the **Author** visual editing mode can be edited in-place and saved. For now, if the feature is enabled and you use the **Open Map in Editor with Resolved Topics** toolbar action in the **DITA Maps Manager** view, the referenced content in the opened document becomes editable in-place. Saving the document will save all other modified topics.

Local files only

When selected (default), the **Allow referenced content to be edited (Experimental)** option only works for local files. For files located in remote locations such as a CMS, additional steps might be

necessary to save all modified content because this feature might not function properly with remote resources.

For advanced Author configuration see the Document Type Association settings

Click this link to open the **Document Type Association** preferences page *(on page 145)*.

Cursor Navigation Preferences

Oxygen XML Editor allows you to configure the appearance and behavior of the cursor in the **Author** mode editor. To set cursor navigation preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Author > Cursor Navigation**.

The following options are available:

Highlight elements near cursor

When this option is selected, the element that contains the cursor is highlighted. If the cursor is between two elements, both of them are highlighted. You can use the color picker to choose the color of the highlight.

Show cursor position tooltip

Oxygen XML Editor uses tooltips *(on page 606)* in **Author** mode to indicate the position of the cursor in the element structure of the underlying document. Depending on context, the tooltips may show the current element name or the names of the elements before and after the current cursor position.

Show location tooltip on mouse move

When this option is selected, Oxygen XML Editor displays *Location Tooltips (on page 608)* when you are editing the document in certain tags display modes (**Inline Tags**, **Partial Tags**, **No Tags**) or when the mouse pointer is moved between *block elements (on page 3417)*.

Quick up/down navigation

This option is deselected by default and this means that when you navigate using the up and down arrow keys in **Author** mode, the cursor is placed within each of the underlying XML elements between two blocks of text (the cursor changes to a horizontal line when it is between blocks of text). This allows you to easily insert elements and manage the structure of your XML content. However, if this option is selected, the cursor ignores the XML structure and jumps from one line of text to another, similar to how the cursor behaves in a word processor.

Quick navigation in tables

This option is selected by default and this means that when navigating between table cells with the arrow keys, the cursor jumps from one cell to another. If this option is not selected, the cursor navigates between XML nodes when navigating between table cells with the arrow keys.

Avoid positioning the cursor between blocks after a deletion

If selected (default), the cursor will not stay between block element sentinels after a deletion is performed.

Arrow keys move the cursor in the writing direction

This setting determines how the left and right arrow keys behave in **Author** mode for bidirectional (BIDI) text. When this option is selected (default value), the right arrow key advances the cursor in the reading direction and the left arrow moves it in the opposite direction. When this option is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

Schema-Aware Preferences

Oxygen XML Editor can use the schema of your XML language to improve the way the **Author** mode editor handles your content. To configure the **Schema-Aware** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Author > Schema-Aware**.

The following options are available:

Schema-aware normalization, format, and indent

When you open or save a document in **Author** mode, white space is normalized using the `display` property of the current CSS stylesheet and the values of the settings *(on page 213)* for **Preserve space elements**, **Default space elements**, and **Mixed content elements**. When this option is selected, the schema will also be used to normalize white space, based on the content model (*element-only*, *simple-content*, or *mixed*). Note that the schema information takes precedence.

Indent blocks-only content

To avoid accidentally introducing inappropriate white space around *inline elements (on page 3420)*, Oxygen XML Editor does not normally apply indenting to the source of an element with mixed content. If this option is selected, Oxygen XML Editor will apply indenting to the source of mixed content elements that only contain *block elements (on page 3417)*.

Schema-Aware Editing

The options in this section determine how Oxygen XML Editor will use the schema of a document to control the behavior of the **Author** mode.

- **On** - Enables all schema-aware editing options.
- **Off** - Disables all schema-aware editing options.
- **Custom** - Allows you to select custom schema-aware editing options from the following:

Schema-Aware Actions section

Delete element tags with backspace and delete

Controls what happens when you attempt to delete an element tag. The two options are:

- **Smart delete** - If deleting the tag would make the document invalid, Oxygen XML Editor will attempt to make the document valid by unwrapping the current element or by appending it to an adjacent element where the result would be valid. For instance, if you delete a bold tag, the content can be unwrapped and become part of the surrounding paragraph, but if you delete a list item tag, the list item content cannot become part of the list container. However, the content could be appended to a preceding list item.
- **Reject action when its result is invalid** - A deletion that would leave the document in an invalid state is rejected.

Paste and Drag and Drop

Controls the behavior for paste and drag and drop actions. Available options are:

- **Smart paste and drag and drop** - If the content inserted by a paste or drop action is not valid at the cursor position, according to the schema, Oxygen XML Editor tries to find an appropriate insert position. The possibilities include:
  - Creating a sibling element that can accept the content (for example, if you tried to paste a paragraph into an existing paragraph).
  - Inserting the content into a parent or child element (for example, if you tried to paste a list item into an existing list item, or into the space above or below and existing list).
  - Inserting the content into an ancestor element where it would be valid.
- **Reject action when its result is invalid** - If selected, Oxygen XML Editor will not let you paste content into a position where it would be invalid.

Typing

Controls the behavior that takes place when typing. Available options are:

- **Smart typing** - If typed characters are not allowed in the element at the cursor position, but the previous element does allow text, then a similar element will be inserted, along with your content.
- **Reject action when its result is invalid** - If selected, and the result of the typing action is invalid, the action will not be performed.

Content Completion

Controls the behavior that takes place when inserting elements using the *Content Completion Assistant* in **Author** mode. Available options are:

- **Press ENTER to show available content completion proposals** - If selected, pressing **Enter** will open the *Content Completion Assistant*. If deselected, there are three possibilities:
  - The current element will be split (if possible).
  - A new element with the same name will be inserted (if possible).
  - Otherwise, a new paragraph will be inserted.
- **Show all possible elements in the content completion list** - If selected, the content completion list will show all the elements in the schema, even those that cannot be entered validly at the current position. If you select an element that is not valid at the current position, Oxygen XML Editor will attempt to find a valid location to insert it and may present you with several options.
- **Allow only insertion of valid elements and attributes** - If selected, you can only select elements in the content completion list that are valid (according to the schema) at the current position.
- **Allow only insertion of valid attribute values** - If selected, you cannot enter an attribute value that is not valid (according to the schema) in the **Attributes** view *(on page 638)* or **In-place Attributes Editor** *(on page 619)*. If the attribute has a choice of values, you can select a possible value from a drop-down list in the combo box, but you cannot enter a value manually.

Warn on invalid content when performing action

A warning message will be displayed when performing an action that will result in invalid content. Available options are:

- **Delete Element Tags** - If selected, a warning message will be displayed if the Delete Element Tags *(on page 771)* action will result in an invalid document. You will be asked to confirm the deletion.
- **Join Elements** - If selected, a warning message will be displayed if the Join Elements *(on page 771)* action will result in an invalid document. You will be asked to confirm the join.

Automatically apply the best schema-aware insertion operation

If selected, Oxygen XML Editor automatically uses what it considers to be the best insertion solution, when there is an attempt to insert content that is not valid in a specific context. If not selected, Oxygen XML Editor will ask the user to choose from a list of proposed solutions.

Convert external content on paste

If selected, the *Smart Paste* feature *(on page 623)* is enabled when external content is pasted in **Author** mode.

Convert even when pasting inside space-preserve elements

If selected, the *Smart Paste* feature will be used even when external content is pasted inside a *space-preserve* element (such as a `<codeblock>`).

Convert pasted URLs to links

If selected, when a URL is pasted into **Author** mode, a link will be inserted (the type of link depends on the type of document). For example, in DITA documents, an `<xref>` is inserted.

Review Preferences

Oxygen XML Editor allows you to add review comments and track changes *(on page 652)* in your documents. The **Review** preferences page allows you to control how the Oxygen XML Editor review features work. To configure these options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Author > Review**.

The available options are as follows:

Author

Specifies the name to be attached to all comments and to changes made while **Track Changes** is active. By default, Oxygen XML Editor uses the system user name.

Track Changes section (applies for all authors)

Initial state

Specifies whether or not the *Track Changes* feature *(on page 3424)* is enabled when you open a document. You may have the *Track Changes* feature enabled in some documents and disabled in others, or you can choose to always enable or disable the feature for all documents. You can choose between the following options:

- **Stored in document** - The current state of the *Track Changes* feature is stored in the document itself, meaning that it is on or off depending on the state the last time the document was saved. This is the recommended setting when multiple authors work on the same set of documents as it will make it obvious to other authors that changes have been made in the document.

- **Always On** - The *Track Changes* feature is always on when you open a document. You can turn it off for an open document, but it will be turned on for the next document you open.
- **Always Off** - The *Track Changes* feature is always off when you open a document. You can turn it on for an open document, but it will be turned off for the next document you open.

Initial display mode

Specifies whether or not all tracked changes and comments are visible when you open a document in the **Author** visual editing mode. You can choose between the following options:

- **View All Changes/Comments** - All tracked changes and comments are visible in the **Author** visual editing mode.
- **View Final** - Comments are hidden, while insertion and deletion track changes are presented as if they would be accepted.

Display changed lines marker

A changed line maker is a vertical line on the left side of the editor window indicating where changes have been made in the document. To hide the changed lines marker, deselect this option.

Inserted content color

When the *Track Changes* feature *(on page 3424)* is on, the newly inserted content is highlighted with an *insertion marker* that uses a color to adjust the following display properties of the inserted content: *foreground*, *background*, and *underline*. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Editor automatically assigns a color to each user who inserted content in the current document. The colors are picked from the **Colors for automatic assignment** list *(on page 193)*, the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Editor uses the specified color for all insertion markers, regardless of who the author is.
- **Use same color for text foreground** - If selected, Oxygen XML Editor uses the color defined above (**Automatic** or **Fixed**) to render the foreground of the inserted content.
- **Use same color for background** - If selected, Oxygen XML Editor uses the color defined above (**Automatic** or **Fixed**) to render the background of the inserted content. A slider control allows you to set the transparency level of the background.

Deleted content color

When the *Track Changes* feature *(on page 3424)* is on, the deleted content is highlighted with a *deletion marker* that uses a color to adjust the following display properties of the deleted content: *foreground*, *background*, and *strikethrough*. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Editor automatically assigns a color to each user who deleted content in the current document. The colors are picked from the **Colors for automatic assignment** list *(on page 193)*, the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Editor uses the specified color for all deletion markers, regardless of who the author is.
- **Use same color for text foreground** - If selected, Oxygen XML Editor uses the color defined above (**Automatic** or **Fixed**) to render the foreground of the deleted content.
- **Use same color for background** - If selected, Oxygen XML Editor uses the color defined above (**Automatic** or **Fixed**) to render the background of the deleted content. A slider control allows you to set the transparency level of the background.

Comments color section (applies for all authors)

Sets the background color of the text that is commented on. The options are:

- **Automatic** - If this option is selected, Oxygen XML Editor automatically assigns a color to each user who adds a comment in the current document. The colors are picked from the **Colors for automatic assignment** list *(on page 193)*, the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Editor uses the specified color for all changes, regardless of who the author is. A slider control allows you to set the transparency level of the background.

Colors for automatic assignment list

These are the colors that will be automatically assigned for tracked insertions, tracked deletions, and comments if the **Automatic** option is selected in any of the sections in this preferences page. The colors are assigned in the order that you see in this list. You can use the **Add**, **Edit**, or **Remove** buttons to modify the list of colors.

Related information

Reviewing Documents *(on page 652)*

Callouts Preferences

Oxygen XML Editor can display *callouts (on page 3418)* for review items such as comments and *tracked changes (on page 652)*. To customize options for review callouts, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Author > Review > Callouts**.

The available options are as follows:

Show Review Callouts section

Comments

If selected, callouts are displayed for comments, including comments that are added to *tracked changes (on page 3424)*. This option is selected by default.

Track Changes deletions

If selected, callouts are displayed for *tracked change (on page 3424)* deletions and the following additional option becomes available:

Show deleted content in callout

If selected, the deleted content is also displayed in the callout.

Track Changes insertions

If selected, callouts are displayed for *tracked change (on page 3424)* insertions and the following additional option becomes available:

Show inserted content in callout

If selected, the inserted content is also displayed in the callout.

Rendering section

Show review time

When selected, timestamp information is displayed in callouts.

Show all connecting lines

When selected, lines are shown that connect the callout to the location of the change.

Initial width (px)

Specifies the initial width of the callouts each time the document is opened. The default is 250 pixels.

Text lines count limit

Specifies the maximum number of lines to be shown in the callouts. The default is 5 lines. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it. To see the

full comment, right-click on the callout and select **Edit Comment** or **Show Comment**.

Profiling/Conditional Text Preferences

Oxygen XML Editor lets you configure how profiling and conditional text *(on page 680)* is displayed in **Author** mode. It has built-in support for the standard conditional text features of DITA and DocBook that you can customize for your own projects. You can also add conditional support for other XML vocabularies, including your custom vocabularies.

To configure **Profiling/Conditional Text** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Author > Profiling/Conditional Text**. There are several sub-pages in this section. This first parent page includes options for determining which types of profiled content is displayed:

Show profiling attributes

Toggles whether or not the **Show Profiling Attributes** option *(on page 691)* in the **Profiling / Conditional Text** drop-down menu is enabled by default.

Show profiling attribute name

If selected, the names of the profiling attributes are displayed with their values. If unchecked, only the values are displayed.

Show profiling colors and styles

Toggles whether or not the **Show Profiling Colors and Styles** option *(on page 691)* in the **Profiling / Conditional Text** drop-down menu is enabled by default.

Show excluded content

Toggles whether or not the **Show Excluded Content** option *(on page 691)* in the **Profiling / Conditional Text** drop-down menu is enabled by default.

Attributes and Condition Sets Preferences

To configure profiling attributes and condition sets, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Attributes and Condition Sets**.

Note:
Note the following when configuring these settings:

- This preferences page is used to define how profiled elements are treated in **Author** mode. It does not create profiling or conditional text attributes or values in the underlying XML vocabulary. It just changes how the editor displays them.
- This preferences page should be used for profiling / conditional text elements only. To change how other types of attributes are displayed in the text, use a CSS file.
- If you are using the DITA XML vocabulary and a DITA *subject scheme map (on page 3424)* is defined in the *root map (on page 3424)* of your document, it will be used in place of anything defined using this dialog box.

This preferences page contains the following options and sections:

Import from DITAVAL

This button allows you to import profiling attributes from DITAVAL files *(on page 3342)*. You can merge these new profiling attributes with the existing ones, or replace them completely. If the imported attributes conflict with the existing ones, Oxygen XML Editor displays a dialog box that contains two tables. The first one previews the imported attributes and the second one previews the already defined attributes. You can choose to either keep the existing attributes or replace them with the imported ones.

Note:
When importing profiling attributes from DITAVAL files, Oxygen XML Editor automatically creates condition sets based on these files.

Profiling Attributes section

Allows you to specify a set of allowable values for each profiling or conditional attribute. You can use the **New** button at the bottom of the table to add profiling attributes *(on page 681)*, the **Edit** button to edit existing ones, or the **Delete** button to delete entries from the table. Use the **Up** and **Down** buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Editor uses the one that is positioned highest in the table.

Report invalid profiling attribute values (DITA only)

If selected, it means the following:

- In DITA, the automatic validation will display a warning when a value that is not defined is found in the document.
- In the DITA **Validate and Check for Completeness** dialog box, the Report attributes and values that conflict with profiling preferences *(on page 3123)* option is not displayed. This means that the validation will behave the same as if that option was selected and it will always report such values.

Allow contributing extra profiling attribute values

This option is selected by default, which means that users are allowed to add values that are not defined in preferences to profiling attributes. If a user inserts such a value, when invoking the **Edit Profiling Attributes** action from the contextual menu in **Author** mode (or for DITA topics, the **Edit Properties** action in the **DITA Maps Manager** *(on page 3073)*), the **Profiling Values Conflict** dialog box *(on page 683)* will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. If deselected, Oxygen XML Editor behaves as if the **Preserve the configuration** option has been chosen in the **Profiling Values Conflict** dialog box *(on page 683)* and that dialog box will never appear.

Configure profiling colors and styles link

Use this link to open the profiling **Colors and Styles** preference page *(on page 197)*.

Profiling Condition Sets section

Allows you to specify a specific set of profiling attributes to be used to specify a particular build configuration for your content. You can use the **New** button at the bottom of the table to add condition sets *(on page 686)*, the **Edit** button to edit existing ones, or the **Delete** button to delete entries from the table. Use the **Up** and **Down** buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Editor uses the one that is positioned highest in the table.

Styling the Rendering of Profiled Content Using a DITAVAL File *(on page 3344)*

Colors and Styles Preferences

Oxygen XML Editor lets you set the colors and styles used to display profiling / conditional text *(on page 195)* in the **Author** mode editor *(on page 363)*. To set Colors and Styles preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Author > Profiling/ Conditional Text > Colors and Styles**.

The preference page includes the following options and sections:

Automatically apply colors and styles from DITAVAL files referenced in the Main Files folder

If this setting is enabled (default state is disabled) and **DITAVAL** filter files that define flagging conditions are referenced within the **Main Files** folder in the **Project** view, those conditions are automatically taken into account when the **Show Profiling Colors and Styles** option *(on page 691)* from the **Profiling / Conditional Text** toolbar drop-down menu in **Author** mode is enabled.

Import from DITAVAL

Allows you to import profiling styles from a `.ditaval` file. You can merge these new profiling styles with the existing ones, or replace them completely. If the imported styles conflict with the existing ones, Oxygen XML Editor displays a dialog box containing two tables. The first one previews the imported styles, while the second one previews the already defined styles. You can choose to either keep the existing styles or replace them with the imported ones. This feature works even if you use profiling attribute groups to organize the attributes into subcategories *(on page 3335)*.

Profiling Colors and Styles Table

You can use buttons below this table to set specific colors and styles for the listed profiling attribute values. The table includes two categories:

- **Defined attributes values** - Contains the styles for profiling attribute values defined in the **Profiling / Conditional Text** *(on page 195)* preferences page. Each profiling attribute value has an associated style. To ease the process of customizing styles, the **Defined attributes values** category contains by default the list of empty styles. All you have to do is to adjust the colors and decorations, thus skipping the process of manually defining the association rules (document type, attribute name, and value). This is the reason why a style from this category can only be reset *(on page 199)*, not deleted.
- **Other** - This category contains styles for attribute values that are not marked as profiling values, in the **Profiling / Conditional Text** *(on page 195)* preferences page. In this category are listed:
  - All the styles that were defined in other projects (with other profiling attribute value sets).
  - All the styles set for the profiling attributes defined in a *subject scheme map (on page 3337)*.

Automatic styling button

If you click this button, Oxygen XML Editor will apply automatic styling to the profiling attribute values that do not have a style defined.

New button

Opens the **Add Profiling Style** dialog box that allows you to associate a set of coloring and styling properties to a profiling value.

Note:
You can define a default style for a specific attribute by setting the **Attribute value** field to `<ANY>`. This style is applied for attribute values that do not have a specific style associated with it.

Edit button

Open the **Edit Profiling Style** dialog box that allows you to edit the colors or style for an existing profiling value. You can also double-click the value to open this dialog box.

Clear style button

Resets the style for the selected value to its default setting (no color or decoration).

Delete button

Delete the selected style from the **Other** category.

Related information

Filtering Profiling Values with a DITAVAL File *(on page 3342)*
Styling the Rendering of Profiled Content Using a DITAVAL File *(on page 3344)*

Attributes Preferences

When the **Show Profiling Attributes** option *(on page 691)* is selected, the **Author** mode displays conditional text markers at the end of conditional text blocks. To configure the rendering of these text markers, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles > Attributes**.

The following options are available:

Background color

Sets the background color used to display the profiling attributes.

Attribute name foreground color

Sets the foreground color used to display the names of the profiling attributes.

Attribute values foreground color

Sets the foreground color used to display values of the profiling attributes.

Border color

Sets the color of the border of the block that displays the profiling attributes.

MathML Preferences

Oxygen XML Editor allows you to edit *MathML (on page 760)* equations and displays the results in a preview window. For a more advanced *MathML* editor, you can either install Wiris *MathType (on page 762)* (which is a commercial product that requires a separate license) or use an external *MathML* editor (e.g. the *LibreOffice* equation editor).

Using *MathFlow* for Editing and Rendering MathML Equations (Deprecated)

Important:
The *MathFlow* editor integration has been marked as deprecated and was replaced with a new *MathType* integration *(on page 761)*.

To configure the *MathML* editor or to enter your *MathFlow* license information, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Author > MathML**.

You can configure the following options:

Equation minimum font size

The minimum size of the font used for rendering mathematical symbols when editing in the **Author** mode.

MathFlow installation directory

The installation folder for the *MathFlow* components product (*MathFlow* SDK).

MathFlow license file

The license file for the *MathFlow* components product (*MathFlow* SDK).

MathFlow preferred editor

A *MathML* formula can be edited in one of three editors of *MathFlow* components product (*MathFlow* SDK).

- **Structure Editor** (default selection) - Targets professional XML workflow users.
- **Style Editor** - Tailored to the needs of content authors.
- **Simple Editor** - Designed for applications where end-users can enter mathematical equations without prior training and only the meaning of the math matters.

Save special characters

Specifies how special characters are saved in the XML file.

- **As entity names** - Saves the characters in `&name;` format. It refers to a character by the name of the entity that has the desired character as its replacement text. For example, the Greek *Omega* character is saved as `&Omega;`.
- **As character entities** (default selection) - Saves the characters in a hexadecimal value, using the `&#xNNN` format. For example, the Greek *Omega* character is saved as `&#x3a9;`.
- **As character values** - Saves the characters as the actual symbol. For example, the Greek *Omega* character is saved as `Ω`.

More documentation is available on the Wiris *MathFlow* website.

Using an External Tool for Editing MathML Equations

External application > Command line

You can use this option to specify an external MathML application for editing MathML equations.

For example, the following commands could be used to edit MathML equations with a LibreOffice application (depending on the O.S.):

- **Windows** - `"C:\Program Files\LibreOffice\program\smath.exe" --nologo "${cf}"`
- **macOS** - `/Applications/LibreOffice.app/Contents/MacOS/soffice --math --nologo "${cf}"`
- **Linux** - `/usr/lib/libreoffice/program/smath --nologo "${cf}"`

AutoCorrect Preferences

Oxygen XML Editor includes an option to automatically correct misspelled words as you type in **Author** mode. To enable and configure this *AutoCorrect* feature *(on page 470)*, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit Modes > Author > AutoCorrect**.

The following options are available:

Enable AutoCorrect

When selected (default state), while editing in **Author** mode, if you type anything that is listed in the **Replace** column of the Replacements table displayed in this preferences page, Oxygen XML Editor will automatically replace it with the value listed in the **With** column.

Use additional suggestions from the spell checker

If selected, in addition to anything listed in the Replacements table displayed in this preferences page, Oxygen XML Editor will also use suggestions from the Spell Checker to automatically correct misspelled words. Suggestions from the Spell Checker will only be used if the misspelled word is not found in the Replacements table.

Note:
The *AutoCorrect* feature shares the same options configured in the **Language options** *(on page 239)* and **Ignore elements** *(on page 240)* sections in the **Spell Check** preferences page.

Include text-to-markup corrections based on the current document type

If selected, in addition to anything listed in the Replacements table displayed in this preferences page, the *AutoCorrect* mechanism will also include XML markup insertion rules specified in a configuration file for each document type. For example, for default DITA, DocBook, and TEI documents, entering a hyphen (-) followed by a space in an empty paragraph will automatically insert a list element with an empty list item element inside. The configuration file is located at: *[OXYGEN_INSTALL_DIR]*`/frameworks/[DOC_TYPE]/resources/structureAutocorrect.xml`.

Tip:
By default, the `structureAutocorrect.xml` file only exists for DITA, DocBook, and TEI frameworks, but it is possible to customize your own

markup correction rules for your particular document type. For details, see Customizing Text-to-Markup Shortcut Patterns *(on page 2305)*.

Spell Check options link

Use this link to navigate to the Spell Check Preferences page *(on page 238)*.

Replacements Table section

The *AutoCorrect* feature uses the Replacements table to automatically replace anything that is listed in the **Replace** column with the value listed in the **With** column for each language.

Replacements for language drop-down menu

You can specify the language for the Replacements table, and for each language, you can configure the items listed in the table. The language selected in this page is not the language that will be used by the *AutoCorrect* feature. It is simply the language for the Replacements table.

Replacements Table

You can double-click on cells in either column to edit the listed items. Use the **Add** button to insert new items and the **Remove** button to delete rows from the table.

Note:
Any changes, additions, or deletions you make to this table are saved to a path that is specified in the **AutoCorrect Dictionaries** preferences page *(on page 204)*.

Smart quotes section

You can also choose to automatically convert double and single quotes to a quotation character of your choice by using the following options in the **Smart quotes** section:

- **Replace "Single quotes"** - Replaces single quotes with the quotation symbols you select with the **Start quote** and **End quote** buttons.
- **Replace "Double quotes"** - Replaces double quotes with the quotation symbols you select with the **Start quote** and **End quote** buttons.

Note:
These **Smart quotes** options are ignored for content inside any element listed in the **Ignore elements** section of the **Spell Check preferences page** *(on page 240)*.

Global Options *(on page 3420)*

If this option is selected, the options are stored on your local computer, in a folder that is not accessible to other users.

Project Options *(on page 3423)*

If this option is selected, the options are stored in the project file and can be shared with other users. Selecting **Project Options** *(on page 3423)* will only save your selections in **Enable AutoCorrect** *(on page 201)*, **Use additional suggestions from the spell checker** *(on page 201)*, and the options in the **Smart quotes** section *(on page 202)*. Changes to the Replacements table are not saved in this page. To save changes to the Replacements table at project level you need to specify a custom location in the **User-defined replacements** section of the **AutoCorrect Dictionaries** preferences page *(on page 204)* and select **Project Options** from that preferences page instead.

Restore Defaults

Restores the options in this preferences page to their default values and **also deletes any changes you have made to the Replacements table *(on page 202)***.

AutoCorrect Dictionaries Preferences

To set the Dictionaries preferences for the *AutoCorrect* feature *(on page 470)*, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit Modes > Author > AutoCorrect > Dictionaries**. This page allows you to specify the location of the dictionaries that Oxygen XML Editor uses for the *AutoCorrect* feature and the location for saving user-defined replacements.

The following options are available in this preferences page:

Dictionaries default folder

Displays the default location where the dictionaries that Oxygen XML Editor uses for the *AutoCorrect* feature are stored.

Include dictionaries from

Selecting this option allows you to specify a location where you have stored *AutoCorrect* dictionaries that you want to include, along with the default ones.

Important:
Consider the following notes regarding this option:

- The *AutoCorrect* mechanism takes into account *AutoCorrect* dictionaries collected both from the default and custom locations and multiple dictionaries from the same language are merged (for example, `en_UK.dat` from the default location is merged with `en_US.dat` from a custom location).
- If you have a generic *AutoCorrect* dictionary file (one that just has a two-letter language code for its file name, such as `en.dat`) saved in either the default or custom location, the other more specific dictionaries (for example, `en_UK.dat` and `en_US.dat`) will not be merged and the existing generic dictionary will simply be used instead.

- You can use a custom suffix in the dictionary file name after the language code. For example, `en_US_synopsys.dat` or `en_synopsys.dat`.
- If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

How to add more dictionaries link

Use this link to open a topic in the Oxygen XML Editor User Guide that explains how to add dictionaries for the *AutoCorrect* feature *(on page 471)*.

Save user-defined replacements in the following location

Specifies the target where added, edited, or deleted replacements are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Tip:
To save changes to the Replacement table (in the **AutoCorrect** preferences page) *(on page 202)* at project level *(on page 3423)*, select a custom location for the **User-defined replacements** and select **Project Options** *(on page 3423)* at the bottom of the page.

Related information
Add Dictionaries for the AutoCorrect Feature *(on page 471)*

Serialization Preferences

To configure the serialization options for the **Author** mode, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Author > Serialization**.

The following options are available:

Format and indent

Use this option to specify what should be formatted and indented when you save a document (or switch from **Author** to **Text** mode). You can choose between the following two options:

Only the modified content

The **Save** operation only formats the nodes that were modified in the **Author** mode. The rest of the document preserves its original formatting.

Note:
This option also applies to the *DITA maps* opened in the **DITA Maps Manager** *(on page 3073)*.

The entire document

The **Save** operation applies the formatting to the entire document regardless of the nodes that were modified in **Author** mode.

Also apply the format and indent options that are set for Text mode

If this option is selected, the result of the **Format and indent** operation will be the same as when it is applied in **Text** editing mode. Thus, the content of the document is formatted by applying the **Format and Indent** rules from the **Editor/Format** *(on page 210)* and **Editor/Format/XML** *(on page 213)* preference pages. You can use the **Format and indent options** link to navigate to those options.

Compatibility with other tools

Use this option to control how line breaks are handled when a document is serialized. This will help to obtain better compatibility with other tools. You can choose one of the following:

- **None** - Choose this option if compatibility with other tools can be ignored.
- **Do not break lines, do not indent** - Choose this option to avoid breaking lines after element start or end tags and indenting will not be used.

Note:
New lines that are added by the user in elements where the `@xml:space` attribute is set to `preserve` (such as `<pre>` elements in HTML, or `<codeblock>` elements in DITA) are still inserted. Also, selecting this option automatically disables the **Also apply the format and indent options that are set for Text mode** option *(on page 205)*, since the formatting from **Text** mode does not take the CSS styles into account.

- **Break lines only after elements displayed as blocks, do not indent** - Choose this option to instruct Oxygen XML Editor to insert new lines only after elements that have a CSS display property set to anything other than `inline` or `none` (for example, `block`, `list-item`, `table`, etc.) and indenting will not be used. When selecting this option, the formatting is dictated by the CSS.

Note:
New lines that are added by the user in elements where the `@xml:space` attribute is set to `preserve` (such as `<pre>` elements in HTML, or `<codeblock>` elements in DITA) are still inserted. Also, selecting this option automatically disables the **Also apply the format and indent options that are set for Text mode** option *(on page 205)*, since the formatting from **Text** mode does not take the CSS styles into account.

Schema Design Preferences

Oxygen XML Editor provides a graphical schema design editor *(on page 364)* to make editing XML Schema easier. To configure the **Schema Design** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Schema Design**.

The following options are available in the **Schema Design** preferences page:

Show annotation in the diagram

When selected, Oxygen XML Editor displays the content of documentation in schema diagrams.

When trying to edit components from another schema

The schema diagram editor will combine schemas imported by the current schema file into a single schema diagram. You can choose what happens if you try to edit a component from an imported schema. The options are:

- **Always go to its definition** - Oxygen XML Editor opens the imported schema file so that you can edit it.
- **Never go to its definition** - The imported schema file is not opened and the component cannot be edited in place.
- **Always ask** - Oxygen XML Editor asks if you want to open the imported schema file.

Zoom

Allows you to set the default zoom level of the schema diagram.

XSD Properties Preferences

Oxygen XML Editor lets you control which properties to display for XML Schema components in the XML Schema **Design** view *(on page 364)*. To configure the schema design properties displayed, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Schema Design > XSD Properties**.

This preferences page contains the following:

Show additional properties in the diagram

If this option is selected, the properties selected in the property table are shown in the XML Schema **Design** mode. This option is selected by default.

Properties Table

Show

Use this column in the table to select the properties that you want to be displayed in the XML Schema **Design** mode.

Only if specified

Use this column to select if you want the property to be displayed only if it is defined in the schema.

JSON Schema Properties Preferences

Oxygen XML Editor lets you control which properties to display for JSON Schema components in the JSON Schema **Design** mode. To configure the JSON properties that are displayed, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Schema Design > JSON Schema Properties**.

This preferences page contains the following:

Show additional properties in the diagram

If this option is selected, the properties selected in the property table are shown in the JSON Schema **Design** mode. This option is selected by default.

Properties Table

Show

Use this column in the table to select the properties that you want to be displayed in the JSON Schema **Design** mode.

Only if specified

Use this column to select if you want the property to be displayed only if it is defined in the schema.

Open Preferences

Oxygen XML Editor lets you control how files are opened. To configure the options for opening documents, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Open**.

The following options are available:

Open each document in a tab next to the current one

When selected (default), each new document is opened in a tab next to the currently open tab. If not selected, each new document is opened in a tab at the end of the current tab stack.

Restore cursor position

Selected by default, it ensures that the last position of the cursor will be remembered when a document is re-opened. If this option is not selected, the cursor will always be positioned at the beginning of the document.

Lock local resources

When this option is selected and you open a file from the local file system or a shared network drive, Oxygen XML Editor locks the file for the current user and the file becomes read-only for other users while the lock exists. Locked and read-only files have a lock icon () displayed on their editor tabs. Newly created files are *locked* when you first save them. If you select this option with files already opened in Oxygen XML Editor, it will *lock* all the currently open files. If you deselect this option with files already opened, it will unlock them by deleting the

corresponding `.lock` files. When you try to save locked (read-only) files, a **Save As** dialog box will be displayed to avoid overwriting the initial resource.

Support for Special Characters section

Note:
The options in this section only affect the **Text** editing mode.

When bidirectional text, Asian languages, or other special characters are detected

You can choose how you want Oxygen XML Editor to handle bidirectional text, Asian languages, or other special characters when they are detected in **Text** mode. You can choose one of the following:

- **Enable support for special characters** - The support for special characters will always be enabled. For details about what this means, see Bidirectional Text Support in Text Mode - Enabled *(on page 574)*.
- **Disable support for special characters** - The support for special characters will always be disabled. For details about what this means, see Bidirectional Text Support in Text Mode - Disabled *(on page 574)*.
- **Prompt for each document** (default setting) - You will be prompted to choose whether or not to enable the support for special characters whenever they are detected in a newly opened document. For details about which setting to choose, see Special Character Support in Text Mode *(on page 574)*.

Disable special characters support for documents larger than (characters)

Enabling bidirectional text editing support can affect performance on large files. When this option is selected, bidirectional editing is disabled for files exceeding the specified size (even if the **Enable support for special characters** option *(on page 208)* is selected). The default limit is 300 MB. You can change it to 500 MB or 800 MB, but it is recommended that you always leave this option selected regardless of the limit that is set.

Performance section

Optimize loading in the Text edit mode for files over (MB)

File loading is optimized for reduced memory usage for any file whose size is larger than the value specified in this drop-down list. This is useful for editing large files, but there are several restrictions *(on page 479)* for memory-intensive operations.

Show warning when loading large documents

Oxygen XML Editor will warn you if you open a file that is bigger than the specified size.

Optimize loading for documents with lines longer than (Characters)

Line wrap is automatically performed for documents that contain lines that exceed the length specified in this text field. For a list of the restrictions applied to a document with long lines, see Editing Documents with Long Lines *(on page 481)*.

Show warning when loading documents with long lines

When selected, Oxygen XML Editorwill warn you when you open a file with lines longer than the specified length. To reduce the length of lines in a file, format and indent the document after it is opened in the editor panel. For a list of the restrictions applied to a document with long lines, see Documents with Long Lines *(on page 481)*.

Save Preferences

Oxygen XML Editor lets you control how files are saved. To configure the options for saving documents, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Save**.

The following options are available:

Show "Save as" option to save newly created documents in the "New" document wizard

It is selected by default, but if you deselect this option, the **Save as** option *(on page 379)* will not be available in the **New Document** wizard *(on page 377)*, so you will not have the ability to change the default name and path of the new file.

Safe save (only for local files)

In the unlikely event of a failure when attempting a **Save** action, this option provides increased protection from corruption of the original file. When this option is selected, it saves the content to a temporary file and if the save is unsuccessful, the editor preserves its unsaved state status.

Automatically save the document every

If selected, your documents are automatically saved after a preset time interval that is specified in the drop-down list.

On Save, make backup copy with extension (only for local files)

If selected, a backup copy is made when saving the edited document. This option is available only for local files (files that are stored on the local file system). The default backup file extension is `.bak`, but that can be changed in the text field.

Save auto-recover information every

If selected, your documents are automatically saved to a backup file after the time interval specified in the drop-down list.

Auto-recover file location

Specifies the location of the backup file for auto-recovery.

Validate document before saving

If selected, Oxygen XML Editor runs a validation that checks your document for errors before saving it.

Save all files before transformation or validation

Saves all opened files before validating or transforming an XML document. This ensures that any dependencies are resolved when modifying the XML document and its XML Schema.

Save all files before calling external tools

If selected, all files are saved before executing an external tool.

Automatically compile LESS to CSS when saving

If selected, when you save a LESS file it will automatically be compiled to CSS (deselected by default).

Important:
If this option is selected, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

Performance section

Clear undo buffer on save

If selected, Oxygen XML Editor clears its undo buffer when you save a document. Thus, modifications made prior to saving the document cannot be undone. Select this option if you frequently encounter **out of memory** errors when editing large documents.

Format Preferences

This preferences page contains various formatting options that influence editing and formatting in both the **Text** *(on page 362)* and **Author** *(on page 363)* editing modes. To control additional options specifically for the **Author** mode editor, see Whitespace Handling in Author Mode *(on page 608)*.

Note:
These settings apply to the formatting of source documents. The formatting of output documents is determined by the transformation scenarios that create them *(on page 1470)*.

To configure the **Format** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Format**.

The following options are available:

Detect indent on open

If selected, Oxygen XML Editor detects how a document is indented when it is opened. Oxygen XML Editor uses a heuristic method of detection by computing a weighted average indent value from the initial document content. You can deselect this setting if the detected value does not work for your particular case and you want to use a fixed-size indent for all the edited documents. If this option is selected, Oxygen XML Editor detects the following:

- When TAB characters are used to indent content, the size of the TAB characters is used for the indent size.
- Otherwise, the detected size of SPACE characters is used for the indent size.

Tip:
If you want to minimize the formatting differences created by the **Format and Indent** operation in a document edited in the **Text** edited mode, make sure that both the **Detect indent on open** and **Detect line width on open** *(on page 212)* options are selected.

Use zero-indent, if detected

By default, if no indent was detected in the document, the fixed-size indent is used. Select this option if all of your documents have no indentation and you want to keep them that way.

Indent with tabs

If selected, indents are created using TAB characters. If unchecked, lines are indented using space characters. Selecting this option automatically disables the **Detect indent on open** *(on page 210)* option.

Indent size

The meaning of this setting depends on the following:

- If the **Detect indent on open** option *(on page 210)* is selected and TAB characters are detected at the beginning of the line, the *indent size* is the width of a TAB character. Otherwise, the *indent size* value is ignored and Oxygen XML Editor uses the number of detected SPACE characters.
- If the **Indent with tabs** option *(on page 211)* is selected, the *indent size* is the width of a TAB character.
- If neither of these options are selected, the *indent size* is the number of SPACE characters used for indenting the text lines.

For additional information about changing the *indent size*, see Setting an Indent Size to Zero *(on page 570)*.

For information about when this setting is used, see Where Indent Size and Line Width Settings are Used in Oxygen XML Editor *(on page 213)*.

Indent on enter

If selected, when you press **Enter** to insert a line break in the **Text** editing mode, an indentation will be added to the new line.

Enable smart enter

If selected, when you press the **Enter** key between a start and an end XML tag in the **Text** editing mode, the cursor is placed in an indented position on the empty line formed between the start and end tag.

Format and indent the document on open

If selected, an XML document is formatted and indented before opening it in Oxygen XML Editor.

> **Note:**
> Some specialized types of XML documents do not benefit from this feature, including Relax NG, XSD, XSL, and Ant. However, the feature is available for some non-XML types of documents, such as CSS and JSON.

Detect line width on open

If selected, Oxygen XML Editor automatically detects the line width when the document is opened.

Hard line wrap (Limit to "Line width - Format and Indent")

If selected, when typing content in the **Text** editing mode and the maximum line width is reached, a line break is automatically inserted.

Line width - Format and Indent

Defines the number of characters after which the **Format and Indent** (pretty-print) action performs hard line-wrapping. For example, if set to 100, after a **Format and Indent** action, the longest line will have a maximum of 100 characters. This setting is also used when saving XML content edited in the **Author** editing mode.

> **Note:**
> To avoid having an indent that is longer than the line width setting and without having sufficient space available for the text content, the indent limit is actually set at half the value of the **Line width - Format and Indent** setting. The remaining space is reserved for text.

For information about when this setting is used, see Where Indent Size and Line Width Settings are Used in Oxygen XML Editor *(on page 213)*.

Clear undo buffer before Format and Indent

The **Format and Indent** operation can be *undone*, but if used intensively, a considerable amount of the memory allocated for Oxygen XML Editor will be used for storing the undo states. If this option is selected, Oxygen XML Editor empties the undo buffer before doing a **Format**

and Indent operation. This means you will not be able to undo any changes you made before the format and indent operation. Select this option if you encounter out of memory problems (**OutOfMemoryError**) when performing the **Format and Indent** operation.

Where Indent Size and Line Width Settings are Used in Oxygen XML Editor

The values set in the **Indent Size** and **Line Width - Format and Indent** options are used in various places in the application, including the following:

- When the **Format and Indent** action is used in the **Text** editing mode.
- When you press **Enter** to break a line in the **Text** editing mode.
- When the **Hard line wrap (Limit to "Line width - Format and Indent")** option is selected and the maximum line width is reached while editing in the **Text** mode.
- When the XML is serialized by saving content in the **Author** editing mode.

Resources

For more information about the formatting options offered by Oxygen XML Editor, watch our video demonstration:

https://www.youtube.com/embed/1plmdN0Cfso

XML Preferences

To configure the **XML** Formatting options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Format > XML**.

The following options are available:

Format Section

This section includes the following drop-down boxes:

Preserve empty lines

The **Format and Indent** operation preserves all empty lines found in the document.

Preserve text as it is

The **Format and Indent** operation preserves text content as it is, without removing or adding any white space.

Preserve line breaks in attributes

Line breaks found in attribute values are preserved.

Note:
When this option is selected, the **Break long attributes** option *(on page 214)* is automatically disabled.

Break long attributes

The **Format and Indent** operation breaks long attribute values.

Indent inline elements

The *inline elements* are indented on separate lines if they are preceded by white spaces and they follow another element start or end tag. For example:

Original XML:

```
<root>
  text <parent> <child></child> </parent>
</root>
```

Indent inline elements selected:

```
<root> text <parent>
    <child/>
  </parent>
</root>
```

Indent inline elements not selected:

```
<root> text <parent> <child/> </parent> </root>
```

Expand empty elements

If not selected (default), the **Format and Indent** operation results in an empty XML element being serialized in a compact form (`<a atr1="v1"/>`). If selected, the same operation results in empty XML elements being serialized in expanded form (for example, `<a atr1="v1"></a>`).

Notes:

- When using the **Format and Indent** operation in **Text** mode, if the **Schema-aware format and indent** option *(on page 216)* is enabled, Oxygen XML Editor will use information from the associated schema and avoid expanding tags for elements that are defined as *empty* in the schema.
- When saving a document in **Author** mode, if the **Schema-aware normalization, format, and indent** option in the **Schema-Aware** preferences page *(on page 188)* is enabled, Oxygen XML Editor will use information from the associated schema and avoid expanding tags for elements that are defined as *empty* in the schema (therefore, text or other elements are not allowed inside them).

Sort attributes

The **Format and Indent** operation sorts the attributes of an element lexicographically.

Add space before slash in empty elements

Inserts a space character before the trailing / and > of empty elements.

Break line before an attribute name

When selected, the **Format and Indent** operation always breaks the line before any attribute name in an XML element. By default, the setting is not selected, which means that new lines might still be added before the attribute names but only if the line of content would overflow the maximum line width specified in the **Format** preferences page *(on page 210)*.

Element Spacing Section

This section controls how the application handles whitespaces found in XML content. You can **Add** or **Remove** element names or simplified XPath expressions in the various tabs.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use *AND/OR* boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- *element[@attr]* - Matches all instances of the specified element that include the specified attribute.
- *element[not(@attr)]* - Matches all instances of the specified element that do not include the specified attribute.
- *element[@attr = "value"]* - Matches all instances of the specified element that include the specified attribute with the given value.
- *element[@attr != "value"]* - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

Example: The following is an example of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[@a and @b or @c and @d]
*[@a and (@b or @c) and @d]
```

The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1/elementName2/elementName3`

- `//xs:localName` Note: The namespace prefixes (such as `xs`) are treated as part of the element name without taking its binding to a namespace into account.
- `//xs:documentation[@lang="en"]`

The tabs are as follows:

Preserve space

List of elements that will have the **Format and Indent** operation preserve the whitespaces (such as blanks, tabs, and newlines).

Default space

List of elements that will have the content normalized (multiple contiguous whitespaces are replaced by a single space), before applying the **Format and Indent** operation.

Mixed content

The elements from this list are treated as mixed content when applying the **Format and Indent** operation. The lines are split only when whitespaces are encountered.

Line break

List of elements that will have line breaks inserted, regardless of their content. You can choose to break the line *before* the element, *after*, or both.

Schema-aware format and indent

The **Format and Indent** operation takes the schema information into account with regard to the *space preserve*, *mixed*, or *element only* properties of an element.

Indent Section

Includes the following options:

Indent (when typing) in preserve space elements

Normally, the *Preserve space* elements (identified by the `xml:space` attribute set to `preserve` or by their presence in the **Preserve space** tab of the **Element Spacing** list *(on page 215)*) are ignored by the **Format and Indent** operation. When this option is selected and you edit one of these elements, its content is formatted.

Indent on paste - sections with number of lines less than 300

When you paste a chunk of text that has fewer than 300 lines, the inserted content is indented. To keep the original indent style of the document you copy content from, deselect this option.

Whitespaces Preferences

When Oxygen XML Editor formats and indents XML documents, a whitespace normalization process is applied, thus replacing whitespace sequences with single space characters. Oxygen XML Editor allows you to configure which Unicode characters are treated as spaces during the normalization process.

To configure the **Whitespace** preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Format > XML > Whitespaces**.

This table lists the Unicode whitespace characters. Select any that you want to have treated as whitespace when formatting and indenting an XML document.

The whitespaces are normalized when:

- The **Format and Indent** action is applied on an XML document.
- You switch from **Text** mode to **Author** mode.
- You switch from **Author** mode to **Text** mode.

Note:
The whitespace normalization process replaces any sequence of characters declared as whitespaces in the **Whitespaces** table with a single space character (`U+0020`). If you want to be sure that a certain whitespace character will not be removed in the normalization process, deselect it in the **Whitespaces** table.

Important:
The characters with the codes `U+0009` (TAB), `U+000A` (LF), `U+000D` (CR) and `U+0020` (SPACE) are always considered to be whitespace characters and cannot be deselected.

XQuery Preferences

To configure the **XQuery** Formatting options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Format > XQuery**.

The following options are available:

- **Preserve line breaks** - All initial line breaks are preserved.
- **Break line before an attribute name** - Each attribute of an XML element is written on a new line and properly indented.

XPath Preferences

To configure the **XPath** Formatting options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Format > XPath**.

The following option is available:

Format XPath code embedded in XSLT, XSD and Schematron files

If selected, the **Format and Indent** action applied on an XSD, XSLT, or Schematron document will perform an XPath-specific formatting on the values of the attributes that accept XPath expressions.

Note:
For XSLT documents, the formatting is not applied to *attribute value templates*.

CSS Preferences

Oxygen XML Editor can format and indent your CSS files. To configure the **CSS** formatting options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Format > CSS**.

The following options control how your CSS files are formatted and indented:

Class body on new line

If selected, the *class* body (including the curly brackets) is placed on a new line. This option is not selected by default.

Indent class content

When selected (default state), the *class* content is indented.

Add space before the value of a CSS property

When selected (default state), whitespaces are added between the `:` (colon) and the value of a style property.

Add new line between classes

If selected, an empty line is added between two classes. This option is not selected by default.

Preserve empty lines

When selected (default state), the empty lines from the CSS content are preserved.

Allow formatting embedded CSS

When selected (default state), CSS content that is embedded in XML is also formatted when the XML content is formatted.

JavaScript Preferences

To configure the **JavaScript** format options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Format > JavaScript**.

The following options control the behavior of the **Format and Indent** action:

- **Start curly brace on new line** - Opening curly braces start on a new line.
- **Preserve empty lines** - Empty lines in the JavaScript code are preserved. This option is selected by default.
- **Allow formatting embedded JavaScript** - Applied only to XHTML documents, this option allows Oxygen XML Editor to format embedded JavaScript code, taking precedence over the Schema-aware format and indent *(on page 216)* option. This option is selected by default.

Content Completion Preferences

Oxygen XML Editor provides a *Content Completion Assistant (on page 3418)* that provides a list of available options at any point in a document and can auto-complete structures, elements, and attributes. To configure the **Content Completion** preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Content Completion**. These options control how the *Content Completion Assistant* works.

The following options are available:

Auto close the last opened tag

When selected, Oxygen XML Editor automatically closes the last open tag when you type `</`.

Automatically rename/delete/comment matching tags

If you rename, delete, or comment out a start tag, Oxygen XML Editor automatically renames, deletes, or comments out the matching end tag.

> **Note:**
> If you select **Toggle comment** for multiple starting tags and the matching end tags are on the same line as other start tags, the end tags are not commented.

Enable content completion

Toggles the content completion feature on or off.

Consider subsequent sibling elements

When this option is selected (default), the subsequent sibling elements of the current element are taken into account when using the *Content Completion Assistant*. For example, in DITA, if you invoke the content completion before an already inserted required element (e.g. a `<title>` element), the content completion mechanism will not offer a proposal to insert a title (since it was already inserted).

Close the inserted element

When you choose an entry from the *Content Completion Assistant* list of proposals, Oxygen XML Editor inserts both start and end tags. The following additional options are available with regard to closing the element:

- **If it has no matching tag** - The end tag of the inserted element is automatically added only if it is not already present in the document.
- **Add element content** - Oxygen XML Editor inserts the required elements specified in the DTD, XML Schema, or RELAX NG schema that is associated with the edited XML document.
  - **Add optional content** - If selected, Oxygen XML Editor inserts the optional elements specified in the DTD, XML Schema, or RELAX NG schema.
  - **Add first Choice particle** - If selected, Oxygen XML Editor inserts the first **choice** particle specified in the DTD, XML Schema, or RELAX NG schema.

Case sensitive search

When selected, the search in the *Content Completion Assistant* is case-sensitive when you type a character ('a' and 'A' are different characters).

> **Note:**
> This option is ignored when the current language itself is not case-sensitive. For example, the case is ignored in the CSS language.

Position cursor between tags

When selected, Oxygen XML Editor automatically moves the cursor between the start and end tag after inserting the element. This only applies to:

- Elements with only optional attributes or no attributes at all.
- Elements with required attributes, but only when the **Insert the required attributes** option *(on page 220)* is not selected.

Show all entities

Oxygen XML Editor displays a list with all the internal and external entities declared in the current document when you type the start character of an entity reference (for example, `&`).

Insert the required attributes

If selected, Oxygen XML Editor automatically inserts the required attributes taken from the DTD or XML Schema for an element inserted with the *Content Completion Assistant*. For ID attributes that are required, a unique value is automatically generated for each new ID.

Insert the fixed attributes

If selected, Oxygen XML Editor automatically inserts any `FIXED` attributes from the DTD or XML Schema for an element inserted with the *Content Completion Assistant*.

Show recently used items

When selected, Oxygen XML Editor remembers the last inserted items from the *Content Completion Assistant* window. The number of items to be remembered is limited by the **Maximum number of recent items shown** list box. These most frequently used items are displayed on the top of the content completion window and are separated from the rest of the suggestions by a thin gray line .

Maximum number of recent items shown

Specifies the limit for the number of recently used items presented at the top of the *Content Completion Assistant* window.

Learn attributes values

When selected, Oxygen XML Editor learns the attribute values used in a document.

Learn on open document

Oxygen XML Editor automatically learns the document structure when the document is opened.

Learn words (Dynamic Abbreviations, available on Ctrl+Space

When selected, Oxygen XML Editor learns the typed words and makes them available in a content completion fashion by pressing **Ctrl + Space** on your keyboard;

> **Note:**
> For the words to be learned, they need to be separated by space characters.

Activation delay of the proposals window (ms)

Delay in milliseconds from the last key press until the *Content Completion Assistant* is displayed.

Related information

Configuring the Proposals for Attribute and Element Values *(on page 2319)*

XSLT Preferences

XSLT stylesheets are often used to create output in XHTML or XSL-FO. In addition to suggesting content completion options for XSLT stylesheet elements, Oxygen XML Editor can suggest elements from these vocabularies. To configure the XSLT content completion options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Content Completion > XSLT**.

The following options are available:

Include elements declared in the schema section

This section includes options with regard to detecting elements from the declared schema.

Automatically detect HTML or Formatting Objects

Detects if the output being generated is HTML or FO and provides content completion for those vocabularies. Oxygen XML Editor analyzes the namespaces declared in the root element to find an appropriate schema.

If the detection fails, Oxygen XML Editor uses one of the following options:

- **None** - The *Content Completion Assistant (on page 3418)* suggests only XSLT elements.
- **HTML** - The *Content Completion Assistant (on page 3418)* includes HTML elements, including HTML5 elements (such as `<video>`, `<canvas>`, etc.).
- **Formatting objects** - The *Content Completion Assistant (on page 3418)* includes Formatting Objects (XSL-FO) elements as substitutes for `<xsl:element>`.
- **Custom schema** - If you want content completion hints for another output vocabulary, you can use this option to specify the path to the schema for that vocabulary. The supported schema types are DTD, XML Schema, RNG schema, or NVDL schema for inserting elements from the target language of the stylesheet.

Documentation schema section

This section specifies an additional schema that will be used for documenting XSL stylesheets. You can choose between the following:

- **Built-in schema** - Uses the built-in schema for documentation.
- **Custom schema** - Allows you to specify a custom schema for documentation. The supported schema types are XSD, RNG, RNC, DTD, and NVDL.

XPath Preferences

Oxygen XML Editor provides content-completion support for XPath expressions. To configure the options for the content completion in XPath expressions, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Content Completion > XPath**.

The following options are available:

- **Enable content completion for XPath expressions** - Enables the *Content Completion Assistant* in XPath expressions *(on page 907)* that you enter in the `@match`, `@select`, and `@test` XSL attributes and also in the XPath toolbar *(on page 2118)*.
  - **Include XPath functions** - When this option is selected, XPath functions are included in the content completion suggestions.
  - **Include XSLT functions** - When this option is selected, XSLT functions are included in the content completion suggestions.
  - **Include axes** - When this option is selected, XSLT axes are included in the content completion suggestions.
- **Show signatures of XSLT / XPath functions** - Makes the editor indicate the signature of the XPath function located at the cursor position in a tooltip. See the XPath Tooltip Helper *(on page 911)* section for more information.
- **Function signature window background** - Specifies the background color of the tooltip window.
- **Function signature window foreground** - Specifies the foreground color of the tooltip window.

XSD Preferences

Oxygen XML Editor provides content completion assistance when you are writing XML Schema (XSD). To configure XSD preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Content Completion > XSD**. The option in this preferences page allows you to define additional elements to be suggested by the *Content Completion Assistant (on page 3418)* in `<xs:appinfo>` elements (in addition to the elements defined in the XML Schema).

The following option is available:

When in "xs:appinfo" context, also include elements declared in the schema

You can choose between the following:

- **None** - The *Content Completion Assistant* offers only the XML Schema schema information.
- **ISO Schematron** - The *Content Completion Assistant* also includes ISO Schematron elements in `<xs:appinfo>`.
- **Schematron 1.5** - The *Content Completion Assistant*also includes Schematron 1.5 elements in `<xs:appinfo>`.
- **Other** - The *Content Completion Assistant* also includes elements from an XML Schema identified by a URL in `<xs:appinfo>` elements.

JavaScript Preferences

Oxygen XML Editor can provide content completion suggestions when you are writing JavaScript files. To configure content completion support for JavaScript, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Content Completion > JavaScript**. You can configure the following options:

Enable content completion

Enables the content completion support for JavaScript files.

Use built-in libraries

Allows Oxygen XML Editor to include components (object names, properties, functions, and variables) collected from the built-in JavaScript library files when making suggestions.

Use defined libraries

Oxygen XML Editor can also use JavaScript libraries when making suggestions. List the paths (URIs) of any JavaScript files you want Oxygen XML Editor to use when making suggestions.

Note:
The paths can contain editor variables *(on page 332)* such as `${pdu}`, or `${oxygenHome}`. You can make these paths relative to the project directory or installation directory.

JSON Preferences

Oxygen XML Editor can provide content completion suggestions when you are editing JSON files. To configure content completion support for JSON, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Content Completion > JSON**. You can configure the following options:

Generate required content

When invoking content completion over JSON files, all contextual required content is automatically generated according to the specifications from the associated JSON Schema.

Generate optional properties

If selected, optional properties that are defined in the associated JSON Schema will be added when using content completion in JSON files.

Generate additional content

If selected, additional properties (or additional items for arrays) that are defined in the associated JSON Schema will be added when using content completion in JSON files.

YAML Preferences

Oxygen XML Editor can provide content completion suggestions when you are editing YAML files. To configure content completion support for YAML, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Content Completion > YAML**. You can configure the following options:

Generate required content

When invoking content completion over YAML files, all contextual required content is automatically generated according to the specifications from the associated JSON schema.

Property value

You can specify the way the values of the properties are generated. The following options are available:

- *None* - Assigns empty values for properties (a template file will be generated). This is the default value.
- *Default* - Assigns the name of the property as the value (for strings) or assigns the specified minimum value (for numbers).
- *Random* - Assigns random values according to schema restrictions.

Generate optional properties

If selected, optional properties that are defined in the associated JSON schema will be added when using content completion in YAML files.

Generate additional content

If selected, additional properties (or additional items for arrays) that are defined in the associated JSON schema will be added when using content completion in YAML files.

Annotations Preferences

Certain types of schemas (XML Schema, DTDs, Relax NG) can include annotations that document the various elements and attributes that they define. Oxygen XML Editor can display these annotations when offering content completion suggestions. To configure the **Annotations** preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Content Completion > Annotations**.

The following options are available:

Show annotations in Content Completion Assistant

If selected, Oxygen XML Editor displays the schema annotations of an element, attribute, or attribute value currently selected in the *Content Completion Assistant (on page 3418)* proposals list.

Show annotations in tooltip

If selected, Oxygen XML Editor displays the annotation of elements and attributes as a tooltip when you hover over them with the cursor in the editing area or in the **Elements** view. If not selected, tooltips are disabled in all modes.

Show annotation in HTML format, if possible

This option allows you to view the annotations associated with an element or attribute in HTML format. It is available when editing XML documents that have associated an XML Schema or Relax NG schema. If this option is not selected, the annotations are converted and displayed as plain text.

Prefer DTD comments that start with "doc:" as annotations

To address the lack of dedicated annotation support in DTD documents, Oxygen XML Editor recommends prefixing with the `doc:` particle all comments intended to be shown to the developer who writes an XML validated against a DTD schema.

If this option is selected, Oxygen XML Editor uses the following mechanism to collect annotations:

- If at least one `doc:` comment is found in the entire DTD, only comments of this type are displayed as annotations.
- If no `doc:` comment is found in the entire DTD, all comments are considered annotations and displayed as such.

If not selected, all comments, regardless of their type, are considered annotations and displayed as such.

Use all Relax NG annotations as documentation

If selected, any element outside the Relax NG namespace, that is `http://relaxng.org/ns/structure/1.0`, is considered annotation and is displayed in the annotation window next to the *Content Completion Assistant (on page 3418)* window and in the **Model** view *(on page 555)*. When this option is not selected, only elements from the Relax NG annotations namespace, that is `http://relaxng.org/ns/compatibility/annotations/1.0` are considered annotations.

Related information

Schema Annotations in Text Mode *(on page 544)*

Code Templates Preferences

Code templates are code fragments that can be inserted at the current editing position. Oxygen XML Editor includes a set of built-in templates for CSS, LESS, Schematron, XSL, XQuery, JSON, HTML, and XML Schema document types. You can also define your own code templates *(on page 547)* for any type of file and share them with your colleagues *(on page 548)* using the template export and import functions.

To configure **Code Templates**, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Templates > Code Templates**.

This preferences page contains a list of all the available code templates (both built-in and custom created ones) and a code preview area. You can disable any code template by deselecting it.

The following actions are available:

New

Opens the **Code template** dialog box that allows you to define a new code template. You can define the following fields:

- **Name** - The name of the code template.
- **Description** - [Optional] The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the *Content Completion Assistant (on page 3418)*. HTML markup can be used for better rendering.
- **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
- **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the **Clear** button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
  - **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
  - **M2** represents the **Shift** key.
  - **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
  - **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable *(on page 332)* can be inserted in the text box using the  **Insert Editor Variables** button.

Edit

Opens the **Code template** dialog box and allows you to edit an existing code template. You can edit the following fields:

- **Description** - [Optional] The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the *Content Completion Assistant (on page 3418)*. HTML markup can be used for better rendering.
- **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the **Clear** button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
  - **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
  - **M2** represents the **Shift** key.
  - **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
  - **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable *(on page 332)* can be inserted in the text box using the  **Insert Editor Variables** button.

Duplicate

Creates a duplicate of the currently selected code template.

Delete

Deletes the currently selected code template. This action is not available for the built-in code templates.

Export

Exports a file with code templates.

Import

Imports a file with code templates that was created by the **Export** action.

You can use the following editor variables *(on page 332)* when you define a code template in the **Content** text box:

- **${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a **selection** *plugin*.

Note:
The **${caret}** editor variable is available only for parameters that take XML content as values. It is replaced with the **${UNIQUE_CARET_MARKER_FOR_AUTHOR}** macro. The default Author operations process this macro and position the cursor at the designated offset.

Note:
The **${caret}** editor variable can be used for setting a fixed cursor position inside an XML fragment. To set the cursor position depending on the fragment inserted in the document, you can use **AuthorDocumentFilter** and inside the **insertFragment(AuthorDocumentFilterBypass, int, AuthorDocumentFragment)** method, use the **AuthorDocumentFragment.setSuggestedRelativeCaretOffset(int)** API on the given fragment.

- **${selection}** - The currently selected text content in the currently edited document. This variable can be used in a code template, in **Author** mode operations, or in a **selection** *plugin*.
- **${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value', @id)}** - To prompt for values at runtime, use the *ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value')* editor variable. You can set the following parameters:
  - **'message'** - The displayed message. Note the quotes that enclose the message.
  - **'default-value'** - Optional parameter. Provides a default value.
  - **@id** - Optional parameter. Used for identifying the variable to reuse the answer using the **${answer(@id)}** editor variable.
  - **type** - Optional parameter (defaults to **generic**), with one of the following values:

    Note:
    The title of the dialog box will be determined by the type of parameter and as follows:
    - For *url* and *relative_url* parameters, the title will be the name of the parameter and the value of the *'message'*.
    - For the other parameters listed below, the title will be the name of that respective parameter.
    - If no parameter is used, the title will be "Input".

    Notice:
    Editor variables that are used within a parameter of another editor variable must be escaped within single quotes for them to be properly expanded. For example:

    ```
    ${ask( 'Provide a date',generic,'${date(yyyy-MM-dd'T'HH:MM)}')}
    ```

Parameter	
generic (default)	**Format**: *${ask('message', generic, 'default')}*
	Description: The input is considered to be generic text that requires no special handling.
	Example:

Parameter	
	▪ *${ask('Hello world!')}* - The dialog box has a *Hello world!* message displayed. ▪ *${ask('Hello world!', generic, 'Hello again!')}* - The dialog box has a *Hello world!* message displayed and the value displayed in the input box is *'Hello again!'*.
url	**Format:** *${ask('message', url, 'default_value')}*
	Description: Input is considered a URL. Oxygen XML Editor checks that the provided URL is valid.
	Example: ▪ *${ask('Input URL', url)}* - The displayed dialog box has the name *Input URL*. The expected input type is URL. ▪ *${ask('Input URL', url, 'http://www.example.com')}* - The displayed dialog box has the name *Input URL*. The expected input type is URL. The input field displays the default value *http://www.example.com*.
relative_url	**Format:** *${ask('message', relative_url, 'default')}*
	Description: Input is considered a URL. This parameter provides a file chooser, along with a text field. Oxygen XML Editor tries to make the URL relative to that of the document you are editing. **Note:** If the *$ask* editor variable is expanded in content that is not yet saved (such as an *untitled* file, whose path cannot be determined), then Oxygen XML Editor will transform it into an absolute URL.
	Example: *${ask('File location', relative_url, 'C:/example.txt')}* - The dialog box has the name *'File location'*. The URL inserted in the input box is made relative to the currently edited document location.
password	**Format**: *${ask('message', password, 'default')}*
	Description: The input is hidden with bullet characters.
	Example:

Parameter	
	▪ *${ask('Input password', password)}* - The displayed dialog box has the name *'Input password'* and the input is hidden with bullet symbols. ▪ *${ask('Input password', password, 'abcd')}* - The displayed dialog box has the name *'Input password'* and the input hidden with bullet symbols. The input field already contains the default **abcd** value.
combobox	**Format:** *${ask('message', combobox, ('real_value1':'rendered_value1';..-.;'real_valueN':'rendered_valueN'), 'default')}*
	Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given *rendered_value* values. Choosing such a value will return its associated value (*real_value*). **Note:** The list of *'real_value':'rendered_value'* pairs can be computed using *${xpath_eval()}*. **Note:** The *'default'* parameter specifies the default-selected value and can match either a key or a value.
	Example: ▪ *${ask('Operating System', combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}* - The dialog box has the name *'Operating System'*. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection. **Note:** In this example, the default value is indicated by the *osx* key. However, the same result could be obtained if the default value is indicated by *macOS*, as in the following example: *${ask('Operating System', combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macOS')}*

Parameter	
	▪ *${ask('Mobile OS', combobox, ('ios':'iOS';'and':'Android'), 'Android')}* ▪ *${ask('Mobile OS', combobox, (${xpath_eval(for $pair in (['ios', 'iOS'], ['and', 'Android']) return '"' || $pair?1 || '":"' || $pair?2 || '";')}), 'ios')}*
editable_combobox	**Format:** *${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}*
	Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given *rendered_value* values. Choosing such a value will return its associated real value (*real_value*) or the value inserted when you edit a list entry. **Note:** The list of *'real_value':'rendered_value'* pairs can be computed using *${xpath_eval()}*. **Note:** The *'default'* parameter specifies the default-selected value and can match either a key or a value.
	Example: ▪ *${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}* - The dialog box has the name *'Operating System'*. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input. ▪ *${ask('Operating System', editable_combobox, (${xpath_eval(for $pair in (['win', 'Microsoft Windows'], ['macos', 'macOS'], ['lnx', 'Linux/UNIX']) return '"' || $pair?1 || '":"' || $pair?2 || '";')}), 'ios')}*
radio	**Format:** *${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}*
	Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a *'rendered_value* and will return an associated *real_value*.

Parameter	
	Note: The list of *'real_value':'rendered_value'* pairs can be computed using *${xpath_eval()}*. **Note:** The *'default'* parameter specifies the default-selected value and can match either a key or a value. **Example:** ▪ *${ask('Operating System', radio, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}* - The dialog box has the name *'Operating System'*. The radio button group allows you to choose between the three operating systems. **Note:** In this example, `macOS` is the default-selected value and if selected, it would return *macos* for the output. ▪ *${ask('Operating System', radio, (${xpath_eval(for $pair in (['win', 'Microsoft Windows'], ['macos', 'macOS'], ['lnx', 'Linux/UNIX']) return '"' || $pair?1 || '":"' || $pair?2 || '";")}), 'ios')}*

- **${timeStamp}** - The timestamp, which is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- **${uuid}** - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.
- **${id}** - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- **${cfn}** - Current file name without the extension and parent folder. The current file is the one currently open and selected.
- **${cfne}** - Current file name with extension. The current file is the one currently open and selected.
- **${cf}** - Current file as file path, that is the absolute file path of the currently edited document.
- **${cfd}** - Current file folder as file path, that is the path of the currently edited document up to the name of the parent folder.
- **${frameworksDir}** - The path (as file path) of the `frameworks` directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main `frameworks` folder defined in the **Document Type Association > Locations** preferences page.

- **${pd}** - The file path to the folder that contains the current project file (`.xpr`).
- **${oxygenInstallDir}** - Oxygen XML Editor installation folder as file path.
- **${homeDir}** - The path (as file path) of the user home folder.
- **${pn}** - Current project name.
- **${env(VAR_NAME)}** - Value of the *VAR_NAME* environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **${system(var.name)}** editor variable.
- **${system(var.name)}** - Value of the *var.name* Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as *-Dvar.name=var.value*. If you are looking for operating system environment variables, use the **${env(VAR_NAME)}** editor variable instead.
- **${date(pattern)}** - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. **Example:** *yyyy-MM-dd*.

> **Note:**
> This editor variable supports both the **xs:date** and **xs:datetime** parameters. For details about **xs:date**, go to: http://www.w3.org/TR/xmlschema-2/#date. For details about **xs:datetime**, go to: http://www.w3.org/TR/xmlschema-2/#dateTime.

Code Templates *(on page 546)*

Syntax Highlight Preferences

Oxygen XML Editor supports syntax highlighting in the **Text** mode editors for numerous types of documents, including XML, XHTML, JavaScript, XQuery, XPath, PHP, PowerShell, CSS, LESS, Markdown, Text, DTD, RNC, Java, JSON, Ant, and more.

To configure syntax highlighting, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Syntax Highlight**.

To set syntax colors for a language, expand the listing for that language in the top panel to show the list of syntax items for that type of document. Use the color and style selectors to change how each syntax item is displayed. The results of your changes are displayed in the **Preview** panel. If you do not know the name of the syntax token that you want to configure, click that token in the **Preview** area to select it.

> **Note:**
> All default color sets come with a high-contrast variant that is automatically used when you switch to a black-background or white-background high-contrast theme in your Windows operating system settings. The high-contrast theme will not overwrite any default color you set in **Editor > Syntax Highlight** preferences page.

The settings for XML documents are also used in XSD, XSL, RNG documents and the **Preview** area has a separate tab for each of them when **XML** is selected in the top pane.

The **Enable nested syntax highlight** option controls whether or not content types that are nested in the same file (such as PHP, JS, or CSS scripts inside an HTML file) are highlighted according to the color schemes defined for each content type.

Elements/Attributes by Prefix Preferences

Oxygen XML Editor allows you to specify syntax highlighting colors for elements and attributes with specific namespace prefixes. To configure the **Elements/Attributes by Prefix** preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Syntax Highlight > Elements/Attributes by Prefix**.

To change the syntax coloring for a specific namespace prefix, choose the prefix from the list, or add a new one using the **New** button, and use the color and style selectors to set the syntax highlighting style for that namespace prefix.

Note:
Syntax highlighting is based on the literal namespace prefix, not the namespace that the prefix is bound to in the document.

If you only want the prefix (and not the whole element or attribute name) to be styled with a particular color, select the **Draw only the prefix with a separate color** option.

Mark Occurrences Preferences

This preferences page specifies which types of files will have the Highlight IDs Occurrences *(on page 576)* feature activated. To configure these options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Mark Occurrences**:

The following options are available in this preferences page:

Highlight component occurrences in the current file for:

- **XML files** - Activates the Highlight IDs Occurrences *(on page 576)* feature in XML files.
- **XSLT files** - Activates the Highlight Component Occurrences *(on page 1251)* feature in XSLT files.
- **XML Schema files** - Activates the Highlight Component Occurrences *(on page 1251)* feature in XSD files.
- **WSDL files** - Activates the Highlight Component Occurrences *(on page 1251)* feature in WSDL files.
- **RNG files** - Activates the highlight component occurrences feature in RNG files.
- **Schematron files** - Activates the Highlight Component Occurrences *(on page 1251)* feature in Schematron files.
- **Ant files** - Activates the Highlight Component Occurrences *(on page 957)* feature in Ant files.

Declaration highlight color

Allows you to choose the color to be used for highlighting component declarations.

Reference highlight color

Allows you to choose the color to be used for highlighting component references.

Document Validation Preferences

To configure document validation options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Document Validation**. This page contains preferences for configuring how a document is checked for both well-formedness and validation errors.

The following options are available:

Maximum number of validation highlights

If a validation generates more errors than the number specified in this option, only the errors up to this number are highlighted in the editor panel and on the stripe that is displayed at the right side of the editor panel. This option applies to both automatic validation and manual validation.

Validation fatal error highlight color

The color used to highlight fatal validation errors in the document.

Validation error highlight color

The color used to highlight validation errors in the document.

Validation warning highlight color

The color used to highlight validation warnings in the document.

Validation info highlight color

The color used to highlight validation info messages in the document.

Validation success color

The color used to highlight the success indicator of the validation operation in the vertical ruler bar.

Always show validation status

If this option is selected, the current validation error or warning is always visible in the message line at the bottom of the editor panel. This is useful when the **Enable automatic validation** option is selected and the vertical scroll bar changes position due to an error message being displayed.

Enable automatic validation

This causes the validation to be automatically executed in the background as the document is modified in Oxygen XML Editor.

Delay after the last key event (s)

The period of keyboard inactivity before starting a new validation (in seconds).

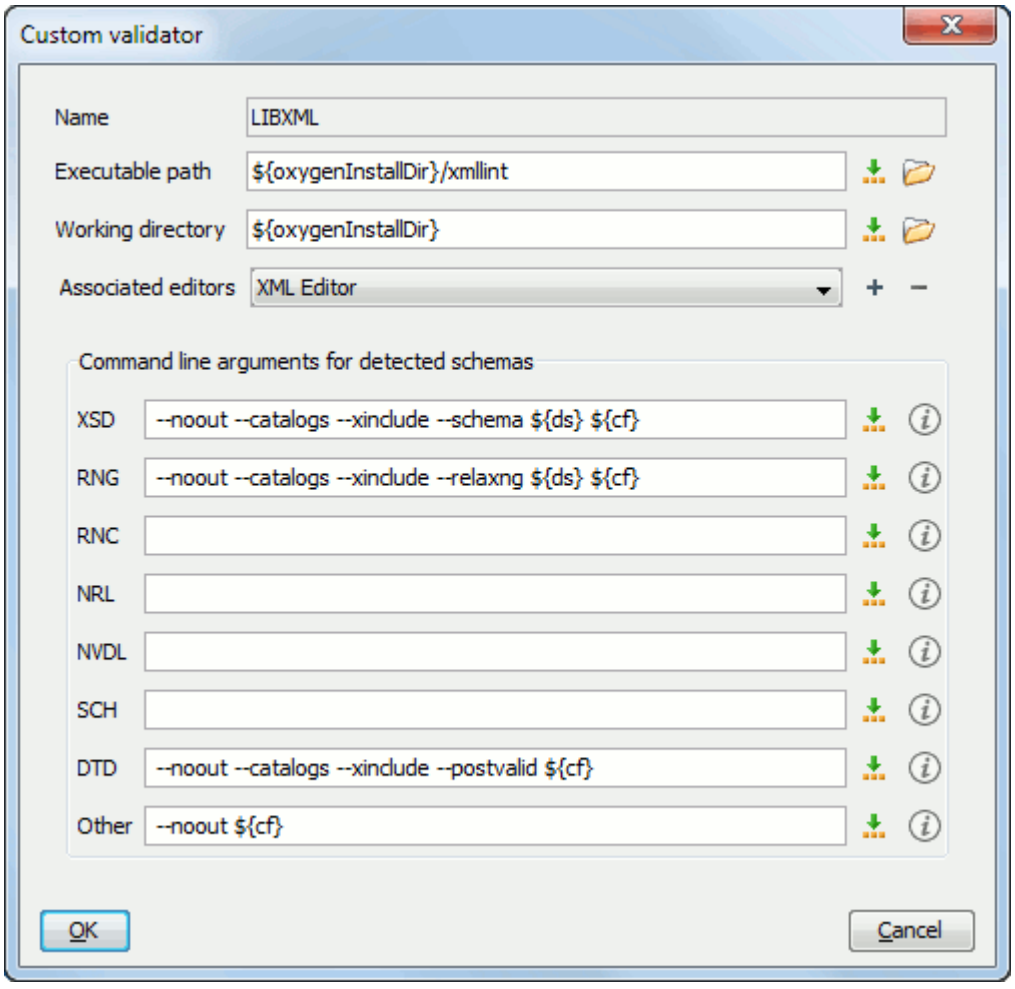
At the bottom of the preferences page you can choose whether or not the saved options will be shared with other users by selecting **Global** or **Project** storage options *(on page 320)*.

Custom Validation Engines Preferences

As the name implies, the **Custom Validation Engines** preferences page displays the list of custom validation engines that can be associated to a particular editor and used for validating documents. To access this page, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Document Validation > Custom Validation Engines**.

If you want to add a new custom validation tool or edit the properties of an existing one, you can use the **Custom Validator** dialog box displayed by pressing the **New** or **Edit** button.

Figure 29. Custom Validator Dialog Box



The **Custom Validator** dialog box allows you to configure the following parameters:

Name

Name of the custom validation engine that will be displayed in the **Validation** toolbar drop-down menu.

Executable path

Path to the executable file of the custom validation tool. You can specify the path by using the text field, the **Insert Editor Variables** *(on page 332)* button, or the **Browse** button.

Working directory

The working directory of the custom validation tool. You can specify the path by using the text field, the **Insert Editor Variables** *(on page 332)* button, or the **Browse** button.

Associated editors

The editors that can perform validation with the external tool (XML editor, XSL editor, XSD editor, etc.)

Command-line arguments for detected schemas

Command-line arguments used in the commands that validate the currently edited file against various types of schema (XML Schema, Relax NG full syntax, Relax NG compact syntax, NVDL, Schematron, DTD, etc.) The arguments can include any custom switch (such as -rng) and the following editor variables *(on page 332)*:

- **${cf}** - Current file as file path, that is the absolute file path of the currently edited document.
- **${currentFileURL}** - Current file as URL, that is the absolute file path of the currently edited document represented as URL.
- **${ds}** - The path of the detected schema as a local file path for the current validated XML document.
- **${dsu}** - The path of the detected schema as a URL for the current validated XML document.

Editor Variables *(on page 332)*

Increasing the Stack Size for Validation Engines

To prevent the appearance of a **StackOverflowException** error, use one of the following methods:

- Use the **com.oxygenxml.stack.size.validation.threads** property to increase the size of the stack for validation engines. The value of this property is specified in bytes. For example, to set a value of one megabyte specify 1x1024x1024=1048576. For information about how to setup the system property on the JVM, see Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor *(on page 348)*.
- Increase the value of the **-Xss** parameter.

> **Note:**
> Increasing the value of the **-Xss** parameter affects all the threads of the application.

Related information

Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor *(on page 348)*

Ignored Validation Problems Preferences

Some validation issues include a Quick Fix *(on page 824)* proposal that instructs the application to ignore that type of validation problem. The ignored problems are then listed in the **Ignored Validation Problems** preferences page. To access this page, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Document Validation > Ignored Validation Problems**.

The **Ignored Validation Problems** preferences page includes the following:

Enable support for ignoring validation problems

If this option is selected, the support for ignoring certain validation problems is enabled. This means that when you choose a Quick Fix proposal to ignore the particular validation problem *(on page 823)*, it is added to the table below this option.

Ignored problems table

The table includes an entry for each validation problem that has been ignored. The columns in the table include information about the **Severity**, **Problem ID**, **Message**, and **System ID**. The entries are added automatically when you choose a Quick Fix proposal to ignore the particular validation problem *(on page 823)*. You can delete an entry by selecting it and clicking the **Delete** button at the bottom of the table. The deleted problem is no longer ignored.

Tip:
Changes made in this preferences page can be saved at project level *(on page 321)* so that you can easily share your ignored problems configuration with others.

Spell Check Preferences

Oxygen XML Editor provides support for spell checking in the **Text** mode and **Author** mode. To configure the **Spell Check** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Spell Check**.

The following options are available:

Automatic spell check

This option is not selected by default. When selected, Oxygen XML Editor automatically checks the spelling as you type and highlights misspelled words in the document.

Select editors

You can select which editors (and therefore which file types) will automatically be spell checked. File types such as CSS and DTD are excluded by default since automatic spell checking is not usually helpful in these types of files.

Spell check highlight color

Use this option to set the color used by the spell check engine to highlight spelling errors.

Language options section

This section includes the following language options:

Default language

The default language list allows you to choose the language used by the spell check engine when the language is not specified in the source file. You can add additional dictionaries to the spell check engines *(on page 457)*.

Use "lang" and "xml:lang" attributes

When this option is selected, the contents of an element with one of the `@lang` or `@xml:lang` attributes is checked in that language. Choose between the following two options for instances when these attributes are missing:

- **Use the default language** - If the `@lang` and `@xml:lang` attributes are missing, the selection in the **Default language** list *(on page 239)* is used.
- **Do not check** - If the `@lang` and `@xml:lang` attributes are missing, the element is not checked.

XML spell checking in section

You can choose to check the spelling inside the following XML items:

- **Comments**
- **Processing instructions**
- **Attribute values**
- **Text**
- **CDATA**

Options section

This section includes the following other options:

Check capitalization

When selected, the spell checker reports detected capitalization errors.

Note:
When such problems are reported, they cannot be learned and ignored by the application as words stored in dictionaries, term lists, and the list of learned words are not handled as case-sensitive.

Check punctuation

When selected, the spell checker checks punctuation. Misplaced white space and unusual sequences, such as a period following a comma, are highlighted as errors.

Ignore mixed case words

When selected, the spell checker does not check words containing mixed case characters (for example, *SpellChecker*).

Ignore acronyms

Available only for the **Hunspell Spell Checker**. When selected, acronyms are not reported as errors.

Ignore words with digits

When selected, the spell checker does not check words containing digits (for example, *b2b*).

Ignore duplicates

When selected, the spell checker does not signal two successive identical words as an error.

Ignore URL

When selected, the spell checker ignores words recognized as URLs or file names (for example, *www.oxygenxml.com* or *c:\boot.ini*).

Allow compounds words

When selected, all words formed by concatenating multiple legal words with hyphens or underscores are accepted.

Allow file extensions

When selected, the spell checker accepts any word ending with recognized file extensions (for example, *myfile.txt* or *index.html*).

Ignore elements section

You can use the **Add** and **Remove** buttons to configure a list of element names or XPath expressions to be ignored by the spell checker. The following restricted set of XPath expressions are supported:

- '/' and '//' separators
- '*' wildcard

An example of an allowed XPath expression is: */a/*/b*.

AutoCorrect options link

Use this link to navigate to the **AutoCorrect** preferences page *(on page 201)*.

Spell Check Dictionaries Preferences

To set the Dictionaries preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Spell Check > Dictionaries**. This page allows you to configure the dictionaries (`.dic` files) and term lists (`.tdi` files) that Oxygen XML Editor uses and to choose where to save new learned words.

The following options are valid when Oxygen XML Editor uses the Hunspell spell checking engine:

Dictionaries and term lists default folder

Displays the default location where the dictionaries and term lists that Oxygen XML Editor uses are stored.

Include dictionaries and term list from

Selecting this option allows you to specify a location where you have stored dictionaries and term lists that you want to include, along with the default ones.

Important:
Consider the following notes regarding this option:

- The spell checker takes into account dictionaries and term lists collected both from the default and custom locations and multiple dictionaries and term lists from the same language are merged (for example, `en_UK.dic` from the default location is merged with `en_US.dic` from a custom location).
- If you have a generic dictionary file (one that just has a two-letter language code for its file name, such as `en.dic`) saved in either the default or custom location, the other more specific dictionaries (for example, `en_UK.dic` and `en_US.dic`) will not be merged and the existing generic dictionary will simply be used instead.
- If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

How to add more dictionaries and term lists link

Use this link to open a topic in the Oxygen XML Editor User Guide that explains how to add more dictionaries and term lists *(on page 461)*.

Save learned words in the following location

Specifies the target where the newly learned words are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Delete learned words

Opens the list of learned words, allowing you to select the items you want to remove, without deleting the dictionaries and term lists.

Note:
Words stored in dictionaries, term lists, and the list of learned words are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

Print Preferences

Oxygen XML Editor lets you configure how files are printed out of the editor. Note that these settings cover how files are printed directly from Oxygen XML Editor itself, not how they are printed after the XML source has been transformed by a publishing stylesheet. To configure the **Print** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Print**.

This page allows you to customize the headers and footers added to a printed page when you print from the **Text** mode *(on page 362)* or **Author** mode *(on page 363)* editors. These settings do not apply to the **Grid** *(on page 363)* and schema **Design** *(on page 364)* mode.

You can specify what is printed on the **Left**, **Middle**, and **Right** of the header and footer using plain text of any of the following variables:

- **${currentFileURL}** - Current file as URL, that is the absolute file path of the currently edited document represented as URL.
- **${cfne}** - Current file name with extension. The current file is the one currently open and selected.
- **${cp}** - Current page number. Used to display the current page number on each printed page in the **Editor / Print** Preferences page.
- **${tp}** - Total number of pages in the document. Used to display the total number of pages on each printed page in the **Editor / Print** Preferences page.
- **${env(VAR_NAME)}** - Value of the *VAR_NAME* environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **${system(var.name)}** editor variable.
- **${system(var.name)}** - Value of the *var.name* Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as *-Dvar.name=var.value*. If you are looking for operating system environment variables, use the **${env(VAR_NAME)}** editor variable instead.
- **${date(pattern)}** - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. **Example:** *yyyy-MM-dd*.

  Note:
  This editor variable supports both the **xs:date** and **xs:datetime** parameters. For details about **xs:date**, go to: http://www.w3.org/TR/xmlschema-2/#date. For details about **xs:datetime**, go to: http://www.w3.org/TR/xmlschema-2/#dateTime.

For example, to show the current page number and the total number of pages in the top right corner of the page, write the following pattern in the **Right** text area of the **Header** section: `${cp} of ${tp}`.

You can also set the **Color** and **Font** used in the header and footer. Default font is `SansSerif`.

You can place a line below the header or above the footer by selecting **Underline/Overline**.

CSS Validator Preferences

To configure the **CSS Validator** preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **CSS Validator**.

You can configure the following options for the built-in **CSS Validator** of Oxygen XML Editor:

- **Profile** - Selects one of the available validation profiles: **CSS 1**, **CSS 2**, **CSS 2.1**, **CSS 3**, **CSS 3 + SVG**, **CSS 3 with Oxygen extensions**, **SVG**, **SVG Basic**, **SVG Tiny**, **Mobile**, **TV Profile**, **ATSC TV Profile**. The **CSS 3 with Oxygen extensions** profile includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen *(on page 2451)* that can be used in Author mode *(on page 363)*. That means all **Oxygen**-specific extensions are accepted in a CSS stylesheet by the built-in CSS validator *(on page 1089)* when this profile is selected.
- **Media type** - Selects one of the available mediums: **all**, **aural**, **braille**, **embossed**, **handheld**, **print**, **projection**, **screen**, **tty**, **tv**, **presentation**, **oxygen**.
- **Warning level** - Sets the minimum severity level for reported validation warnings. Can be one of: **All**, **Normal**, **Most Important**, **No Warnings**.
- **Ignore properties** - You can type comma separated patterns that match the names of CSS properties that will be ignored at validation. The following vendor extensions are specified as ignored by default: **-ro-*** (*PDFreactor*), **-ah-*** (*Antenna House*), **prince-*** (*Prince*). As wildcards you can use:
  - ***** to match any string.
  - **?** to match any character.
- **Recognize browser CSS extensions (also applies to content completion)** - If selected, Oxygen XML Editor recognizes browser-specific CSS properties (no validation is performed). The *Content Completion Assistant (on page 3418)* lists these properties at the end of its list, prefixed with the following particles:
  - **-moz-** for *Mozilla*.
  - **-ms-** for *Edge*.
  - **-o-** for *Opera*.
  - **-webkit-** for *Safari/Webkit*.

XML Preferences

This section describes the panels that contain the user preferences related with XML.

XML Catalog Preferences

To configure options that pertain to *XML Catalogs (on page 3425)*, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XML Catalog**.

The following options are available:

Prefer

Determines whether public identifiers specified in the catalog are used in favor of system identifiers supplied in the document. Suppose you have an entity in your document that has both a public identifier and a system identifier specified, and the catalog only contains a mapping for the public identifier (for example, a matching public catalog entry). You can choose between the following:

- **system** - If selected, the system identifier in the document is used.
- **public** - If selected, the URI supplied in the matching public catalog entry is used. Generally, the purpose of catalogs is to override the system identifiers in XML documents, so **public** should usually be used for your catalogs.

Note:
If the catalog contains a matching system catalog entry giving a mapping for the system identifier, that mapping would have been used, the public identifier would never have been considered, and this setting would be irrelevant.

Verbosity

When using catalogs, it is sometimes useful to see what catalog files are parsed, if they are valid, and what identifiers are resolved by the catalogs. This option selects the detail level of such logging messages of the *XML catalog* resolver that will be displayed in the **Catalogs** table at the bottom of the window. You can choose between the following:

- **None** - No message is displayed by the catalog resolver when it tries to resolve a URI reference, a SYSTEM one or a PUBLIC one with the *XML catalogs* specified in this panel.
- **Unresolved entities** - Only the logging messages that track the failed attempts to resolve references are displayed.
- **All messages** - The messages of both failed attempts and successful ones are displayed.

Resolve schema locations also through system mappings

If selected, Oxygen XML Editor analyzes both *uri* and *system* mappings to resolve the location of schema.

Note:
This option is not applicable for DTD schemas since the public and system catalog mappings are always considered.

Process "schemaLocation" namespaces through URI mappings for XML Schema

If selected, the target namespace of the imported XML Schema is resolved through the *uri* mappings. The namespace is taken into account only when the schema specified in the

schemaLocation attribute was not resolved successfully. If not selected, the system IDs are used to resolve the schema location.

Use default catalog

If this option is selected and Oxygen XML Editor cannot resolve the catalog mapping with any other means, the default global catalog (listed below this checkbox) is used. For more information, see How Oxygen XML Editor Determines which Catalog to Use *(on page 839)*.

Catalogs table

You can use this table to add or manage global user-defined catalogs. The following actions are available at the bottom of the table:

Add

Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.

Edit

Opens a dialog box that allows you to edit an existing catalog. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.

Delete

Deletes the currently selected catalog from the list.

Up

Moves the selection to the previous resource.

Down

Moves the selection to the following resource.

Note:
When you add, delete, or edit a catalog in this table, you need to reopen the currently edited files that use the modified catalog or run a manual **Validate** action *(on page 786)* so that the changes take full effect.

You can also add or configure catalogs at *framework* level from the **Catalogs** tab *(on page 171)* in the **Document Type** configuration dialog box *(on page 147)*.

Related information

Controlling the Catalog Resolver
Working with XML Catalogs *(on page 838)*

XML Parser Preferences

To configure the **XML Parser** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XML Parser**.

The configurable options of the built-in XML parser are as follows:

Enable parser caching (validation and content completion)

Enables re-use of internal models when validating and provides content completion in open XML files that reference the same schemas (grammars) such as DTD, XML Schema, or RelaxNG.

Enable system parameter entity expansion in other entity definitions

This security setting controls the expansion of the DTD system parameter entities (the ones that are loaded from disk or from remote sources). This option is off by default, to protect against XXE attacks. If you enable it, make sure the XML files you are opening or processing with the application come from a trusted source.

Ignore the DTD for validation if a schema is specified

Forces validation against a referenced schema (XML Schema, Relax NG schema) even if the document includes also a DTD DOCTYPE declaration. This option is useful when the DTD declaration is used only to declare DTD entities and the schema reference is used for validation against an XML Schema or a Relax NG schema.

Note:
Schematron schemas are treated as additional schemas. The validation of a document associated with a DTD and referencing a Schematron schema is executed against both the DTD and the Schematron schema, regardless of the value of the **Ignore the DTD for validation if a schema is specified** option.

Enable XInclude processing

Enables XInclude processing. If selected, the XInclude support in Oxygen XML Editor is turned on for validation, rendering in **Author** mode and transformation of XML documents.

Base URI fix-up

According to the specification for XInclude, processors must add an `@xml:base` attribute to elements included from locations with a different base URI. Without these attributes, the resulting infoset information would be incorrect.

Unfortunately, these attributes make XInclude processing to not be transparent to Schema validation. One solution to this is to modify your schema to allow `@xml:base` attributes to appear on elements that might be included from different base URIs.

If the addition of `@xml:base` and / or `@xml:lang` is not desired by your application, you can deselect this option.

Language fix-up

The processor will preserve language information on a top-level included element by adding an `@xml:lang` attribute if its included parent has a different [language] property. If the addition of `@xml:lang` is not allowed by your application, you can deselect this option.

DTD post-validation

Select this option to validate an XML file against the associated DTD, after all the content merged to the current XML file using *XInclude* was resolved. If you deselect this option, the current XML file is validated against the associated DTD before all the content merged to the current XML file using *XInclude* is resolved.

XML Schema Preferences

To configure options regarding XML Schema, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XML Parser > XML Schema**.

This preferences page allows you to configure the following options:

Default XML Schema version

Allows you to select the version of XML Schema to be used as the default. You can choose XML Schema **1.0** or XML Schema **1.1**.

Note:
You are also able to set the XML Schema version using the **Customize** option in the **New** document wizard *(on page 377)*.

Default XML Schema validation engine

Allows you to select the default validation engine to be used for XML Schema. You can choose **Xerces** or **Saxon EE**.

Xerces validation features section

Enable full schema constraint checking

Sets the *schema-full-checking* feature to `true`. This enables a validation of the parsed XML document against a schema (XML Schema or DTD) while the document is parsed.

Enable honour all schema location feature

Sets the *honour-all-schema-location* feature to `true`. All the files that declare XML Schema components from the same namespace are used to compose the validation model. If this option is not selected, only the first XML Schema file that is encountered in the XML Schema import tree is taken into account.

Enable full XPath 2.0 for alternative types

When selected (default value), you can use the full XPath support in assertions and alternative types. Otherwise, only the XPath support offered by the Xerces engine is available.

Assertions can see comments and processing instructions

Controls whether or not comments and processing instructions are visible to the XPath expression used for defining an assertion in XSD 1.1.

Saxon EE validation features section

Multiple schema imports

Forces `<xs:import>` to fetch the referenced schema document. By default, the `<xs:import>` fetches the document only if no schema document for the given namespace has already been loaded. With this option in effect, the referenced schema document is loaded unless the absolute URI is the same as a schema document already loaded.

Assertions can see comments and processing instructions

Controls whether or not comments and processing instructions are visible to the XPath expression used to define an assertion. By default, they are not made visible (unlike Saxon 9.3).

Relax NG Preferences

To configure options regarding Relax NG, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XML Parser > Relax NG**.

The following options are available in this page:

Check feasibly valid

Checks if Relax NG documents can be transformed into valid documents by inserting any number of attributes and child elements anywhere in the tree.

Note:
Selecting this option disables the **Check ID/IDREF** option.

Check ID/IDREF

Checks the ID/IDREF matches when a Relax NG document is validated.

Add default attribute values

Default values are given to the attributes of documents validated using Relax NG. These values are defined in the Relax NG schema.

Ignore "data-" attributes in XHTML

This option is selected by default, which means that when XHTML documents are validated with an RNG schema, any **data-** attributes detected in the document will not be taken into account by the validation engine.

Schematron Preferences

To configure options regarding Schematron, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XML Parser > Schematron**.

The following options are available in this preferences page:

ISO Schematron Section

Optimize (visit-no-attributes)

If your ISO Schematron assertion tests do not contain the attributes axis, you should select this option for faster ISO Schematron validation.

Allow foreign elements (allow-foreign)

Enables support for `allow-foreign` on ISO Schematron. This option is used to pass non-Schematron elements to the generated stylesheet.

Use associated XML Schema to expand default attribute values

When selected (default value), if the validated XML document has an XML Schema associated that contains default values for attributes defined in the XML content, the Schematron will be able to match on those default attributes.

Use Saxon EE (schema aware) for xslt2/xslt3 query language binding

When selected, Saxon EE is used for `xslt2`/`xslt3` query binding. If this option is not selected, Saxon PE is used.

Enable Schematron Quick Fixes (SQF) support

Allows you to enable or disable the support for *Quick Fixes (on page 3423)* in Schematron files. This option is selected by default.

Embedded rules query language binding

You can control the query language binding used by the ISO Schematron embedded rules. You can choose between: **xslt1**, **xslt2**, or **xslt3**.

Note:
To control the query language binding for standalone ISO Schematron, you need to set the query language to be used with a `@queryBinding` attribute on the schema root element.

Message language

This option allows you to specify the language to be used in Schematron validation messages. You can choose between the following:

- **Use the language defined in the application** - The language that is specified in the **Global Preferences** page *(on page 133)* will be used and only the validation messages that match that language will be presented. You can use the **Change application language** link to navigate to the preferences page where you can specify the language to be used in the application.
- **Use the "xml:lang" attribute set on the Schematron root** - The language specified in the `@xml:lang` attribute from the Schematron root will be used and only the validation message that match that language will be presented.
- **Ignore the language and show all message** - All messages are displayed in whatever language is defined within the Schematron schema.
- **Custom** - Use this option to specify a custom language to be used and only the messages that match the specified language will be presented.

Note:
In all cases, if the selected language is not available for a validation error or warning, all messages will be displayed in whatever language is defined within the Schematron schema.

Schematron 1.5 Section

XPath Version

Allows you to select the version of XPath for the expressions that are allowed in Schematron assertion tests. You can choose between: **1.0**, **2.0**, or **3.0**. This option is applied in both standalone Schematron 1.5 schemas and embedded Schematron 1.5 rules.

Security

Disable Schematron security checks

For security reasons, several security checks are performed on Schematron files that are not located inside a *framework (on page 3420)* or *plugin (on page 3422)*. Select this option if your Schematron files are failing because of these security checks and you are unable to move them to a location recognized as safe (a framework or a plugin).

Sample XML Files Generator Preferences

The **Generate Sample XML Files** tool *(on page 1019)* (available on the **Tools** menu) allows you to generate XML instance documents based on an XML Schema. There are various options that can be configured within the tool and these options are also available in the **Sample XML Files Generator** preferences page. This allows you to set default values for these options. To configure the options for generating the XML files, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > Sample XML Files Generator**.

The following options are available:

Generate optional elements

When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

Generate optional attributes

When selected, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending on the data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the **Sample XML Files Generator** preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an **xs:string** with the **xs:maxLength** facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending on the data type descriptor of the particular element or attribute.

Important:
If all of the following are true, the **Generate Sample XML Files** tool outputs invalid values:
  - At least one of the restrictions is a `regexp`.
  - The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the `<xs:alternative>` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

Choice strategy

Used for `<xs:choice>` or `<substitutionGroup>` elements. The possible strategies are:

- **First** - The first branch of `<xs:choice>` or the head element of `<substitutionGroup>` is always used.
- **Random** - A random branch of `<xs:choice>` or a substitute element or the head element of a `<substitutionGroup>` is used.

Generate the other options as comments

If selected, generates the other possible choices or substitutions (for `<xs:choice>` and `<substitutionGroup>`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Use incremental attribute / element names as default

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `<a>` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Related information

Generating Sample XML Files *(on page 1019)*

XProc Preferences

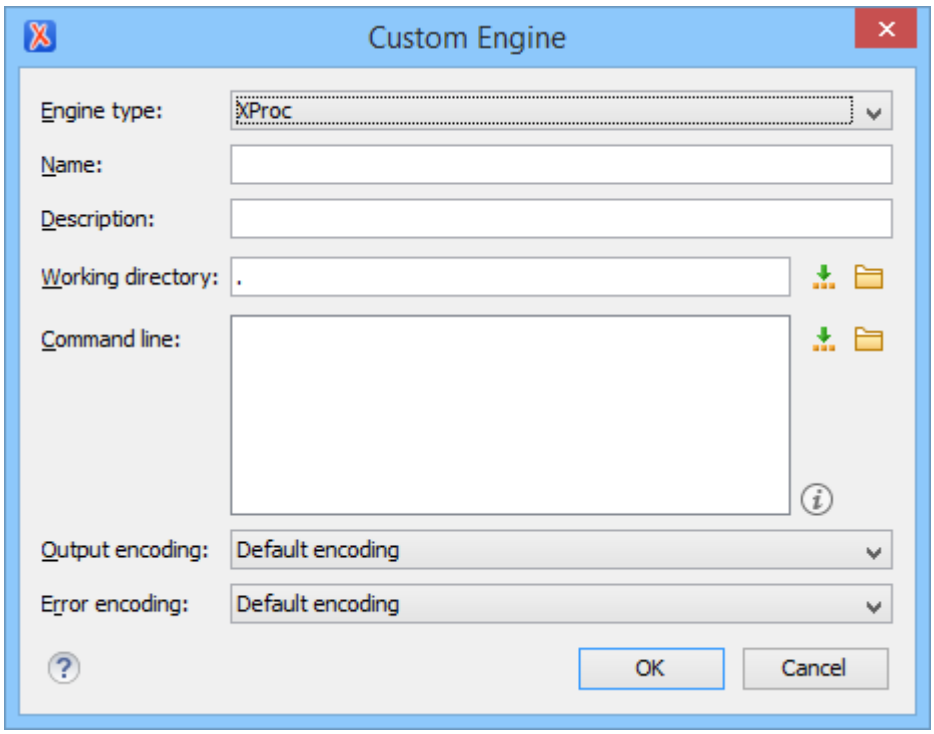
Oxygen XML Editor includes a bundled version of the *Calabash* XProc engine that can be used for XProc transformations and validation, but you also have several ways to integrate other external XProc engines.

If the external engine is Java-based, or it has validation support, or it can receive parameters or ports passed from the transformation, you need to integrate the external XProc engine using a plugin extension procedure *(on page 1587)*.

If you do not need the engine to be used for automatic validation or pass parameters/ports and it is not Java-based, you can add an external XProc engine by using the **XProc** preferences page. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XProc**.

To add an external engine, click the **New** button. To configure an existing engine, click the **Edit** button. This opens the **Custom Engine** dialog box that allows you to configure an external engine.

Figure 30. Creating an XProc external engine



The following options can be configure in this custom engine configuration dialog box:

- **Name** - The value of this field will be displayed in the XProc transformation scenario and in the command line that will start it.
- **Description** - A textual description that will appear as a tooltip where the XProc engine will be used.
- **Working directory** - The working directory for resolving relative paths. You can specify the path by using the text field, the **Insert Editor Variables** *(on page 332)* button, or the **Browse** button.
- **Command line** - The command line that will run the XProc engine as an external process. You can specify the path by using the text field, the **Insert Editor Variables** *(on page 332)* button, or the **Browse** button.
- **Output encoding** - The encoding for the output stream of the XProc engine, used for reading and displaying the output messages.
- **Error encoding** - The encoding for the error stream of the XProc engine, used for reading and displaying the messages from the error stream.

Note:
You can configure the built-in Calabash processor by using the `calabash.config` file. This file is located in *`[OXYGEN_INSTALL_DIR]`*`\lib\xproc\calabash\lib`. If that file does not exist, you have to create it.

The **Show XProc messages** option at the bottom of the **XProc** preferences page can be selected if you want all messages emitted by the XProc processor during a transformation to be presented in dedicated XProc **Results** view *(on page 558)*.

XSLT/XQuery Preferences

To configure options regarding XSLT and XQuery processors, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery**. This panel contains only the most generic options for working with XSLT or XQuery processors. The more specific options are grouped in other panels linked as child nodes of this panel in the tree of this **Preferences** page.

There is only one generic option available:

Create transformation temporary files in system temporary directory

It should be selected only when the temporary files necessary for performing transformations are created in the same folder as the source of the transformation (the default behavior when this option is not selected) and this breaks the transformation. An example of breaking the transformation is when the transformation processes all the files located in the same folder as the source of the transformation (including the temporary files) and the result is incorrect or the transformation fails because of this.

XSLT Preferences

To configure the **XSLT** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery > XSLT**.

The XSLT preferences page allows you to customize options for the default XSLT validation engines. You can also specify the engine directly in a validation scenario *(on page 809)*.

Note:
If no specific engine is specified in the validation scenario and the XSLT file has a transformation scenario associated, Oxygen XML Editor will use the engine specified in the transformation scenario.

The following options are available in this page:

Validation engine - XSLT 1.0

Allows you to select the XSLT engine to be used for validation of XSLT 1.0 documents.

Validation engine - XSLT 2.0

Allows you to select the XSLT engine to be used for validation of XSLT 2.0 documents.

Validation engine - XSLT 3.0

Allows you to select the XSLT engine to be used for validation of XSLT 3.0 documents.

> **Note:**
> Saxon-HE does not implement any XSLT 3.0 features. Saxon-PE implements a selection of XSLT 3.0 (and XPath 3.1) features, with the exception of schema-awareness and streaming. Saxon-EE implements additional features relating to streaming (processing of a source document without constructing a tree in memory. For further details about XSLT 3.0 conformance, go to http://www.saxonica.com/documentation/index.html#!conformance/xslt30.

XSLT Editor Content Completion Options link

Use this link to switch to the **XSLT Content Completion** preferences page *(on page 221)*, where you can configure the XSLT content completion options.

Saxon6 Preferences

To configure the **Saxon 6** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery > XSLT > Saxon > Saxon6**.

The built-in Saxon 6 XSLT processor can be configured with the following options:

- **Line numbering** - Specifies whether or not line numbers are maintained and reported in error messages for the XML source document.
- **Disable calls on extension functions** - If selected, external function calls are not allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, since they carry similar security risks.
- **Handling of recoverable stylesheet errors** - Allows you to choose how dynamic errors are handled. One of the following options can be selected:
  - **recover silently** - Continue processing without reporting the error.
  - **recover with warnings** - Issue a warning but continue processing.
  - **signal the error and do not attempt recovery** - Issue an error and stop processing.

Saxon-HE/PE/EE Preferences

To configure global options for XSLT transformation and validation scenarios that use the **Saxon HE/PE/EE** engine, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery > XSLT > Saxon > Saxon-HE/PE/EE**.

Saxon-HE/PE/EE Options

Oxygen XML Editor allows you to configure the following XSLT options for the Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

Use a configuration file ("-config")

Select this option if you want to use a Saxon 12.3 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the **URL** field, or by using the **Insert Editor Variables** button, or using the browsing actions in the **Browse** drop-down list.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the XSLT Debugger *(on page 2236)* to *step into* XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

> **Note:**
> Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source

document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Saxon-PE/EE Options

The following options are available for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-JS extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 12.3 processors.

Note:
Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The options available specifically for Saxon 12.3 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Saxon-HE/PE/EE Advanced Preferences

To configure the **Saxon HE/PE/EE Advanced** preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery > XSLT > Saxon > Saxon-HE/PE/EE > Advanced**.

You can configure the following advanced XSLT options for the Saxon 12.3 transformer (all three editions: Home Edition, Professional Edition, Enterprise Edition):

- **URI Resolver class name ("-r")** - Specifies a custom implementation for the URI resolver used by the XSLT Saxon 12.3 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding `jar` or `class` extension must be configured from the dialog box for configuring the XSLT extension *(on page 1508)* for the particular transformation scenario.
- **Collection URI Resolver class name ("-cr")** - Specifies a custom implementation for the Collection URI resolver used by the XSLT Saxon 12.3 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding `jar` or `class` extension must be configured from the dialog box for configuring the XSLT extension *(on page 1508)* for the particular transformation scenario.

XSLTProc Preferences (Deprecated)

To configure **XSLTProc** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery > XSLT > XSLTProc**.

The following options are available in this preferences page:

- **Enable XInclude processing** - If selected, XInclude references will be resolved when XSLTProc is used as transformer in XSLT transformation scenarios *(on page 1470)*.
- **Skip loading the document's DTD** - If selected, the DTD specified in the DOCTYPE declaration will not be loaded.

- **Do not apply default attributes from document's DTD** - If selected, the default attributes declared in the DTD and not specified in the document are not included in the transformed document.
- **Do not use Internet to fetch DTD's, entities or docs** - If selected, the remote references to DTD's and entities are not followed.
- **Maximum depth in templates stack** - If this limit of maximum templates depth is reached the transformation ends with an error.
- **Verbosity** - If selected, the transformation will output detailed status messages about the transformation process in the **Warnings** view.
- **Show version of libxml and libxslt used** - If selected, Oxygen XML Editor will display in the **Warnings** view the version of the **libxml** and **libxslt** libraries invoked by XSLTProc.
- **Show time information** - If selected, the **Warnings** view will display the time necessary for running the transformation.
- **Show debug information** - If selected, the **Warnings** view will display debug information about what templates are matched, parameter values, and so on.
- **Show all documents loaded during processing** - If selected, Oxygen XML Editor will display in the **Warnings** view the URL of all the files loaded during transformation.
- **Show profile information** - If selected, Oxygen XML Editor will display in the **Warnings** view a table with all the matched templates, and for each template will display: the match XPath expression, the template name, the number of template modes, the number of calls, the execution time.
- **Show the list of registered extensions** - If selected, Oxygen XML Editor will display in the **Warnings** view a list with all the registered extension functions, extension elements and extension modules.
- **Refuses to write to any file or resource** - If selected, the XSLTProc processor will not write any part of the transformation result to an external file on disk. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.
- **Refuses to create directories** - If selected, the XSLTProc processor will not create any directory during the transformation process. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.

MSXML Preferences (Deprecated)

To configure the MSXML options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery > XSLT > MSXML (Legacy)**.

The options in this preferences page for the MSXML 3.0 and 4.0 processors are as follows:

Validate documents during parse phase

If selected, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

Do not resolve external definitions during parse phase

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is selected, the resolution is disabled.

Strip non-significant whitespaces

If selected, strips non-significant white space from the input XML document during the load phase. Selecting this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

Show time information

If selected, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

Start transformation in this mode

Although stylesheet execution usually begins in the empty mode, this default behavior may be changed by specifying another mode. Changing the start mode allows execution to jump directly to an alternate group of templates.

MSXML.NET Preferences (Deprecated)

To configure the **MSXML.NET** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery > XSLT > MSXML.NET (Legacy)**.

The options in this preferences page for the MSXML.NET processor are as follows:

Enable XInclude processing

If selected, XInclude references will be resolved when MSXML.NET is used as the transformer in the XSLT transformation scenario *(on page 1470)*.

Validate documents during parse phase

If selected, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

Do not resolve external definitions during parse phase

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is selected, the resolution is disabled.

Strip non-significant whitespaces

If selected, strips non-significant white space from the input XML document during the load phase. Selecting this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

Show time information

If selected, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

Forces ASCII output encoding

There is a known problem with the .NET 1.X XSLT processor (`System.Xml.Xsl.XslTransform` class). It does not support escaping of characters as XML character references when they cannot be represented in the output encoding. This means that it will be outputted as `'?'`. Usually this happens when output encoding is set to ASCII. If this option is selected, the output is forced to be ASCII encoded and all non-ASCII characters get escaped as XML character references (`&#nnnn;` form).

Allow multiple output documents

This option allows you to create multiple result documents using the `exsl:document` extension element.

Use named URI resolver class

This option allows you to specify a custom URI resolver class to resolve URI references in `<xsl:import>` and `<xsl:include>` instructions (during XSLT stylesheet loading phase) and in `document()` functions (during XSL transformation phase).

Assembly file name for URI resolver class

This option specifies a file name of the assembly where the specified resolver class can be found. The **Use named URI resolver class** option *(on page 261)* specifies a partially or fully qualified URI resolver class name (for example, `Acme.Resolvers.CacheResolver`). Such a name requires additional assembly specification using this option or the **Assembly GAC name for URI resolver class** option *(on page 261)*, but fully qualified class name (which always includes an assembly specifier) is *all-sufficient*.

Assembly GAC name for URI resolver class

This option specifies partially or fully qualified name of the assembly in the global assembly cache (GAC) where the specified resolver class can be found.

List of extension object class names

This option allows to specify extension object classes, whose public methods then can be used as extension functions in an XSLT stylesheet. It is a comma-separated list of namespace-qualified extension object class names. Each class name must be bound to a namespace URI using prefixes, similar to providing XSLT parameters.

Use specified EXSLT assembly

MSXML.NET supports a rich library of the EXSLT and EXSLT.NET extension functions embedded or in a *plugin* EXSLT.NET library. EXSLT support is enabled by default and cannot be disabled in this version. Use this option if you want to use an external EXSLT.NET implementation instead of a built-in one.

Credential loading source xml

This option allows you to specify user credentials to be used when loading XML source documents. The credentials should be provided in the `username:password@domain` format (all parts are optional).

Credential loading stylesheet

This option allows you to specify user credentials to be used when loading XSLT stylesheet documents. The credentials should be provided in the `username:password@domain` format (all parts are optional).

XQuery Preferences

To configure the **XQuery** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery > XQuery**.

The following generic XQuery preferences are available:

Validation engine

Allows you to select the processor that will be used to validate XQuery documents. If you are validating an XQuery file that has an associated validation scenario, Oxygen XML Editor uses the processor specified in the scenario. If no validation scenario is associated, but the file has an associated transformation scenario, the processor specified in the scenario is used. If the processor does not support validation or if no scenario is associated, then the value from this combo box will be used as validation processor.

Size limit of Sequence view (MB)

When the result of an XQuery transformation is set as a sequence (**Present as a sequence** option *(on page 1526)*) in the transformation scenario, the size of one chunk of the result that is fetched from the database in lazy mode in one step is set in this option. If this limit is exceeded, go to the **Sequence** view *(on page 1059)* and click **More results available** to extract more data from the database.

Format transformer output

Specifies whether or not the output of the transformer is formatted and indented (*pretty-print (on page 3422)*).

> **Note:**
> This option is ignored if you choose **Present as a sequence** *(on page 1526)* (lazy extract data from a database) from the associated transformation scenario.

Create structure indicating the type nodes

If selected, Oxygen XML Editor takes the results of a query and creates an XML document containing copies of all items in the sequence, suitably wrapped.

Note:
This option is ignored if you choose **Present as a sequence** *(on page 1526)* (lazy extract data from a database) from the associated transformation scenario.

Saxon-HE/PE/EE Preferences

To configure global options for XQuery transformation and validation scenarios that use the **Saxon HE/PE/EE** engine, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery > XQuery > Saxon-HE/PE/EE**.

Oxygen XML Editor allows you to configure the following XQuery options for the Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

Use a configuration file ("-config")

Sets a Saxon 12.3 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

The following option is available for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The options available specifically for Saxon 12.3 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

Saxon HE/PE/EE Advanced Preferences

To configure **Saxon HE/PE/EE Advanced** preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery > XQuery > Saxon-HE/PE/EE > Advanced**.

The advanced XQuery options that can be configured for the Saxon 12.3 XQuery transformer (all editions: Home Edition, Professional Edition, Enterprise Edition) are as follows:

- **URI Resolver class name** - Allows you to specify a custom implementation for the URI resolver used by the XQuery Saxon 12.3 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding *JAR* or class extension must be configured from the dialog box for configuring the XQuery extension *(on page 1508)* for the particular transformation scenario.

Note:
If your `URIResolver` implementation does not recognize the given resource, the `resolve(String href, String base)` method should return a `null` value. Otherwise, the given resource will not be resolved through the *XML Catalog (on page 838)*.

- **Collection URI Resolver class name** - Allows you to specify a custom implementation for the Collection URI resolver used by the XQuery Saxon 12.3 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding *JAR* or class extension must be configured from the dialog box for configuring the XQuery extension *(on page 1508)* for the particular transformation scenario.

Debugger Preferences

To configure the **Debugger** preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery > Debugger**.

The following options are available:

Show xsl:result-document output

If selected, the debugger presents the output of `<xsl:result-document>` instructions into the debugger output view.

Infinite loop detection

Select this option to receive notifications when an infinite loop occurs during transformation.

Enable Saxon optimizations

This option is not selected by default and this means that the optimization for the debugging process is suppressed. This is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Maximum depth in templates stack

Allows you to set how many `<xsl:template>` instructions can appear on the current stack. This setting is used by the infinite loop detection.

Debugger layout

If you select the **Horizontal** layout, the stack of XML editors is presented on the left half of the editing area while the stack of XSL editors is on the right half. If you select the **Vertical** layout, the stack of XML editors is presented on the upper half of the editing area while the stack of XSL editors is on the lower half.

Debugger current instruction pointer

Allows you to set the background color of the current execution node, both in the document (XML) and XSLT/XQuery views.

XWatch evaluation timeout (seconds)

Allows you to specify the maximum time that Oxygen XML Editor allocates to the evaluation of XPath expressions while debugging.

Messages

Allows you to specify how to handle the debugging process when the source document involved in a debugging session is edited. You can choose one of the following:

- **Ask me what to do**
- **Always stop the debugging session**
- **Never stop the debugging session**

Profiler Preferences

This section explains the settings available for the XSLT/XQuery Profiler. To access and modify these settings, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery > Profiler** (see Debugger Preferences *(on page 265)*).

The following profiler settings are available:

Show time

Shows the total time that was spent in the call.

Show inherent time

Shows the inherent time that was spent in the call. The inherent time is defined as the total time of a call minus the time of its child calls.

Show invocation count

Shows how many times the call was called in this particular call sequence.

Time scale

Determines the unit of time measurement. You can choose between milliseconds or microseconds.

Hotspot threshold

Hotspots are ignored below this specified amount (in milliseconds). For more information, see Hotspots View *(on page 2244)*.

Ignore invocation less than

Invocations are ignored below this specified amount (in microseconds). For more information, see Invocation Tree View *(on page 2243)*.

Percentage calculation

The percentage base that determines what time span percentages are calculated against. You can choose between the following:

- **Absolute** - Percentage values show the contribution to the total time.
- **Relative** - Percentage values show the contribution to the calling call.

XPath Preferences

To configure XPath options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery > XPath**.

Oxygen XML Editor allows you to customize the following options:

Unescape XPath expression

If selected, the entities of an XPath expression that you type in the **XPath/XQuery Builder** *(on page 2120)* and the XPath toolbar *(on page 2118)* are unescaped during their execution. For example, the expression:

```
//varlistentry[starts-with(@os,'&#x73;')]
```

is equivalent to:

```
//varlistentry[starts-with(@os,'s')]
```

Multiple XPath results

Select this option to display the results of an XPath expression in separate tabs in the **Results** view *(on page 558)*.

XPath Default Namespace (only for XPath version 2.0)

Specifies the default namespace to be used for unprefixed element names. You can choose between the following four options:

- **No namespace** - If selected, Oxygen XML Editor considers unprefixed element names of the evaluated XPath expressions as belonging to no namespace.
- **Use the default namespace from the root element** (default selection) - Oxygen XML Editor considers unprefixed element names of the evaluated XPath expressions as belonging to the default namespace declared on the root element of the XML document you are querying.
- **Use the namespace of the root** - If selected, Oxygen XML Editor considers unprefixed element names of the evaluated XPath expressions as belonging to the same namespace as the root element of the XML document you are querying.
- **This namespace** - If selected, you can use the corresponding text field to enter the namespace of the unprefixed elements.

Default prefix-namespace mappings

You can use this table to associate prefixes with namespaces. Use these mappings when you want to define them globally (not for each document). Use the **New** button to add mappings to the list and the **Delete** button to remove mappings.

Custom Engines Preferences

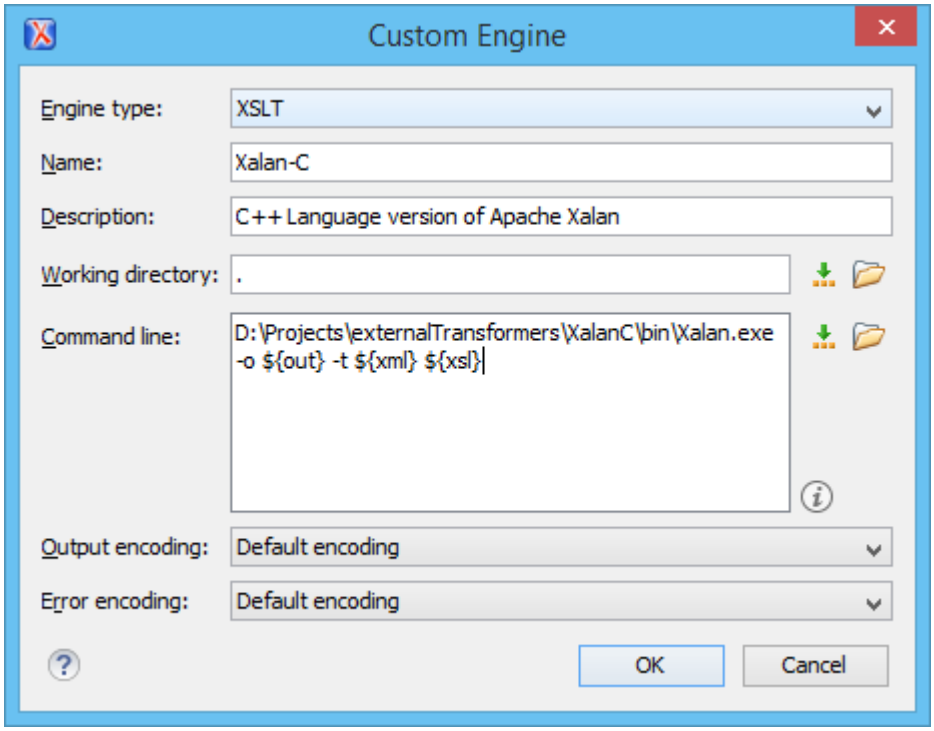
Oxygen XML Editor allows you to configure custom processors to be used for running XSLT and XQuery transformations.

Note:
You can not use these custom engines in the Debugger *perspective (on page 2217)*.

To configure the **Custom Engines** preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT-XQuery > Custom Engines**.

The table in this preferences page displays the custom engines that have been defined. Use the **New** or **Edit** button at the bottom of the table to open a dialog box that allows you to add or configure a custom engine.

Figure 31. Parameters of a Custom Engine



The following parameters can be configured for a custom engine:

Engine type

Specifies the transformer type. You can choose between XSLT and XQuery engines.

Name

The name of the transformer displayed in the dialog box for editing transformation scenarios.

Description

A textual description of the transformer.

Working directory

The start directory of the executable program for the transformer. The following editor variables *(on page 332)* are available for making the path to the working directory independent of the location of the input files:

- **${homeDir}** - The user home directory in the operating system.
- **${cfd}** - The path to the directory of the current file.
- **${pd}** - The path to the directory of the current project.
- **${oxygenInstallDir}** - The Oxygen XML Editor install directory.

Command line

The command line that must be executed by Oxygen XML Editor to perform a transformation with the engine. The following editor variables *(on page 332)* are available for making the parameters in the command line (the transformer executable, the input files) independent of the location of the input files:

- **${xml}** - The XML input document as a file path.
- **${xmlu}** - The XML input document as a URL.
- **${xsl}** - The XSL / XQuery input document as a file path.
- **${xslu}** - The XSL / XQuery input document as a URL.
- **${out}** - The output document as a file path.
- **${outu}** - The output document as a URL.
- **${ps}** - The platform separator that is used between library file names specified in the class path.

Output Encoding

The encoding of the transformer output stream.

Error Encoding

The encoding of the transformer error stream.

PDF Output Preferences

The **PDF Output** preferences page simply includes links to sub-pages for configuring PDF output options.

FO Processors Preferences

Oxygen XML Editor includes a built-in formatting objects processor (Apache FOP), but you can also configure other external processors and use them in the transformation scenarios for processing XSL-FO documents.

Oxygen XML Editor provides an easy way to add two of the most commonly used commercial FO processors: **RenderX XEP** and **Antenna House Formatter**. You can easily add *RenderX XEP* as an external FO processor if you have the XEP installed. Also, if you have the *Antenna House Formatter*, Oxygen XML Editor uses the environment variables set by the XSL formatter installation to detect and use it for XSL-FO transformations. If the environment variables are not set for the XSL formatter installation, you can browse and choose

the executable file just as you would for XEP. You can use these two external FO processors for DITA-OT transformations scenarios *(on page 1530)* and XML with XSLT transformation scenarios *(on page 1504)*.

To configure the options for the FO processors, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > PDF Output > FO Processors**. This preferences page includes the following options:

Apache FOP Section

In this section, you can configure options for the built-in Apache processor. The following options are available:

Use built-in Apache FOP

Instructs Oxygen XML Editor to use the built-in Apache FO processor. To see the version of the built-in XSL-FO processor for your installation, go to **Help > About > Libraries** and search for *Apache FOP*.

Use other Apache FOP

Instructs Oxygen XML Editor to use another Apache FO processor that is installed on your computer. You can specify the path by using the text field, the **Insert Editor Variables** *(on page 332)* button, or the **Browse** button.

Enable the output of the built-in FOP

All Apache FOP output is displayed in a results pane at the bottom of the Oxygen XML Editor window, including warning messages about FO instructions not supported by Apache FOP.

Memory available to the Apache FOP

If your Apache FOP transformations fail with an Out of Memory error (**OutOfMemoryError**), use this combo box to select a larger value for the amount of memory reserved for Apache FOP transformations.

Configuration file for the built-in FOP

Use this option to specify the path to an Apache FOP configuration file (for example, to render to PDF a document containing Unicode content using a special *true type* font). You can specify the path by using the text field, the **Insert Editor Variables** *(on page 332)* button, or the **Browse** button.

Generates PDF/A-1b output

When selected, PDF/A-1b output is generated.

Notes:

- All fonts have to be embedded, even the implicit ones. More information about configuring metrics files for the embedded fonts can be found in Add a font to the built-in FOP *(on page 1574)*.
- You cannot use the `<filterList>` key in the configuration file since the FOP would generate the following error: *The Filter key is prohibited when PDF/A-1 is active*.

External FO Processors Section

In this section, you can manage the external FO processors you want to use in transformation scenarios. You can use the two options at the bottom of the section to use the **RenderX XEP** or **Antenna House Formatter** commercial FO processors.

Add 'XEP' FO processor (executable file is needed)

If **RenderX XEP** is already installed on your computer, you can use this button to choose the XEP executable script (`xep.bat` for Windows, `xep` for Linux).

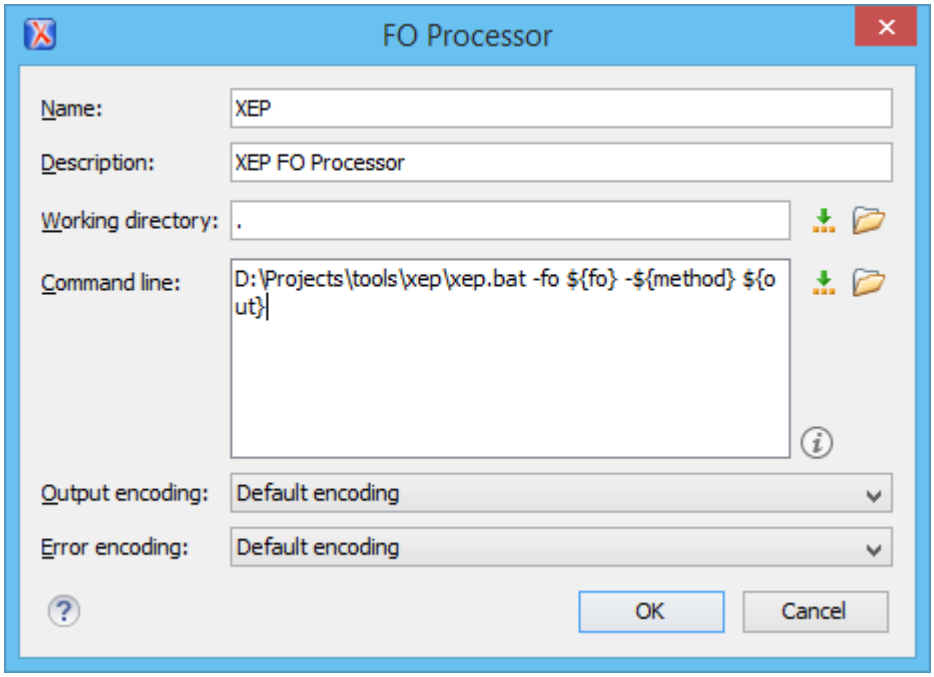
Add 'Antenna House' FO processor (executable file is needed)

If **Antenna House Formatter** is already installed on your computer, you can use this button to choose the Antenna House executable script (`AHFCmd.exe` or `XSLCmd.exe` for Windows, and `run.sh` for Linux/macOS).

Note:
The built-in **Antenna House Formatter GUI** transformation scenario requires that you configure an external FO processor that runs `AHFormatter.exe` (Windows only). In the external **FO Processor** configuration dialog box *(on page 272)*, you could use `"${env(AHF63_64_HOME)}\AHFormatter.exe" -d ${fo} -s` for the value in the **Command line** field, although the environment variable name changes for each version of the AH Formatter and for each system architecture (you can install multiple versions side-by-side). For more information, see https://github.com/AntennaHouse/focheck/wiki/focheck.

You can also add external processors or configure existing ones. Click the **New** button to open a configuration dialog box that allows you to add a new external FO processor. Use the other buttons (**Edit**, **Duplicate**, **Delete**, **Up**, **Down**) to configure existing external processors.

Figure 32. External FO Processor Configuration Dialog Box



The external **FO Processor** configuration dialog box includes the following options:

Name

The name that will be displayed in the list of available FO processors on the FOP tab of the transformation scenario dialog box.

Description

A textual description of the FO processor that will be displayed in the FO processors table and in tooltips of UI components where the processor is selected.

Working directory

The directory where the intermediate and final results of the processing are stored. You can specify the path by using the text field, the **Insert Editor Variables** *(on page 332)* button, or the **Browse** button. You can use one of the following editor variables *(on page 332)*:

- **${homeDir}** - The path to the user home directory.
- **${cfd}** - The path of the current file directory. If the current file is not a local file, the target is the user desktop directory.
- **${pd}** - The project directory.
- **${oxygenInstallDir}** -The Oxygen XML Editor installation directory.

Command line

The command line that starts the FO processor, specific to each processor. You can specify the path by using the text field, the **Insert Editor Variables** *(on page 332)* button, or the **Browse** button. You can use one of the following editor variables *(on page 332)*:

- **${method}** - The FOP transformation method: **pdf**, **ps**, or **txt**.
- **${fo}** - The input FO file.
- **${out}** - The output file.
- **${pd}** - The project directory.
- **${frameworksDir}** - The path of the `frameworks` subdirectory of the Oxygen XML Editor installation directory.
- **${oxygenInstallDir}** - The Oxygen XML Editor installation directory.
- **${ps}** - The platform-specific path separator. It is used between the library files specified in the class path of the command line.

Output Encoding

The encoding of the FO processor output stream that is displayed in a **Results** panel *(on page 558)* at the bottom of the Oxygen XML Editor window.

Error Encoding

The encoding of the FO processor error stream that is displayed in a **Results** panel *(on page 558)* at the bottom of the Oxygen XML Editor window.

CSS-based Processors Preferences

Oxygen XML Editor includes a built-in **XML to PDF transformation with CSS** scenario type for generating PDF output using a CSS-based processor.

To configure the options for the CSS-based processors, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > PDF Output > CSS-based Processors**. This preferences page includes the following options:

Oxygen PDF Chemistry Section

Auto-detect

If selected, the directory of the **Chemistry** processor will be automatically detected. This is based on the system's PATH environmental variable. If none is detected, it will use the path of the built-in distribution.

Custom installation directory

Use this option to select an external directory of a custom installation of the **Chemistry** processor.

Memory available to the processor (MB)

Specifies the maximum amount of memory that is available for the transformation. If your transformations fail with an Out of Memory error (**OutOfMemoryError**), you can use this option to select a bigger value for the amount of memory reserved for the process.

Generates PDF/UA-1 output

Use this option to produce output that conforms with the PDF/UA-1 accessibility standards.

> **Note:**
> This mode has some special requirements. For example, all fonts have to be embedded and the title of documents must be marked using the metadata. For more information, see Oxygen PDF Chemistry User Guide: Fully Accessible PDF (PDF/UA1).

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

Ant Preferences

To set Ant preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > Ant**. This panel allows you to choose the directory containing the *Apache Ant (on page 3417)* libraries (the so-called *Ant Home*) that Oxygen XML Editor uses to handle Ant build files.

There are two options available:

- **Built-in** - the path to the Ant distribution that comes bundled with Oxygen XML Editor installation kit.
- **Custom** - the path to an Ant distribution of your choice.

Import Preferences

To configure importing options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > Import**. This page allows you to configure how empty values and `null` values are handled when they are encountered in imported database tables or Excel sheets. Also you can configure the format of date / time values recognized in the imported database tables or Excel sheets.

The following options are available:

Create empty elements for empty values

If selected, an empty value from a database column or from a text file is imported as an empty element.

Create empty elements for null values

If selected, `null` values from a database column are imported as empty elements.

Escape XML content

Selected by default, this option instructs Oxygen XML Editor to escape the imported content to an XML-safe form.

Add annotations for generated XML Schema

If selected, the generated XML Schema contains an annotation for each of the imported table columns. The documentation inside the annotation tag contains the remarks of the database

columns (if available) and also information about the conversion between the column type and the generated XML Schema type.

Date / Time Format section

Specifies the format used for importing date and time values from Excel spreadsheets or database tables, and in the generated XML schemas. You can choose from the following format types:

- **Unformatted** - The date and time formats specific to the database are used for import. When importing data from Excel a string representation of date or time values are used. The type used in the generated XML Schema is `xs:string`.
- **XML Schema date format** - The XML Schema-specific format ISO8601 is used for imported date / time data (`yyyy-MM-dd'T'HH:mm:ss` for `datetime`, `yyyy-MM-dd` for `date` and `HH:mm:ss` for `time`). The types used in the generated XML Schema are `xs:datetime`, `xs:date` and `xs:time`.
- **Custom format** - If selected, you can define a custom format for timestamp, date, and time values or choose one of the predefined formats. A preview of the values is presented when a format is used. The type used in the generated XML Schema is `xs:string`.

Table 3. Pattern Letters

Letter	Date or Time Component	Presentation	Examples
G	Era designator	Text	AD
y	Year	Year	1996; 96
M	Month in year	Month	July; Jul; 07
w	Week in year	Number	27
W	Week in month	Number	2
D	Day in year	Number	189
d	Day in month	Number	10
F	Day of week in month	Number	2
E	Day in week	Text	Tuesday; Tue
a	Am / pm marker	Text	PM
H	Hour in day (0-23)	Number	0
k	Hour in day (1-24)	Number	24
K	Hour in am / pm (0-11)	Number	0
h	Hour in am / pm (1-12)	Number	12
m	Minute in hour	Number	30

Table 3. Pattern Letters (continued)

Letter	Date or Time Component	Presentation	Examples
s	Second in minute	Number	55
S	Millisecond	Number	978
z	Time zone	General time zone	PST; GMT-08:00
Z	Time zone	RFC 822 time zone	-0800

Pattern letters are usually repeated, as their number determines the exact presentation:

- **Text** - If the number of pattern letters is 4 or more, the full form is used. Otherwise, a short or abbreviated form is used if available.
- **Number** - The number of pattern letters is the minimum number of digits, and shorter numbers are zero-padded to this amount.
- **Year** - If the number of pattern letters is 2, the year is truncated to 2 digits. Otherwise, it is interpreted as a number.
- **Month** - If the number of pattern letters is 3 or more, the month is interpreted as text. Otherwise, it is interpreted as a number.

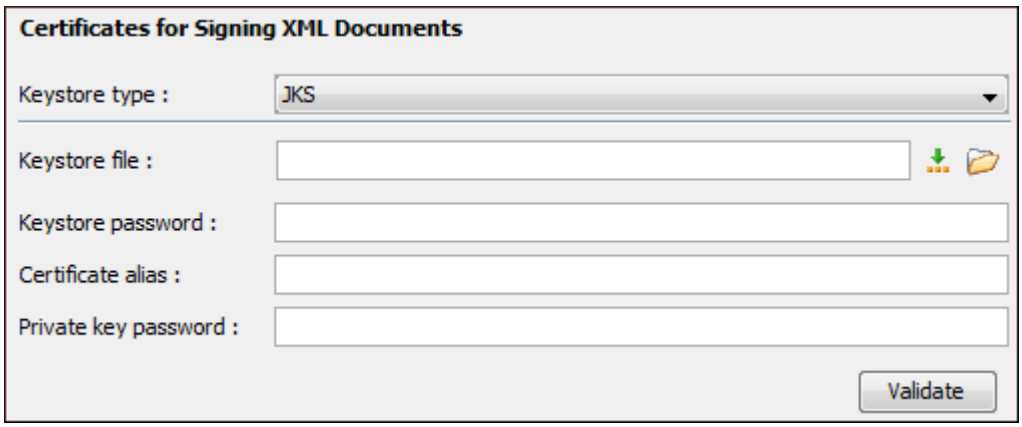
- **General time zone** - Time zones are interpreted as text if they have names. For time zones representing a GMT offset value, the following syntax is used:
  - **GMTOffsetTimeZone** - GMT Sign Hours: Minutes
  - **Sign** - one of + or -
  - **Hours** - one or two digits
  - **Minutes** - two digits
  - **Digit** - one of 0 1 2 3 4 5 6 7 8 9

  Hours must be between 0 and 23, and Minutes must be between 00 and 59. The format is locale independent and digits must be taken from the Basic Latin block of the Unicode standard.
- **RFC 822 time zone**: The RFC 822 4-digit time zone format is used:
  - **RFC822TimeZone**
  - **TwoDigitHours** (must be between 00 and 23)

XML Signing Certificates Preferences

Oxygen XML Editor provides two types of *keystores (on page 3421)* for certificates that are used for digital signatures of XML documents: Java Keystore (**JKS**) and Public-Key Cryptography Standards version 12 (**PKCS-12**). A *keystore* file is protected by a password. To configure a certificate *keystore*, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XML Signing Certificates**. You can customize the following parameters of a *keystore*:

Figure 33. Certificates Preferences Panel



- **Keystore type** - The type of *keystore (on page 3421)* that Oxygen XML Editor uses (**JKS** or **PKCS-12**).
- **Keystore file** - The location of the imported file.
- **Keystore password** - The password that is used for protecting the privacy of the stored keys.
- **Certificate alias** - The alias used for storing the key entry (the certificate or the private key) inside the *keystore (on page 3421)*.
- **Private key password** - The private key password of the certificate (required only for JKS *keystores (on page 3421)*).
- **Validate** - Click this button to verify the configured *keystore (on page 3421)* and the validity of the certificate.

XML Refactoring Preferences

To specify a folder for loading the custom XML refactoring operations, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XML Refactoring**. The following option is available in this preferences page:

Load additional refactoring operations from

Use this text box to specify a folder for loading custom XML refactoring operations. You can specify the path by using the text field, the **Insert Editor Variables** *(on page 332)* button, or the **Browse** button. Oxygen XML Editor looks for XML refactoring operations recursively in the specified folder, so they can be stored in descendant folders.

DITA Preferences

To access the DITA Preferences page, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **DITA**. This preferences page includes the following sections and options:

DITA Open Toolkit section

This section allows you to specify the default directory of the DITA Open Toolkit distribution (bundled with the Oxygen XML Editor installation) to be used for validating and publishing DITA content. You can select from the following:

Built-in Oxygen Publishing Engine (based on DITA-OT 4.x)

Oxygen XML Editor comes bundled with the **Oxygen Publishing Engine** (based on DITA-OT 4.1.2). By default, all defined DITA transformation/validation scenarios will run with this version. The default publishing engine directory is: *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/`*DITA-OT*.

Custom

Allows you to specify a custom directory for your DITA-OT distribution.

Location

You can either provide a new file path for the specific DITA-OT that you want to use or select a previously used one from the drop-down list. You can specify the path by using the text field, the  **Insert Editor Variables** *(on page 332)* button, or the  **Browse** button.

Important:
Using a custom DITA Open Toolkit may disable certain features in the application. Examples of features that may not work properly:

- If the custom DITA-OT is missing certain publishing plugins, default transformation scenarios such as DITA Map WebHelp Responsive *(on page 3264)* or DITA Map PDF - based on HTML5 & CSS *(on page 3278)* may no longer work properly.
- Validation of Markdown documents using Schematron may not work because it is based on a certain DITA Open Toolkit plugin.
- The DITA framework (defined in the **Preferences > Document Type Associations** page) will use the XML catalogs specified in the DITA-OT configured in the **Preferences > DITA** page to perform the validation of all DITA topic types. If this DITA-OT is different from the one that comes bundled with the Oxygen XML Editor default distribution, you might encounter validation-related issues.

CAUTION:
Oxygen XML Editor support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins. If you discover any issues or inconsistent behavior while using a custom DITA-OT or a DITA-OT that contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

Enable DITA 2.0 editing support (Experimental)

If selected, you will have access to a **DITA 2.0** folder in the New Document Wizard *(on page 377)* where you can find new document templates for creating DITA 2.0 maps or topics based on the DITA 2.0 standard DTDs. For example, in a DITA topic based on the DITA 2.0 DTDs, you can insert an `<include>` element that is not found in the DITA 1.3 DTDs.

DITA Maps Preferences

To access the *DITA Maps* preferences page, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **DITA > Maps**. This preferences page includes the following options:

DITA Maps file patterns

Allows you to specify the extension types that will be handled as *DITA maps* when opened in Oxygen XML Editor.

When opening a map

Oxygen XML Editor can open a *DITA map* in the regular editor view or in the **DITA Maps Manager** *(on page 3073)*. This option allows you to specify how a map will be opened. You can choose one of the following options:

- **Always open in the DITA Maps Manager** - A *DITA map* file is always opened in the **DITA Maps Manager** view.
- **Always open as XML** - A *DITA map* file is always opened in the XML editor.
- **Always ask** - When opening a *DITA map*, you are prompted to choose between opening it in the XML editor panel or in the **DITA Maps Manager** view.

Expand references to other maps when opening a map in Author mode

Enabling this option will improve performance (decrease the loading time) when opening maps in **Author** mode (particularly maps that contain a large amount of submaps). This option is disabled by default.

Note:
You must close and reopen the map to see the effects of enabling/disabling this option.

DITA Maps Manager section

Automatically save local DITA maps after each modification

If selected (default), local DITA maps that are edited in the **DITA Maps Manager** are automatically saved whenever a modification is made.

Warning:
This option is ignored if the **Validate document before saving** option *(on page 210)* in the **Editor > Save** preferences page is also selected.

Only display items related to currently open maps in the Context drop-down list

If selected, only the currently open maps and contexts that are relevant to the currently open maps are displayed in the **Context** map drop-down menu in the DITA Maps Manager. This is helpful if you are working with multiple DITA-OT projects and DITA maps set as *Main Files* since it helps you narrow down the relevant contexts.

Prefer using the navigation title for rendering topic references

If selected and there is a `@navtitle` attribute set on a `<topicref>`, then the `@navtitle` is used to render the title of the topic in the **DITA Maps Manager** *(on page 3073)*.

Allow referenced submaps to be edited

If selected, all DITA maps referenced directly or indirectly in a DITA map that is open in the **DITA Maps Manager** view will be fully editable. You will be able to add new topic references, modify properties, and move topic references from one submap to another. Saving the main DITA map will also save the contents of the modified submaps.

> **Attention:**
> The documents must be reopened to apply a change to this option.

Local files only

If selected, only submaps that are located on local disk drives will be editable. As for maps located in remote locations (e.g. content management systems), the save operation might not work on all submaps. This checkbox is selected by default.

Inserting Topic References section

Always set values for the following attributes

Allows you to specify that when inserting a topic reference (using the **Insert Reference** dialog box *(on page 3099)* and **Edit Properties** dialog box *(on page 3109)*), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If selected, the `@format` attribute will always be automatically populated with a detected value.
- **Scope** - If selected, the `@scope` attribute will always be automatically populated with a detected value.
- **Type** - If selected, the `@type` attribute will always be automatically populated with a detected value.
- **Navigation title** - If selected, the `@navtitle` attribute will always be automatically populated with a detected value.

Use the file name as the value of the "keys" attribute

If selected, when inserting a topic reference into a map, the file name will be used as the value of the `@keys` attribute for the new `<topicref>`. The key is not defined on the `<topicref>` for references to DITA maps. This option has a slightly different effect depending on the method used for inserting the topic reference:

- **Drag/Drop or Copy/Paste in the DITA Maps Manager** - If you drag or copy a resource from another view (or outside Oxygen XML Editor) and drop or paste it into the **DITA Maps Manager** and a key is already defined for that resource, a `@keyref` attribute will be inserted instead. This even works for two consecutive drag/drop or copy/paste operations without saving the file and it works for multiple selections of topic references.
- **Drag/Drop or Copy/Paste in a Map opened in Author Mode** - If you drag or copy a resource from another view (or outside Oxygen XML Editor) and drop or paste it into a map that is open in **Author** mode and a key is already defined for that resource, a `@keyref` attribute will be inserted instead.

  Restriction:
  In this particular scenario, if you perform two identical, consecutive drag/drop or copy/paste operations without saving the file between operations, the value of the `@keys` attribute will be the same for both inserted topic references. The workaround for this limitation is to simply save the map after each drag/drop or copy/paste operation.

- **Using the Fast Create Topics or Duplicate Actions** - If you use the **Fast Create Topics** feature *(on page 3141)* or **Duplicate** action *(on page 3138)* to insert topic references, the newly created `<topicref>` elements will contain the `@keys` attribute with its value set depending on the file name.
- **Using the Insert Topic Reference Dialog Box from the DITA Maps Manager** - If you use an action in the **DITA Maps Manager** to insert topic references (e.g. **Append Child > Reference**), a `@keys` attribute will be set for each inserted topic reference and the value depends on the file name. If a single target was selected, you can see the value in the **Define keys** field from the **Keys** tab of the **Insert Reference** dialog box *(on page 3099)* and you can change it, while if multiple targets were selected, the values are automatically generated based on each file name when the insertion is performed, and you cannot see or change the values in that dialog box.

Note:
This option also has an effect on image references. When inserting a reference to an image in a DITA map and this option is selected, a `<keydef>` element is created if it is allowed by the schema. If it is not allowed (or this option is deselected), a specific topic reference element is created with the value of the `@processing-role` attribute set to **resource-only**.

Prefer adding key references to already referenced resources

If selected, when a topic reference is inserted into a map and a key is already defined for that resource, a `@keyref` attribute is inserted for the new `<topicref>`. If not selected, an `@href` attribute is inserted instead.

Dynamic conversion of specific non-DITA resources

If selected (default), non-DITA documents are dynamically converted to DITA when they are chosen in the **Insert Reference** dialog box *(on page 3099)* and the IDs from the resulting DITA content are presented in the dialog box. If not selected, non-DITA documents (Word, Excel, Markdown, OpenAPI, and HTML) are not dynamically converted when they are chosen in the dialog box.

Review section

When the last/first item is reached while navigating review items

This option allows you to specify what should happen when you are navigating review items in the **Review** view *(on page 675)* and you reach the last or first review item. You can choose one of the following options:

- **Open the next/previous document (in the current DITA map hierarchy) that contains review items** - If you reach the last/first review item in the document, clicking the **Next** or **Previous** navigation buttons will open the next/previous document (from the current DITA map hierarchy) that contains review items.
- **Do nothing** - If you reach the last/first review item in the document, clicking the **Next** or **Previous** navigation buttons will do nothing.
- **Always ask** - If you reach the last/first review item in the document, clicking the **Next** or **Previous** navigation buttons will open a dialog box asking if you want to open the next/previous document (from the current DITA map hierarchy) that contains review items.

DITA New Topics Preferences

To access the DITA New Topics preferences page, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **DITA > New Topics**. This preferences page includes the following options:

New Topics section

Use the title to generate the file name

This option (and its sub-options) pertain to the rules that will be used to generate file names in the *New DITA File dialog box (on page 3138)*. Select this option to use the text entered in the **Title** field to automatically generate a file name (the generated name can be seen in the **Save as** field). By default, the generated name will replace spaces with underscores (_), all illegal

characters will be removed, and all upper case characters changed to lower case, but you can use the sub-options to change this.

Replace non-alphanumeric characters with

If selected, the file name generation mechanism will replace all non-alphanumeric characters in the title with the character entered in this option.

Lower case only

If selected, the file name generation mechanism will only use lower case letters.

Use camel case

If selected, the file name generation mechanism will convert the title to a file name using the *camel case* convention where the first word starts with a lower case letter and all subsequent words begin with upper case (for example, `myFileName`).

Upper case first letter

Select this option if you want the file name generation mechanism to convert the title to a file name using the *camel case* convention but with an upper case letter for the first word (for example, `MyFileName`).

Use the file name as the value of the root ID attribute

If selected, when creating a new topic, the file name (as seen in the **Save as** field but without the file extension) will be used as the value of the root `@id` attribute for the new topic.

Inserting Links section

Always set values for the following attributes

Allows you to specify that when a link reference is inserted (using actions in the **Link** drop-down menu), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If selected, the `@format` attribute will always be automatically populated with a detected value.
- **Scope** - If selected, the `@scope` attribute will always be automatically populated with a detected value.
- **Type** - If selected, the `@type` attribute will always be automatically populated with a detected value.

Use '.' instead of the ID of the parent topic (DITA 1.3)

When addressing a non-topic element within the topic that contains the URI reference, the URI reference can use an abbreviated fragment-identifier syntax that replaces the topic ID with

`"."` (`#./elementId`). For more information, see https://www.oxygenxml.com/dita/1.3/specs/index.html#archSpec/base/uri-based-addressing.html.

DITA Publishing Preferences

To access the DITA Publishing preferences page, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **DITA > Publishing**. You can also open this page by clicking the **Configure Publishing Templates Gallery** link in the **Templates** tab of the transformation scenario dialog box for **WebHelp Responsive** transformations.

You can use this preferences page to specify additional directories where custom publishing templates are stored. The templates stored in these directories will appear in the preview pane in the **Templates** tab of the transformation scenario dialog box, along with all the built-in templates.

DITA Logging Preferences

To access the DITA Logging preferences page, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **DITA > Logging**. This preferences page includes the following sections and options:

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

Show the following types of messages in a new tab

This section allows you to specify which types of messages will be displayed in separate tabs in the message panel at the bottom of the editor if a DITA transformation results in errors or warnings. You can choose whether or not to display the following types of messages:

- DITA-OT errors
- DITA-OT warnings
- DITA-OT info
- FOP errors
- FOP warnings
- FOP info
- XSLT problems

Markdown Preferences

The **Markdown** preferences page makes it possible to validate Markdown documents with Schematron. To access the page, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Markdown**. This preferences page includes the following options:

Validate converted HTML content

If selected, converted HTML content will be validated using the Schematron file specified in this option.

Validate converted DITA content

If selected, converted DITA content will be validated using the Schematron file specified in this option.

Note:
It is also possible to create a Schematron association for Markdown documents by adding a catalog mapping *(on page 838)* for one of the following URIs:

- **http://www.oxygenxml.com/schematron/validation/markdown-as-html**
- **http://www.oxygenxml.com/schematron/validation/markdown-as-dita**

The catalog mapping is a fallback in case the validation is disabled in this preferences page or the path to the Schematron is empty. The associations configured in this preferences page take precedence.

Data Sources Preferences

To configure the **Data Sources** preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Data Sources**. This preferences page allows you to configure data sources and connections to relational and native XML databases. For a list of drivers that are available for the major database servers, see Download Links for Database Drivers *(on page 290)*.

Connection Wizards Section

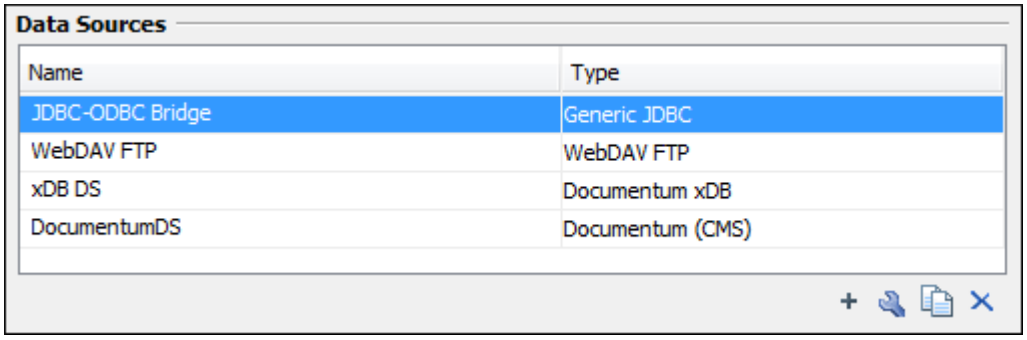
Create eXist-db XML connection

Click this link to open the dedicated **Create eXist-db XML connection** dialog box *(on page 2152)* that provides a quick way to create an eXist connection.

Data Sources Section

This section allows you to add and configure data sources.

Figure 34. Data Sources Preferences Panel

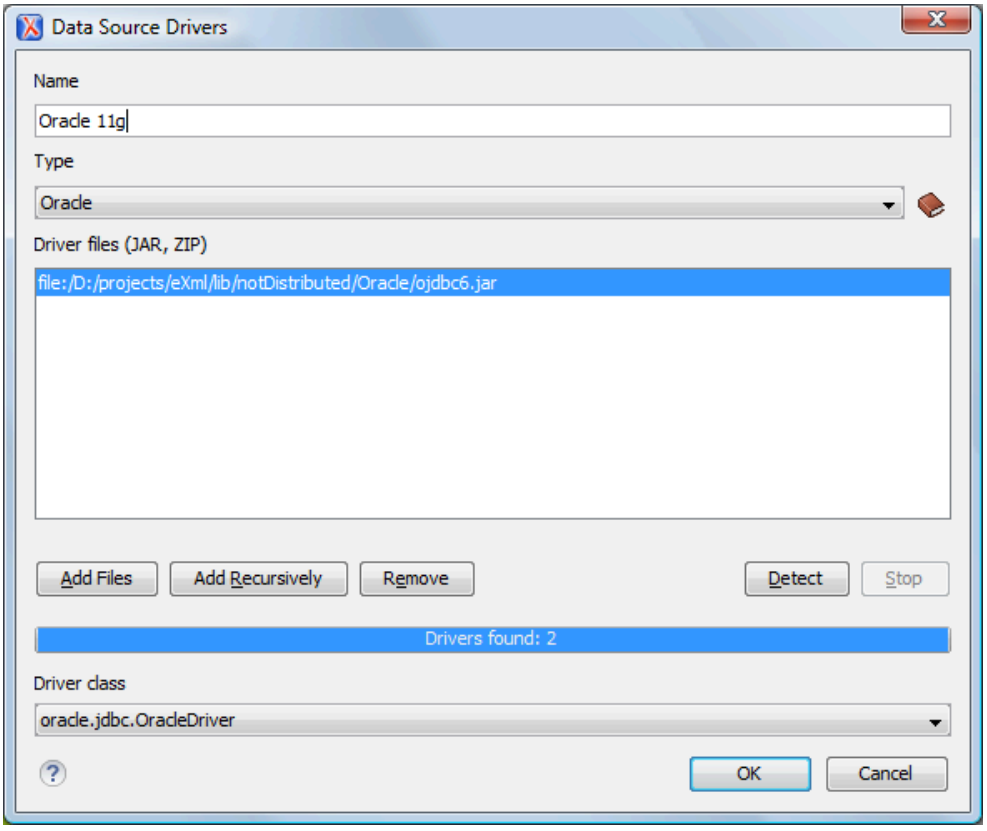


The following buttons are available at the bottom of the **Data Sources** panel:

+ New

Opens the **Data Sources Drivers** dialog box that allows you to configure a new database driver.

Figure 35. Data Sources Drivers Dialog Box



The following options are available in the **Data Source Drivers** dialog box:

- **Name** - The name of the new data source driver that will be used for creating connections to the database.
- **Type** - Selects the data source type from the supported driver types.

- **Help button** - Opens the User Manual at the list of the sections *(on page 290)* where the configuration of supported data sources is explained and the URLs for downloading the database drivers are specified.
- **Driver files (JAR, ZIP)** - Lists download links for database drivers *(on page 290)* that are necessary for accessing databases in Oxygen XML Editor.
- **Add Files** - Adds the driver class library.
- **Add Recursively** - Adds driver files recursively.
- **Remove** - Removes the selected driver class library from the list.
- **Detect** - Detects driver file candidates.
- **Stop** - Stops the detection of the driver candidates.
- **Driver class** - Specifies the driver class for the data source driver.

Edit

Opens the **Data Sources Drivers** dialog box for editing the selected driver. See above the specifications for the **Data Sources Drivers** dialog box. To edit a data source, there must be no connections using that data source driver.

Duplicate

Creates a copy of the selected data source.

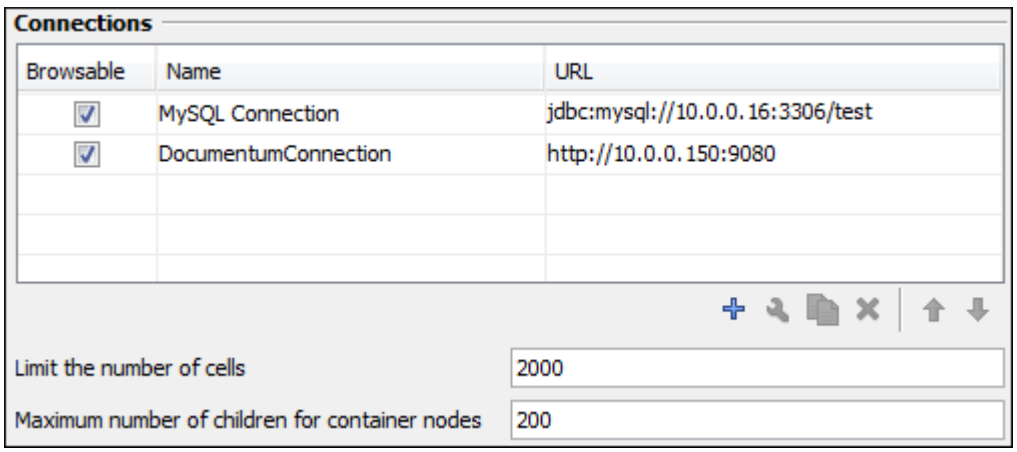
Delete

Deletes the selected driver. To delete a data source, there must be no connections using that data source driver.

Connections Section

This section allows you to add and configure data source connections.

Figure 36. Connections Preferences Panel

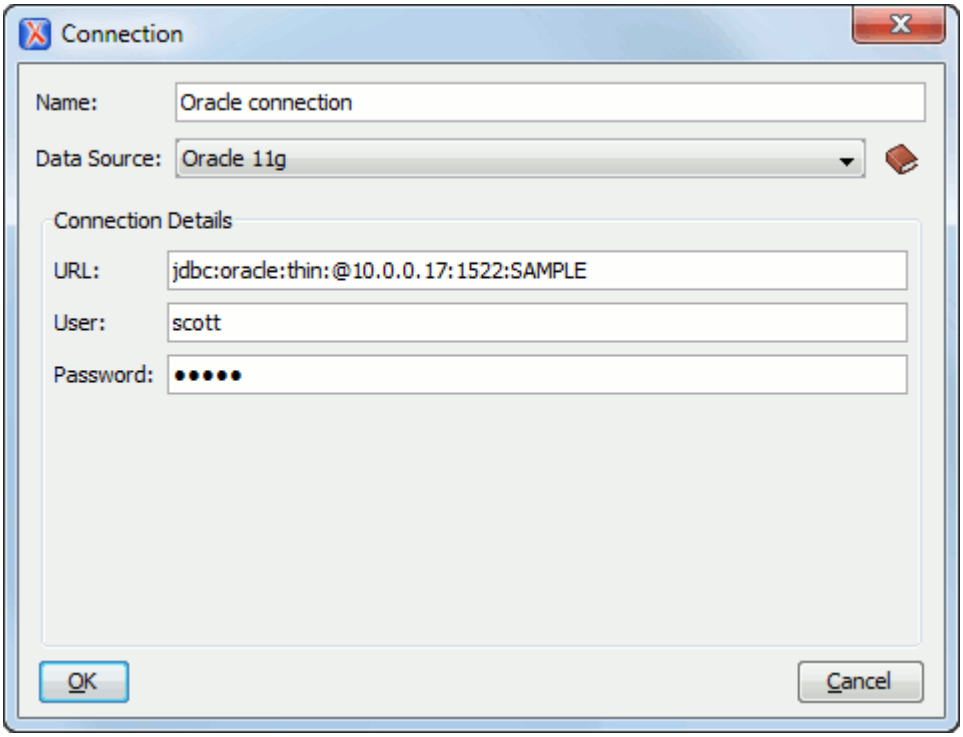


The following buttons and options are available at the bottom of the **Connections** panel:

New

Opens the **Connection** dialog box that allows you to configure a new database connection.

Figure 37. Connection Dialog Box



The following options are available in the **Connection** dialog box:

- **Name** - The name of the new connection that will be used in transformation scenarios and validation scenarios.
- **Data Source** - Allows selecting a data source defined in the **Data Source Drivers** dialog box.

Depending upon the selected data source, you can set some of the following parameters in the **Connection details** area:

- **URL** - The URL for connecting to the database server.
- **User** - The user name for connecting to the database server.
- **Password** - The password of the specified user name.
- **Host** - The host address of the server.
- **Port** - The port where the server accepts the connection.
- **XML DB URI** - The database URI.
- **Database** - The initial database name.
- **Collection** - One of the available collections for the specified data source.
- **Use a secure HTTPS connection (SSL)** - Allows you to establish a secure connection to an eXist database through the SSL protocol.

Edit

Opens the **Connection** dialog box, allowing you to edit the selected connection. See above the specifications for the **Connection** dialog box.

 **Duplicate**

Creates a copy of the selected connection.

 **Delete**

Deletes the selected connection.

 **Move Up**

Moves the selected connection up one row in the list.

 **Move Down**

Moves the selected connection down one row in the list.

Limit the number of cells

For performance issues, you can set the maximum number of cells that will be displayed in the **Table Explorer** view *(on page 2135)* for a database table. Leave this field empty if you want the entire content of the table to be displayed. By default, this field is set to 2000. If a table that has more cells than the value set here is displayed in the **Table Explorer** view *(on page 2135)*, a warning dialog box will inform you that the table is only partially shown.

Maximum number of children for container nodes

In Oracle XML, a container can hold millions of resources. If the node corresponding to such a container in the **Data Source Explorer** view *(on page 2133)* would display all the contained resources at the same time, the performance of the view would be very slow. To prevent this, only a limited number of the contained resources is displayed as child nodes of the container node. You can navigate to other contained resources from the same container by using the *Up* and *Down* buttons in the **Data Source Explorer** view *(on page 2133)*. This limited number is set in the field. The default value is 200 nodes.

Table Filters Preferences

The **Table Filters** preferences page allows you to choose the types of tables to be shown in the **Data Source Explorer** view *(on page 2133)*. To open this preferences page, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Data Sources > Table Filters**.

You can choose to display the following types of tables:

- **Alias**
- **Global Temporary**
- **Local Temporary**
- **Synonym**
- **System Table**
- **Table**
- **View**

Download Links for Database Drivers

For a list of major relational databases and the drivers that are available for them, see https://www.oxygenxml.com/database_drivers.html.

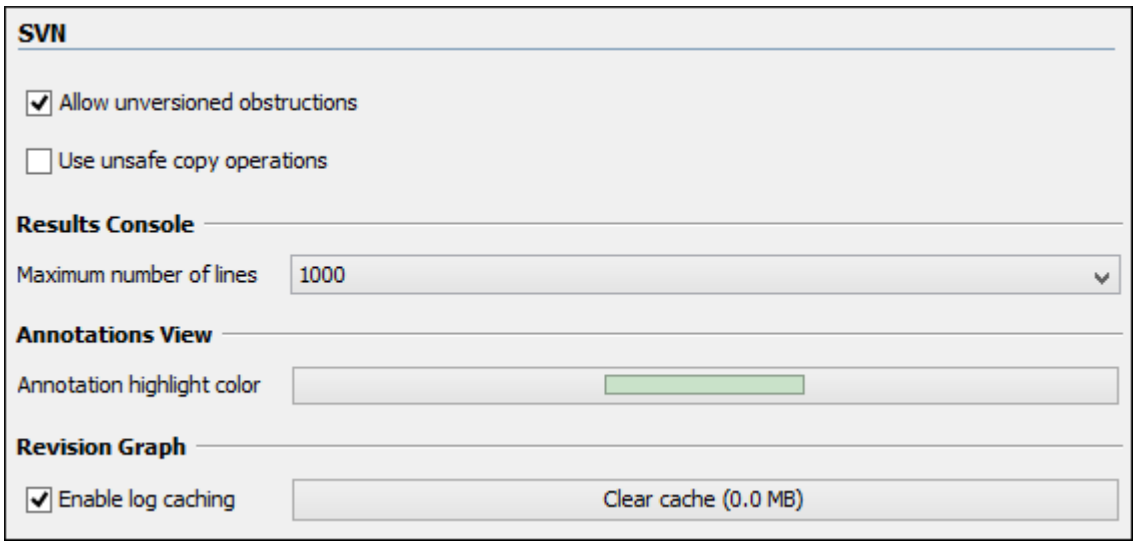
In addition, the following is a list of other popular databases along with instructions for getting the drivers that are necessary to access the databases in Oxygen XML Editor:

- **IBM DB2 Pure XML database** (Deprecated) - Go to the IBM website and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file. Unzip the zip file and use the `db2jcc.jar` and `db2jcc_license_cu.jar` files in Oxygen XML Editor for configuring a DB2 data source *(on page 2176)*.
- **eXist database** - Copy the *jar* files from the eXist database install directory to the Oxygen XML Editor install directory as described in the procedure for configuring an eXist data source *(on page 2153)*.
- **MarkLogic database** (Deprecated) - Download the MarkLogic driver from MarkLogic Community site.
- **Oracle 11g database** (Deprecated) - Go to http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html and download the Oracle 11g JDBC driver called `ojdbc6.jar`.
- **PostgreSQL database** (Deprecated) - Go to https://jdbc.postgresql.org/download/ and download the PostgreSQL JDBC driver specific for your server version.
- **Microsoft SQL Server 2019 database** (Deprecated) - Download the appropriate MS SQL JDBC driver from the Microsoft website.

SVN Preferences

To configure the options for the SVN client tool, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **SVN**. Some other preferences for the embedded SVN client tool can be set in the global files called `config` and `servers`. These files contain parameters that act as defaults applied to all the SVN client tools that are used by the same user on their computer login account. To open these files for editing, launch the embedded SVN client tool (**Tools >**  **SVN Client**) and select **Global Runtime Configuration > Edit 'config' file** or **Global Runtime Configuration > Edit 'servers' file** from the SVN client **Options** menu.

Figure 38. SVN Preferences Panel



The following SVN options can be configured in this preferences page:

Enable symbolic link support (*available only on macOS and Linux*)

Apache Subversion™ can put a symbolic link under version control, via the usual SVN *add* command. The Subversion repository has no internal concept of a symbolic link. It stores a versioned symbolic link as an ordinary file with a `svn:special` property attached. On Unix/Linux, the SVN client sees the property and translates the file into a symbolic link in the working copy. If the symbolic link support is disabled, the versioned symbolic links appear as a text file instead of symbolic link.

Note:
Windows file systems have no symbolic links, so a Windows client will not do any such translation and the object appears as a normal file.

Important:
It is recommended to disable symbolic links support if you do not have versioned symbolic links in your repository, since the SVN operations will work faster. However, you should not disable this option when you do have versioned symbolic links in repository. In that case a workaround would be to reference the working copy by its real path, instead of a path that includes a symbolic link.

Allow unversioned obstructions

Controls how to handle a situation where working copy resources are ignored / unversioned when performing an update operation and incoming files (from the repository) with the same name and location intersect with those being ignored / unversioned. If the option is selected, the incoming items will become BASE revisions of the ones already present in the working copy, and those present will be made versioned resources and will be marked as modified (exactly as if the user first made the update operation and then modified the files). If the option is not selected,

the update operation will fail when encountering files in this situation, possibly leaving other files not updated. By default, this option is selected.

Use unsafe copy operations

Sometimes when the working copy is accessed through Samba and the SVN client cannot make a safe copy of the committed file due to a delay in getting a write permission, the result is that the committed file will be saved with zero length (the content is removed) and an error will be reported. In this case, this option should be selected so that the SVN client does not try to make the safe copy.

Results Console

Specifies the maximum number of lines displayed in the **Console** view. The default value is 1000.

Annotations View

Sets the color used in the editor panel for highlighting all the changes contributed to a resource by the revision selected in the **Annotations** view.

Revision Graph

Enables caching for the action of computing a revision graph. When a new revision graph is requested, one of the caches from the previous actions may be used that will avoid running the whole query again on the SVN server. If a cache is used, it will finish the action much faster.

Working Copy Preferences

To configure the **Working Copy** preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **SVN > Working Copy**. The options in this preferences page are specific to SVN working copies and they include the following:

Working copies location

Allows you to define a location where you keep your working copies. This location is automatically suggested when you checkout a new working copy.

Working copy administrative directory

Allows you to customize the directory name where the SVN entries are kept for each directory in the working copy.

When loading an old format working copy

You can instruct the SVN client to do one of the following:

- **Always ask** - You are notified when such a working copy is used and you are allowed to choose what action to be taken (whether or not to upgrade the format of the current working copy).
- **Never upgrade** - Older format working copies are left untouched. No attempt to upgrade the format is made.

> **Note:**
> SVN 1.6 and older working copies still need to be upgraded before loading them.

Enable working copy caching

If selected, the content of the working copies is cached for refresh operations.

Automatically refresh the working copy

If selected, the working copy is refreshed from cache. Only the new changes (modifications with a date/time that follows the last refresh operation) are refreshed from disk. This option is not selected by default.

Allow moving/renaming mixed revision directories

If selected, Oxygen XML Editor will allow you to move or rename a directory even if its child items have a different revision. Otherwise, an error message is displayed when there are multiple revisions to avoid unnecessary conflicts. It is recommended to leave this option deselected and to **Update** the subtree to a single revision before moving or renaming it.

When synchronizing with repository

The action that will be executed automatically after the **Synchronize** action. The possible actions are:

- **Always switch to 'Modified' mode** - The **Synchronize** action is followed automatically by a switch to **Modified** mode of **Working Copy** view, if **All Files** mode is currently selected.
- **Never switch to 'Modified' mode** - Keeps the currently selected view mode unchanged.
- **Always ask** - The user is always asked if they want to switch to **Modified** mode.

Application global ignores

Allows you to set file patterns that may include the `*` and `?` wildcards for unversioned files and folders that must be ignored when displaying the working copy resources in the **Working Copy** view. These patterns are case-sensitive. For example,`*.txt` matches `file.txt`, but does not match `file.TXT`.

Diff Preferences

To configure the SVN Diff options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Diff**.

The following option is available:

Compare With External Application

Specifies an external application to be launched for compare operations in the following cases:

- When two history revisions are compared.
- When the working copy file is compared with a history revision.
- When a conflict is edited.

The parameters **${firstFile}** and **${secondFile}** specify the positions of the two compared files in the command line for the external diff application. The parameter **${ancestorFile}** specifies the common ancestor (that is, the BASE revision of a file) in a three-way comparison. The working copy version of a file is compared with the repository version, with the BASE revision (the latest revision read from the repository by an Update or Synchronize operation) being the common ancestor of these two compared versions.

Important:
If the path to the external compare application includes spaces (or any of the subsequent options or arguments), then each of these paths or *tokens* must be double-quoted for the Oxygen XML Editor to correctly parse and identify them. For example, `C:\Program Files\compareDir\app name.exe` must be written as `"C:\Program Files\compareDir\app name.exe"`.

Messages Preferences

The **Messages** preferences page allows you to disable certain warning messages that may appear in the application. To configure these options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **SVN > Messages**.

This preferences page allows you to disable the following warning messages:

Show confirmation dialog when using the "Update All" action

Allows you to avoid performing accidental update operations by requesting you to confirm them before execution.

Show confirmation dialog for drag and drop actions in Working Copy

This option avoids doing a drag and drop when you just want to select multiple files in the **Working Copy** view.

Show warning dialog when editing conflicts

When the **Edit Conflicts** action is executed, a warning dialog box notifies you that the action overwrites the conflicted version of the file created by an update operation. The conflicted file is overwritten with the version of the same file that existed in the working copy before the update operation and then proceeds with the visual editing of the conflicting file.

Show warning dialog when "svn:externals" definitions are ignored

A warning dialog box is displayed when "svn:externals" definitions are ignored before performing any operation that updates resources of the working copy (such as *Update* and *Override and Update*).

Diff Preferences

The Diff Preferences Page has sub-pages for configuring File Comparisons and Directory Comparisons.

Files Comparison Preferences

To configure the **Files Comparison** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Diff > Files Comparison**.

This preferences page allows you to configure the following options:

Enable file comparison in Author mode

If selected, a visual **Author** mode is available in the file comparison tool. It displays the files in a visual mode similar to the **Author** editing mode in *Oxygen XML Editor/Author*. This visual mode is available when both compared files are detected as being XML and from a recognized document type.

Ignore Whitespaces (Not applicable for the visual Author comparison mode)

If selected, before performing the comparison, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces.

Note:
If the **Ignore Whitespaces** checkbox is selected, comparing the `a b` sequence with `a b`, Oxygen XML Editor finds no differences, because after normalization, all whitespaces from the first sequence are collapsed into a single space character. However, when comparing `a b` with `ab` (no whitespace between `a` and `b`), Oxygen XML Editor signals a difference.

Two-Way Diff section

Default algorithm

The default algorithm used for comparing two files. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in **Author** comparison mode.

- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Editor, taking the syntax (the specific types of tokens) into consideration. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Algorithm strength

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

Three-Way Diff section

Default algorithm

The default algorithm used for performing a three-way comparison. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Algorithm strength

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches

the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

Show pseudo conflicts

Specifies whether or not the file comparison displays pseudo-conflicts. A pseudo-conflict occurs when two users make the same change (for example, when they both add or remove the same line of code).

XML Diff section

Ignore (Not applicable for the visual Author comparison mode)

Allows you to specify the types of XML nodes that will be ignored in the file comparison for the **XML Fast** and **XML Accurate** algorithms. You can choose to ignore *Processing Instructions*, *Comments*, *CDATA*, *DOCTYPE*, *Text*, *Namespaces*, *Prefixes*, *Namespace declarations*, and *Attribute order*.

Ignore nodes by XPath (Not applicable for the visual Author comparison mode)

If selected, you can enter an XPath expression *(on page 2117)* to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. The XPath expression specified in this option is used as the default ignore instructions **only** when the application is started. If you enter an XPath expression in the similar option on the **Diff Files** toolbar, that expression will be used instead.

Merge adjacent differences (Not applicable for the visual Author comparison mode)

If selected, the application considers two adjacent differences as one when the differences are painted in the side-by-side editors. If not selected, every difference is represented separately.

Mark end tags as different for modified elements (Not applicable for the visual Author comparison mode)

If selected, end tags of modified elements are also presented as differences. Otherwise, only the start tags are presented as differences.

Ignore expansion state for empty elements (Not applicable for the visual Author comparison mode)

If selected, empty elements in both expansion states are considered matched (that is `<element/>` and `<element></element>` are considered equal).

Appearance Preferences

To configure the appearance options for the Files Comparison tool, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Diff > Files Comparison > Appearance**. This preferences page offers the following options:

Line wrap

Wraps the lines presented in the two diff panels at the right margin of each panel, so no horizontal scrollbar is necessary.

Incoming color

Specifies the color used on the vertical bar for incoming changes.

Outgoing color

Specifies the color used on the vertical bar for outgoing changes.

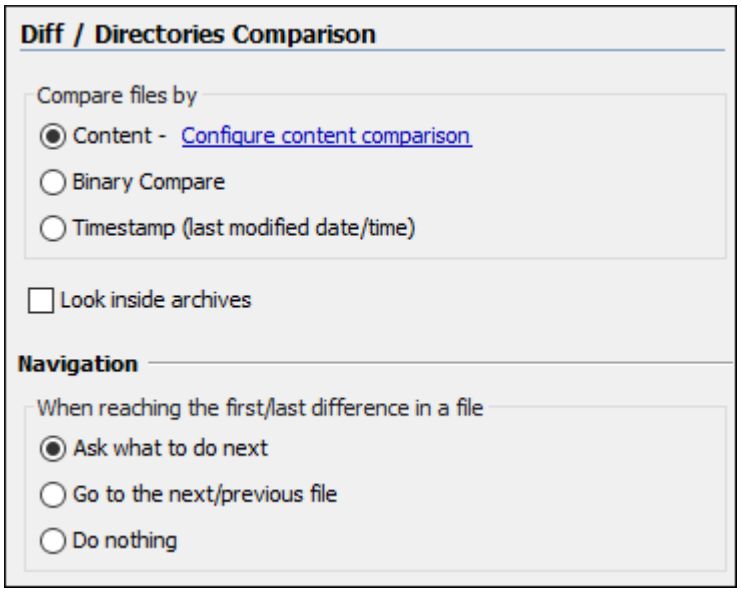
Conflict color

Specifies the color used on the vertical bar for conflicts between the compared files.

Directories Comparison Preferences

To configure the **Directories Comparison** preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Diff > Directories Comparison**.

Figure 39. Diff Preferences Page



You can specify the following options for the directories comparison tool:

Compare files by

Controls the method used for comparing two files:

- **Content** - The file content is compared using the current diff algorithm *(on page 295)*. This option is applied for a pair of files only if that file type is associated with a built-in editor type (either associated by default or associated by the user when prompted to do so on opening a file of that type for the first time).

  You can use the **Configure content comparison** link to open the **Files Comparison** preferences page *(on page 295)* where you can configure options for comparing files. However, the **Ignore nodes by XPath** option is ignored when using the **Compare Directories** tool.

- **Binary Compare** - The files are compared at byte level.
- **Timestamp (last modified date / time)** - The files are compared only by their last modified timestamp.

Look in archives

If selected, known archive types *(on page 300)* are considered directories and their content is compared just like regular files.

Navigation

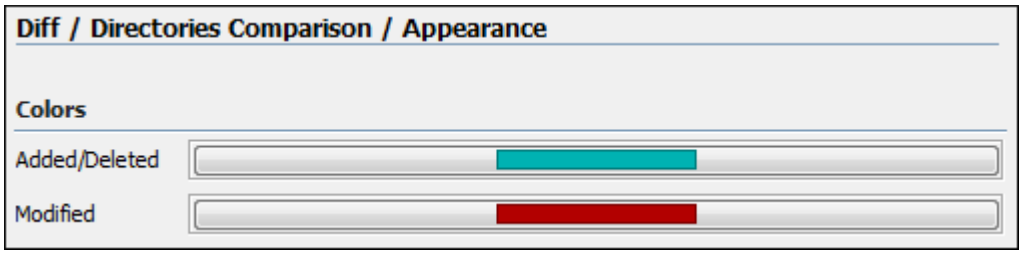
This options control the behavior of the differences traversal actions (**Go to previous modification**, **Go to next modification**) when the first or last difference in a file is reached:

- **Ask what to do next** - A dialog box is displayed asking you to confirm that you want the application to display modifications from the previous or next file.
- **Go to the next/previous file** - The application opens the next or previous file without waiting for your confirmation.
- **Do nothing** - No further action is taken.

Appearance Preferences

To configure the appearance options for the Directories Comparison tool, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Diff > Directories Comparison > Appearance**.

Figure 40. Diff Appearance Preferences Panel



- **Added/Deleted** - Color used for marking added or deleted files and folders.
- **Modified** - Color used for marking modified files.

Archive Preferences

To configure *Archive* options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Archive**.

The following options are available in the **Archive** preferences page:

Archive backup options

Controls if the application makes backup copies of the modified archives. The following options are available:

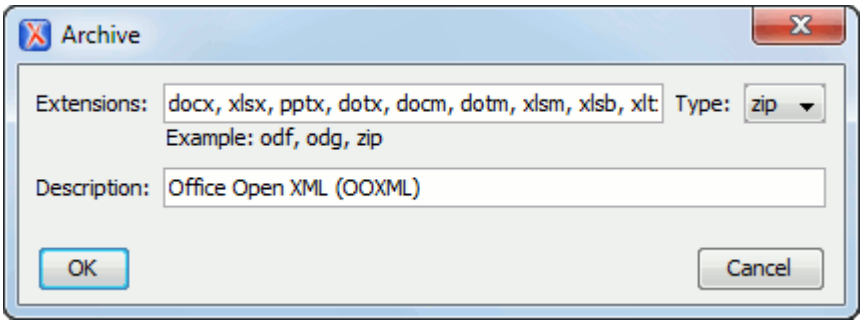
- **Always create backup copies of modified archives** - When you modify an archive, its content is backed up.
- **Never create backup copies of modified archives** - No backup copy is created.
- **Ask for each archive once per session** - Once per application session for each modified archive, user confirmation is required to create the backup. This is the default setting.

Note:
Backup files have the name `originalArchiveFileName.bak` and are located in the same folder as the original archive.

Archive types

This table contains all known archive extensions mapped to known archive formats. Each row maps a list of extensions to an archive type supported in Oxygen XML Editor. You can use the **Edit** button at the bottom of the table to edit an existing mapping or the **New** button to create a new one and associate your own list of extensions to an archive format.

Figure 41. Edit Archive Extension Mappings



Important:
You have to restart Oxygen XML Editor after removing an extension from the table for that extension to not be recognized as an archive extension.

Store Unicode file names in Zip archives

Use this option when you archive files that contain international (non-English) characters in file names or file comments. If this option is selected and an archive is modified in any way, UTF-8 characters are used in the names of all files in the archive.

Plugins Preferences

You can add *plugins (on page 3422)* that extend the functionality of Oxygen XML Editor. The *plugins* are shipped as separate packages. To check for new *plugins*, go to http://www.oxygenxml.com/oxygen_sdk.html.

A *plugin* consists of a separate sub-folder in the `Plugins` folder of the Oxygen XML Editor installation folder (for example, *`[OXYGEN_INSTALL_DIR]`*`/plugins/myPlugin`). This sub-folder must contain a valid `plugin.xml` file in accordance with the `plugin.dtd` file located in the `Plugins` folder.

Oxygen XML Editor automatically detects and loads *plugins* installed correctly in the `Plugins` folder and displays them in the **Plugins** preferences page. To configure *plugins*, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Plugins**.

You can use the checkboxes in front of each *plugin* to enable or disable them. To display the properties of a *plugin* in the second section of the **Plugins** preferences page, click the name of the *plugin*.

Also, you can install a *plugin* as an add-on. For further details about this, go to Deploying Add-ons *(on page 2565)*

External Tools Preferences

A command-line tool can be started in the Oxygen XML Editor user interface as if from the command line of the operating system shell. The **External Tools** preferences page allows you to add and configure these external tools that could be used while working with Oxygen XML Editor. To access this preferences page, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **External Tools** (or select **Configure** from the **Tools > External Tools** menu).

This preferences page presents a list of the external tools that have been configured. You can use the buttons at the bottom of the page to configure the items in the list. Once a tool has been configured, you can open it by selecting it from the **Tools > External Tools** menu or from the  **External Tools** drop-down menu on the toolbar (the **Tools** toolbar needs to be selected in the **Configure Toolbars** dialog box *(on page 374)*).

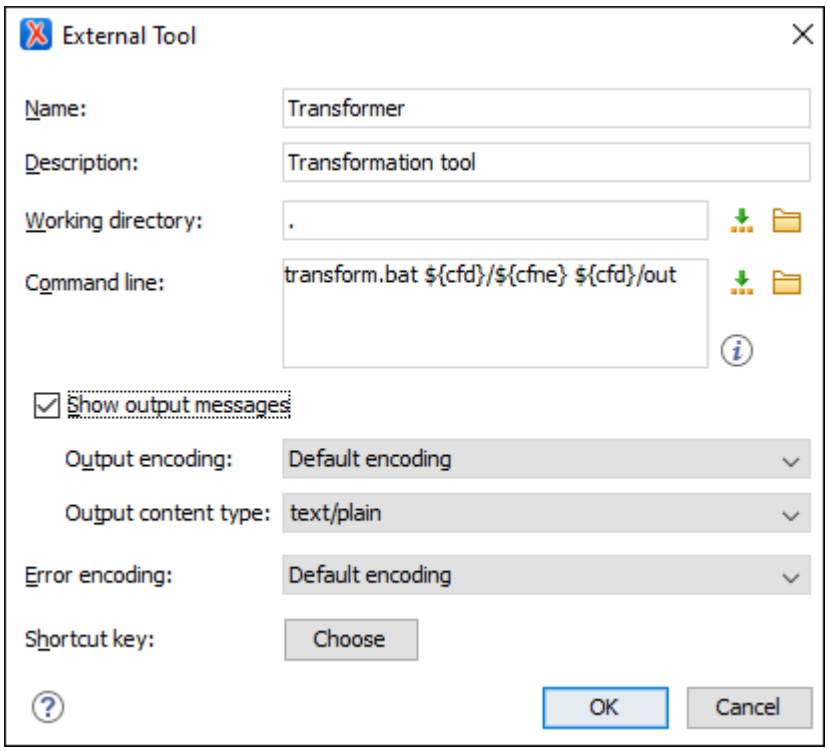
How to Configure an External Tool

To configure an external tool in the **External Tools** preferences page, use any of the following buttons at the bottom of the page:

- **New** - Adds a new external tool to the list.
- **Edit** - Allows you to configure an existing external tool, selected from the list.
- **Duplicate** - Duplicates an existing external tool, selected from the list, to use as a template for configuring a similar tool.

Any of those three buttons opens the **External Tools** configuration dialog box.

Figure 42. External Tools Configuration Dialog Box



This configuration dialog box includes the following options:

Name

The name of tool that will be displayed in the **Tools > External Tools** menu and in the **External Tools** drop-down menu on toolbar.

Description

A description of the tool displayed as a tooltip where the tool name is used.

Working directory

The directory that the external tool will use to store intermediate and final results. You can specify the path by using the text field, the **Insert Editor Variables** *(on page 332)* button, or the **Browse** button. You can use one of the following editor variables: **${cfd}** *(on page 338)*, **${pd}** *(on page 340)*, **${oxygenInstallDir}** *(on page 340)*, **${homeDir}** *(on page 340)*, **${system(var.name)}** *(on page 341)*, **${date(pattern)}** *(on page 339)*, **${xpath_eval(expression)}** *(on page 341)*.

Command line

The command line that will start the external tool. You can specify the path by using the text field, the **Insert Editor Variables** *(on page 332)* button, or the **Browse** button. You can use one of the following editor variables: **${homeDir}** *(on page 340)*, **${home}** *(on page 340)*, **${cfn}** *(on page 338)*, **${cfne}** *(on page 338)*, **${cf}** *(on page 338)*, **${currentFileURL}** *(on page 339)*, **${cfd}** *(on page 338)*, **${cfdu}** *(on page 338)*, **${tsf}** *(on page 341)*, **${pd}** *(on page 340)*, **${pdu}** *(on page 340)*, **${oxygenInstallDir}** *(on page 340)*, **${oxygenHome}** *(on page 340)*, **${frameworksDir}** *(on page 340)*, **${frameworks}** *(on page 340)*, **${ps}** *(on*

page 341), **${timeStamp}** *(on page 341)*, **${uuid}** *(on page 341)*, **${id}** *(on page 340)*, **${afn}** *(on page 333)*, **${afne}** *(on page 333)*, **${af}** *(on page 333)*, **${afu}** *(on page 333)*, **${afd}** *(on page 333)*, **${afdu}** *(on page 333)*, **${ask('message', type, 'default_value')}** *(on page 334)*, **${dbgXML}** *(on page 339)*, **${dbgXSL}** *(on page 339)*, **${env(VAR_NAME)}** *(on page 339)*, **${system(var.name)}** *(on page 341)*, **${date(pattern)}** *(on page 339)*, and **${xpath_eval(expression)}** *(on page 341)*.

Show output messages

When this option is selected, all the messages emitted by the external tool are displayed in the **Results** view *(on page 558)* view. When this option is not selected, only the error messages are displayed. You can also choose the output encoding and content type:

- **Output encoding** - The encoding of the output stream of the external tool that will be used byOxygen XML Editor to read the output of the tool.
- **Output content type** - A list of predefined content type formats that instructOxygen XML Editor how to display the generated output. For example, setting the **Output content type** to `text/xml` enables the syntax coloring of XML output.

Error Encoding

The encoding of the error stream of the external tool that will be used by Oxygen XML Editor to read the error stream.

Shortcut key

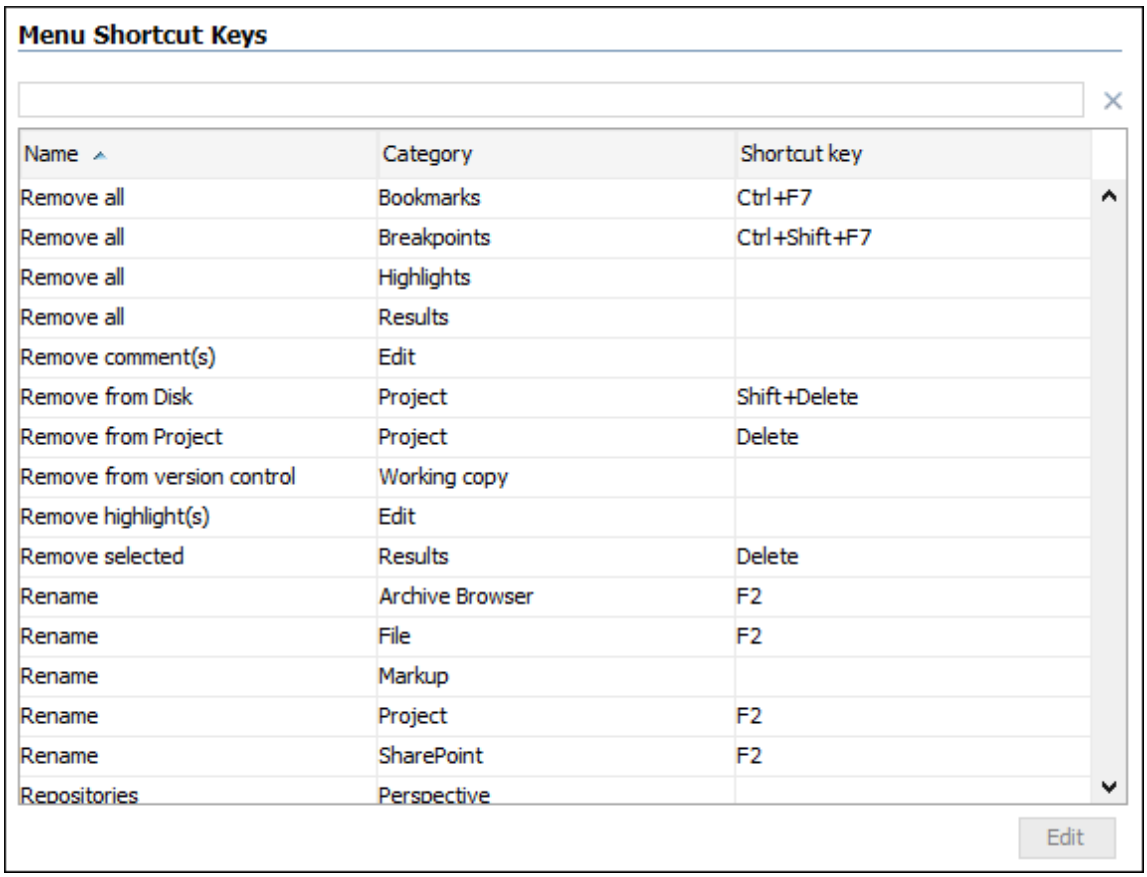
You can choose a keyboard shortcut that can be used to launch the external tool.

Menu Shortcut Keys Preferences

You can use the **Menu Shortcut Keys** preferences page to configure shortcut keys for the actions available in Oxygen XML Editor. The shortcuts assigned to actions are displayed in a table in this preference page. To access the full list of shortcut keys, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Menu Shortcut Keys** (or simply go to **Options > Menu Shortcut Keys**).

For a list of the most commonly used shortcuts, see Frequently Used Shortcut Keys *(on page 55)*.

Figure 43. Menu Shortcut Keys Preferences Page



The **Menu Shortcut Keys** preferences page also contains the shortcuts that you define at *document type* level *(on page 157)*.

Note:
A shortcut defined at *document type* level overwrites a default shortcut.

Furthermore, the shortcuts table also contains entries for actions that show side-views contributed by plug-ins.

To find a specific action, you can use the filter text field to search through any of the columns in the table. You can also press shortcut key combinations on your keyboard to filter the list and click on a column header to sort that column.

The table includes the following columns or options:

- **Description** - A short description of the action.
- **Category** - A classification of the actions in categories for easier management and more flexibility in assigning multiple keys for the same action.

- **Shortcut key** - The combination of keyboard keys that can be used to launch the action. To add or change a shortcut key, you can either double-click a row or select the row and click the **Edit** button.
- **'Home' and 'End' keys are applied at line level** (available on macOS only) - Controls the way the HOME and END keys are interpreted. If selected, the default behavior of these keys is overridden and the cursor only moves on the current line.

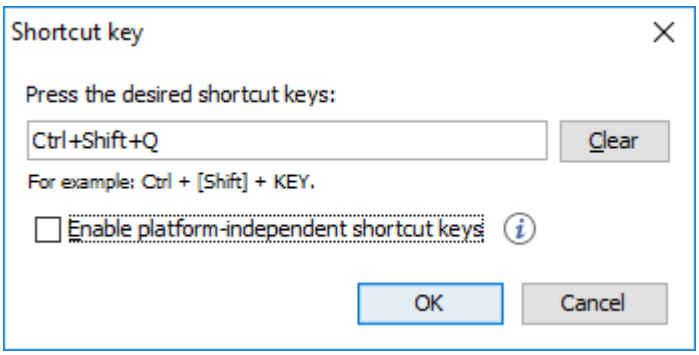
How to Assign a Shortcut Key or Edit an Existing Shortcut

To assign a shortcut key to an action or edit an existing shortcut configuration, follow these steps:

1. Select the action in the table.
2. Click the **Edit** button.

   Step Result: The **Shortcut key** configuration dialog box is displayed.

   Figure 44. Shortcut Key Configuration Dialog Box

3. Press the desired shortcut keys on your keyboard.
4. If you need the shortcut to work on multiple platforms, select the **Enable platform-independent shortcut keys** option. In this case, the following modifiers are used:
   - **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
   - **M2** represents the **Shift** key.
   - **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
   - **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.
5. Click **OK** to save your configuration.

Troubleshooting:
If you encounter problems with keyboard shortcuts not working as expected, see Keyboard Shortcuts Result in Unexpected Behavior *(on page 3054)* or Keyboard Shortcuts Do Not Work At All *(on page 3053)*.

Related information

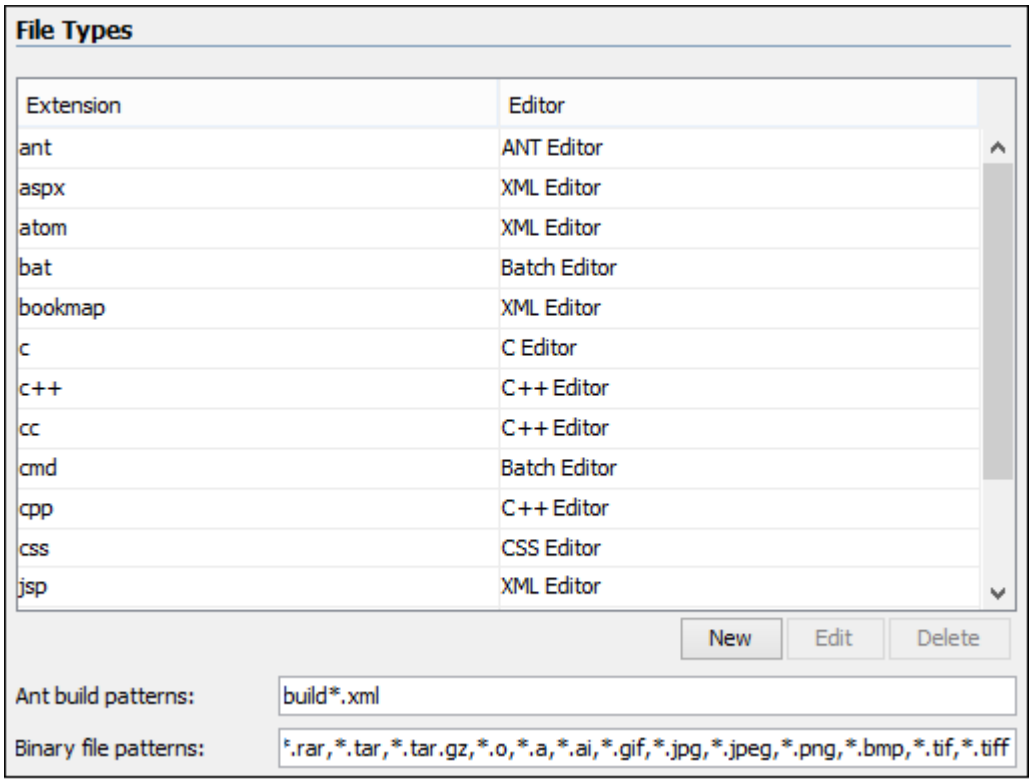
Frequently Used Shortcut Keys *(on page 55)*

File Types Preferences

Oxygen XML Editor offers built-in editing support for a wide variety of file types, but you can also add new file extensions and associate them with whatever editor type fits your needs. The associations set here between a file extension and the type of editor will determine which editor will be opened for editing purposes when that type of file is created or opened.

To configure the **File Types** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **File Types**.

Figure 45. File Types Preferences Page



The table contains the following columns:

- **Extension** - The extensions of the files that will be associated with an editor type.
- **Editor** - The type of editor which the extensions will be associated with. Some editors provide easy access to frequent operations via toolbars (XML editor, XSL editor, DTD editor) while others provide just a syntax highlight scheme (Java editor, SQL editor, Shell editor).

  If the editor set here is not one of the XML editors (XML editor, XSL editor, XSD editor, RNG editor, WSDL editor) then the encoding set in the **Encoding for non-XML files** option *(on page 175)* is used for opening and saving a file of this type.

The files that match the **Ant build patterns** will be associated with the Ant editor.

The files that match the **Binary file patterns** patterns are handled as binary and opened in the associated system application. Also, they are excluded from the following actions available in the **Project** view *(on page 413)*: **File/Replace in Files**, **Check Spelling in Files**, **Validate**.

Note:
If you associate an empty extension to a content type, all files without extensions will be opened with that specific content type.

Open/Find Resource Preferences Page

You can configure various options that pertain to the **Open/Find Resource** dialog box *(on page 436)* and **Open/Find Resource** view *(on page 433)*. To access these options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Open/Find Resource**.

The following options are available in this **Open/Find Resource** preferences page:

Refresh index when opening a map in DITA Maps Manager

If selected, DITA maps that are opened in the DITA Maps Manager will automatically be re-indexed.

Only index files referenced in the context DITA map as "resource-only"

If selected, only files referenced as "resource-only" in the context DITA map or in its referenced sub maps are indexed. By default, the setting is not selected.

Tip:
It makes sense to enable this setting if the current opened project contains lots of resources to speed up computation of the reusable components displayed in the **DITA Reusable Components** view's **Components** tab.

Limit search results to

Specifies the maximum number of results that are displayed in the **Open/Find Resource** dialog box/view *(on page 436)*.

Enable searching in content

This option is selected by default and it allows you to use the **Open/Find Resource** dialog box/view *(on page 436)* to search in content or reviews, as well as in file paths. If this option is not selected, you can only use the **Open/Find Resource** feature to search in file paths.

Content search scope section

Ignore content of these files

Allows you to select specific directories, files, or file types that are ignored when you perform a search. For example, `*.txt` ignores all the `.txt` files, `*/topics/`

`*` ignores all the files from the `topics` directory, regardless of their depth, and `file:/C:/tmp/*` ignores everything from the `tmp` directory.

Include the contents of these binary files

Results from a search in the **Open/Find Resource** dialog box/view *(on page 436)* will be returned as a PDF if the PDF contains the searched text. If you want to disable this feature, delete the contents of the text field.

Index the content of remote resources

Controls the indexing of resources that are not local. For example, the resources referenced in a *DITA map (on page 3419)* opened from a remote server (from a CMS or from a WebDAV location) are not indexed by default. To index the content of these resources, select this option.

Note:
Selecting this option may lead to delays when the indexing is computed.

Content search options section

Content language

Use this option to specify a language for the search engine to use for the current document. This is helpful if you have multiple languages within the content of a document. The search engine will use a set of *stop words* and analyzers tuned specifically for that specific language. By default, it is mapped to the UI language specified in the **Global** preferences page *(on page 133)*. Therefore, you need to change this option only if the language of the text you want to perform the search in differs from the UI language.

Tip:
If you select **<Generic language (no stemming)>** from the drop-down list, no word stemming is performed when creating the index. This might be useful if your content has many technical terms that should be indexed as they are.

Stop words

A list of *stop words* that will be filtered out of the search processing. The list is automatically populated based upon the specified **Content language**, but you can add or remove words from the list.

When searching in content, return

This option specifies how matches are returned when doing searches in content. You can choose between two options:

- **Exact matches** - The search results match the exact whole words that you enter in the search field of the **Open/Find Resource** dialog box/view.
- **Prefix matches** (default) - The search results match documents that contain words starting with the search terms. For instance, searching for "pref page" will also find documents containing "preference page".

Automatically join search terms using:

Allows you to select the default boolean operator that Oxygen XML Editor applies when you perform a search. For example, if the AND operator is selected and you search for "car assembly", the matches must contain both of the words. If you choose OR, the matches must contain one of the selected search terms and results that contain both words are promoted to the top of the list.

Enable XML-aware searching

When selected, you can perform XML-specific searches *(on page 439)* for XML elements and attributes.

Note:
Selecting this option may slow down the indexing of your documents and increase the index size on the disk.

Index files with size less than (KB)

Since indexing can be slowed down when the **Enable XML-aware searching** option *(on page 309)* is active, you can use this option to set a maximum file size to be indexed.

Stop Words

A list of comma-separated *stop words*, meaning that the words added in this list are filtered out prior to processing a search query.

Open/Find Resource Dialog Box *(on page 436)*

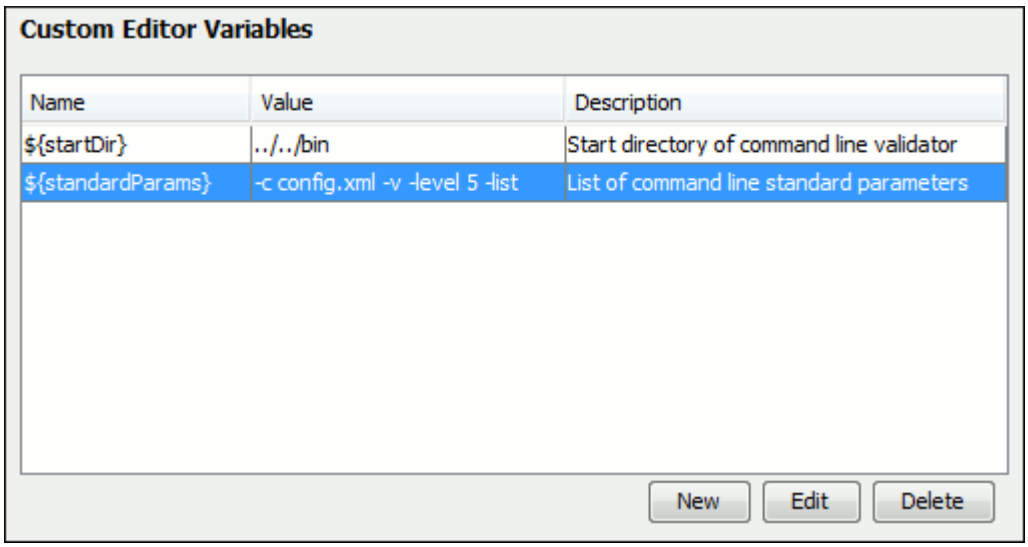
Custom Editor Variables Preferences

An editor variable *(on page 332)* is useful for making a transformation scenario, validation scenario, or other tool independent of its file path. An editor variable is specified as a parameter in a transformation scenario, validation scenario, or command line of an external tool. Such a variable is defined by a name, a string value, and a text description. A custom editor variable is defined by the user and can be used in the same expressions as the built-in editor variables *(on page 332)*.

Custom editor variables are created and configured in the **Custom Editor Variables** preferences page. To access this page, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Custom Editor Variables**.

This preferences page displays a table of all the custom editor variables that have been defined. The table includes three columns for the editor variable **Name**, its **Value**, and its **Description**. The create a new variable, click the **New** button at the bottom of the table and define your custom editor variable in the subsequent dialog box. To edit an existing custom editor variable, click the **Edit** button and configure the variable in the subsequent dialog box. You can also use the **Delete** button to remove custom editor variables that are no longer needed.

Figure 46. Custom Editor Variables Table



Network Connection Settings Preferences

This section presents the options available in the **Network Connection Settings** preferences pages.

Proxy Preferences

Some networks use proxy servers to provide internet services to LAN clients. Therefore, clients behind the proxy may only connect to the Internet via the proxy service. If you are not sure if your computer is required to use a proxy server to connect to the Internet or you do not know the proxy parameters, consult your network administrator.

To configure the **Proxy** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Network Connection Settings > Proxy**. The following options are available:

Proxy section

Specifies how HTTP(S) connections go through the proxy server. You can choose between the following three options:

- **Direct connection** - HTTP(S) connections will go directly to the target host without going through a proxy server.
- **Use system settings** (default setting) - HTTP(S) connections will go through the proxy server set in the operating system.

Attention:
The system settings for the proxy cannot be read correctly from the operating system on some Linux systems. The system settings option should work properly on Gnome-based Linux systems, but it does not work on KDE-based ones as the Java virtual machine does not offer the necessary support yet.

- **Manual proxy configuration** - HTTP(S) connections will go through the proxy server specified in the **Web Proxy (HTTP/HTTPS)** section.

Web Proxy (HTTP/HTTPS) section

Address

The address of the proxy server used for manual configurations.

Port

The port of the proxy server used for manual configurations.

No proxy for

Specifies the hosts that the connections must not go through a proxy server.
A host needs to be written as a fully qualified domain name (for example, `myhost.example.com`) or as a domain name (for example, `example.com`). Use a comma to separate multiple hosts.

User

The user name for authentication with the proxy server.

Password

The password for authentication with the proxy server.

SOCKS Proxy section

Address

The address of a SOCKS proxy that all connections will pass through. If this field is empty, the connections do not use a SOCKS proxy.

Port

The port of a SOCKS proxy that all connections will pass through.

HTTP(S)/WebDAV Preferences

To set the **HTTP(S)/WebDAV** preferences, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Network Connection Settings > HTTP(S)/WebDAV**. The following options are available:

Maximum number of simultaneous connections per host

Defines the maximum number of simultaneous connections established by the application with a distinct host. Servers might consider multiple connections opened from the same source to be a **Denial of Service** attack. You can avoid that by lowering the value of this option.

> **Note:**
> The minimum value that can be set in this option is 5.

Read Timeout (seconds)

The period (in seconds) after which the application considers that an HTTP server is unreachable if it does not receive any response from that server.

Enable HTTP 'Expect: 100-continue ' handshake (for HTTP/1.1 protocol)

Activates *Expect: 100-Continue* handshake. The purpose of the *Expect: 100-Continue* handshake is to allow a client that is sending a request message with a request body to determine if the origin server is willing to accept the request (based on the request headers) before the client sends the request body. The use of the *Expect: 100-continue* handshake can result in noticeable performance improvement when working with databases. The *Expect: 100-continue* handshake should be used with caution, as it may cause problems with HTTP servers and proxies that do not support the HTTP/1.1 protocol.

Use the 'Content-Type' header field to determine the content type

When selected, Oxygen XML Editor tries to determine a resource type using the **Content-Type** header field. This header indicates the *Internet media type* of the message content, consisting of a type and subtype. For example:

```
Content-Type: text/xml
```

When unchecked, the resource type is determined by analyzing its extension. For example, a file ending in `.xml` is considered to be an XML file.

Automatic retry on recoverable error

When selected, if an HTTP error occurs when Oxygen XML Editor communicates with a server via HTTP (for example, sending or receiving a SOAP request to or from a Web services server) and the error is recoverable, Oxygen XML Editor tries to re-send the request to the server.

Cache content for similar HTTP requests when opening and validating documents

When opening XML documents that contain lots of `xi:include` elements over HTTP (for example), depending on how content is reused, there may be lots of HTTP requests to the same target files during the validation or opening of the XML document. When this setting is selected,

HTTP calls to the same target file are cached and the opening and validation of such XML documents may take less time.

Automatically accept a security certificate, even if invalid

When selected, the HTTPS connections that Oxygen XML Editor attempts to establish with will accept all security certificates, even if they are invalid.

> **Important:**
> By accepting an invalid certificate, you accept (at your own risk) a potential security threat, since you cannot verify the integrity of the certificate's issuer.

Lock WebDAV files on open

If selected, the files opened through WebDAV are locked on the server so that they cannot be edited by other users while the lock placed by the current user still exists on the server.

(S)FTP Preferences (Deprecated)

To configure the **(S)FTP** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Network Connection Settings > (S)FTP**. You can customize the following options:

Encoding for FTP control connection

The encoding used to communicate with FTP servers: either ISO-8859-1 or UTF-8. If the server supports the UTF-8 encoding, Oxygen XML Editor will use it for communication. Otherwise, it will use ISO-8859-1. This section also includes a **Show hidden files** toggle option.

Public known hosts file

Specifies the file that contains the list of all SSH server host keys that you have determined are accurate. The default value is `${homeDir}/.ssh/known_hosts`.

Private key file

The path to the file that contains the private key used for the private key method of authentication of the secure FTP (SFTP) protocol. Only *RSA* private keys in *PEM* (Base64) and *PPK* (*PuTTY*) formats are supported. Other keys (such as *OpenSSH*) are not supported. The user / password method of authentication has precedence if it is used in the Open URL dialog box *(on page 396)*.

Passphrase

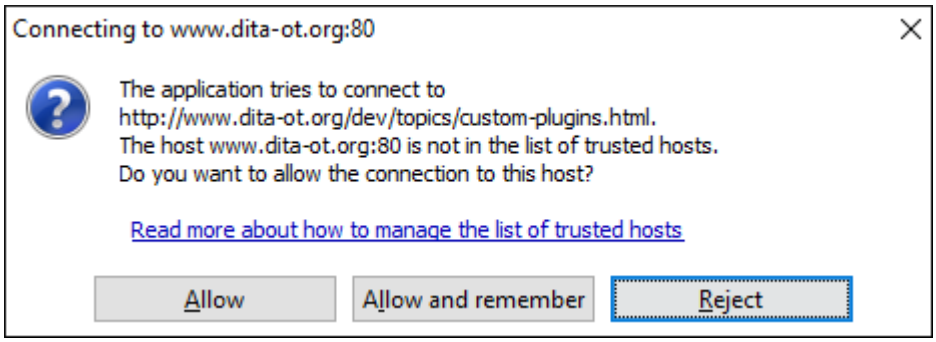
The passphrase used for the private key method of authentication of the secure FTP (SFTP) protocol. The user / password method of authentication has precedence if it is used in the Open URL dialog box *(on page 396)*.

Trusted Hosts Preferences

Oxygen XML Editor comes with a built-in firewall that controls the access to external resources. Anytime the application detects a request to connect to a remote resource, it checks to see if the URL belongs to a domain

that has been identified as trusted. If not, a confirmation dialog box will be displayed where you can choose whether to allow or reject access to the remote connection.

Figure 47. Trusted Hosts Confirmation Dialog Box



You can configure the list of trusted hosts using the **Trusted Hosts** preferences page. It contains a list of domains that have been identified as trusted. You can add or remove domains from the list and Oxygen XML Editor will allow connections to the listed hosts without requesting user confirmation.

Note:
Connections defined in the **Data Sources** preferences page *(on page 285)* or accepted by add-ons are also considered trusted.

To add or remove domains, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Network Connection Settings > Trusted Hosts**. The following options are available:

- **New** - Allows you to manually add a new entry to the list of trusted hosts.

  Tip:
  You can specify a specific port at the end of the URL (for instance, `www.example.com:8080`). Otherwise, if no port is specified, connections will be allowed on all ports for the particular host.

- **Delete** - Allows you to remove an entry from the list of trusted hosts.

SSH Preferences

To configure the **SSH** options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Connection settings > SSH**. The following options are available:

SSH

Specifies the command line for an external SSH client that will be used when connecting to a SVN+SSH repository. Absolute paths are recommended for the SSH client executable and the file paths given as arguments (if any). Depending on the SSH client used and your SSH server configuration, you may need to specify the user name and/or private key/passphrase in the command line. You can also choose whether to use the **Default SVN user** (the same user name

as the SSH client user) or **Prompt for a SVN user** for SVN repository operations whenever SVN authentication is required. For example, on Windows the following command line uses the `plink.exe` tool as the external SSH client for connecting to the SVN repository with SVN+SSH:

```
C:\plink-install-folder\plink.exe -l username -pw password -ssh -batch
host_name_or_IP_address_of_SVN_server
```

XML Structure Outline Preferences

To configure options regarding the **Outline** view *(on page 549)*, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML Structure Outline**. It contains the following options:

Preferred attribute names for display

The preferred attribute names when displaying the attributes of an element in the **Outline** view. If there is no preferred attribute name specified, the first attribute of an element is displayed.

Enable outline drag and drop

Drag and drop is disabled for the tree displayed in the **Outline** view only if there is a possibility to accidentally change the structure of the document by such operations.

Views Preferences

The **Views** preferences page allows you to configure some options regarding certain views. To edit these options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Views**.

The following options are available:

Project view section

Enable drag-and-drop in Project view

Enables drag and drop support in the **Project** view *(on page 413)*. It should be disabled only if there is a possibility of accidentally changing the structure of the project by drag and drop actions.

Information view section

Maximum number of lines

Specifies the maximum number of lines that can be written in the **Information** view *(on page 522)*.

Elements view section

Show only allowed items

If selected, when editing in **Author** mode, only the elements that are allowed at the current cursor position will be listed in the **Elements** view *(on page 643)*. If not selected, all elements allowed by the schema will be listed, even if they are already used.

Messages Preferences

The **Messages** preference page allows you to specify whether or not certain messages are displayed. To configure these options, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Messages**.

The following warning messages can be enabled or disabled:

Show Java vendor warning at startup

If this option is selected, Oxygen XML Editor displays a warning on startup if a non-recommended version of the Java virtual machine is being used.

Show confirmation dialog when moving resources

Specifies whether or not to display a confirmation dialog box when you move a resource in the **Project** view *(on page 413)*, **Data Source Explorer** view *(on page 2133)*, and **Archive Browser** *(on page 2126)*. In the confirmation dialog box, there is an option to choose to not show this dialog box in the future. To reset that behavior, simply select **Restore Defaults** at the bottom of this preferences page.

Show warning when adding resources already included in the project

Specifies whether or not to display a dialog box that warns you if you try to add files that already exist in your project.

Show warning for document size limit for bidirectional text, Asian languages, and other special characters

Specifies whether or not to display a warning message when an open file that contains bidirectional characters is too large and bidirectional support is disabled.

Show warning message when changing the text orientation in the editor

Specifies whether or not to display a warning message when you change the text orientation in the editor.

Show warning when editing long expressions in the XPath toolbar

Specifies whether or not to display an information dialog box that allows you to specify if you want to use the **XPath/XQuery Builder** *(on page 2120)* view when editing long XPath expressions.

Show MathML editor recommendation

Specifies whether or not to display an information dialog box that recommends using the **MathFlow Editor** *(on page 762)* to edit MathML equations.

Show SFTP certificate warning dialog

Specifies whether or not to display a warning dialog box each time the authenticity of the SFTP server host cannot be established.

Show Enterprise license related message when trying to connect to a Microsoft SharePoint server

Specifies whether or not to display an error message if you try to connect to a Microsoft SharePoint server without having the proper license.

Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions

Specifies whether or not to display a dialog box that allows you to choose a specific encoding whenever you use the **Encode Selection** or **Decode Selection** actions for *Base64 (on page 579)*, *Base32 (on page 580)*, or *Hex conversions (on page 581)*. In the dialog box, there is an option to choose to not show this dialog box in the future. To reset that behavior, simply select **Restore Defaults** at the bottom of this preferences page.

Show the dialog box that suggests switching to the DITA perspective

Specifies whether or not to display a dialog box that asks you if you want to switch to the **DITA** perspective when you open a DITA resource from the **DITA Maps Manager** *(on page 3073)*.

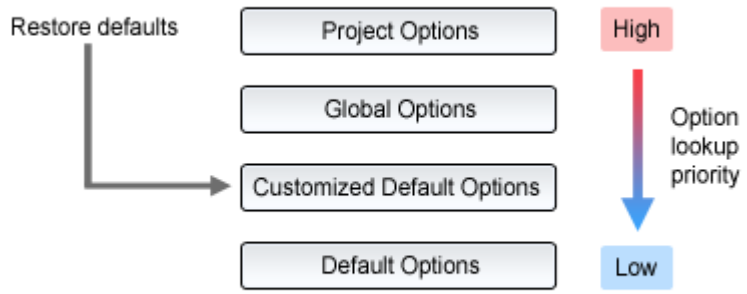
Convert DB Structure to XML Schema

When tables from a database schema are selected in the **Select database table** section of the **Convert DB Structure to XML Schema** dialog box *(on page 1037)* and another database schema is expanded, a confirmation is needed since the previous selection will be discarded. This option specifies whether or not you are always asked if you want the other database schema to always be expanded without asking you, or it is never expanded.

Configuring Options

A set of options controls the behavior of Oxygen XML Editor, allowing you to configure most of the features. To offer you the highest degree of flexibility in customizing the application to fit the needs of your organization, Oxygen XML Editor includes several distinct layers of option values.

Figure 48. Option Lookup Priority



The option layers are as follows (sorted from high priority to low):

- **Project Options** *(on page 321)*

  Allows project managers to establish a set of rules for a specific project. These rules standardize the information exchanged by the team members (for example, if the project is stored in a repository, a

common set of formatting rules avoid conflicts that may appear when documents modified by various team members are committed to the repository).

- **Global Options** *(on page 321)*

  Allows individual users to personalize Oxygen XML Editor according to their specific needs.

- **Customized Default Options** *(on page 318)*

  Designed to customize the initial option values for a group of users, this layer allows an administrator to deploy the application preconfigured with a standardized set of option values.

  Note:
  Once this layer is set, it represents the initial state of Oxygen XML Editor when an end-user selects the **Restore defaults** *(on page 132)* or **Reset Global Options** *(on page 323)* actions.

- **Default Options**

  The predefined default values, tuned so that Oxygen XML Editor behaves optimally in most working environments.

Important:
If you set a specific option in one of the layers, but it is not applied in the application, make sure that one of the higher priority layers does not overwrite it.

Customizing Default Options

Oxygen XML Editor has an extensive set of options that you can configure. When Oxygen XML Editor in installed, these options are set to default values. You can provide a different set of default values for an installation using an XML *options file*.

Creating an XML *Options File*

To create an *options file*, follow these steps:

1. It is recommended that you use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. Open Oxygen XML Editor and open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*.
3. Go through the options and set them to the desired defaults. Make sure that **Global Options** *(on page 3420)* is selected in each page.
4. Click **OK** and close the **Preferences** dialog box.
5. Go to **Options > Export Global Options** to create an XML options file.

Controlling Which Options are Stored in the Default Options File

If you want to control exactly which option pages will be stored in the default options file, you can choose to attach them to a project file (`.xpr` file extension) by following this procedure:

1. You may want to use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. In the **Project** view *(on page 413)*, create a project or open an existing one.
3. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*.
4. Configure the options in each preferences page that you want to be included in the project file and switch the storage preference to **Project Options** *(on page 3423)* in each page.

   > **Note:**
   > Some pages do not have the **Project Options** button, since the options they host might contain sensitive data (such as passwords, for example) that is unsuitable for sharing with other users.

5. Click **OK** and close the **Preferences** dialog box.

   All explicitly set values are now saved in the project file. You can then share the project file so that your team will have the same option configuration that you stored in the project file.

   > **Note:**
   > The project file extension (`.xpr`) must be preserved when the file is distributed to others.

   > **Notice:**
   > When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Configuring an Installation to Use Customized Default Options

There are several methods that you can use to configure an Oxygen XML Editor installation to use the customized default options from the created XML options file.

> **Warning:**
> The disadvantage of customizing the default options is that if the end-user manually changes an option, the default value will no longer be used. An alternative would be to use a plugin to impose a set of options *(on page 320)*.

The possible methods for using customized default options during an installation include:

- **Copy the XML Options File to the Installation Directory**

  In the *[OXYGEN_INSTALL_DIR]*, create a folder called `preferences` and copy the created XML options file into it (for example, *[OXYGEN_INSTALL_DIR]*`/preferences/default.xml`).

- **Specify a Path to the XML Options File in a Startup Parameter**

  Set the path to the XML options file as the value of the `com.oxygenxml.default.options` system property in the startup parameters *(on page 348)*. The path can be specified with any of the following:
  - A URL or file path relative to the application installation folder. For example:

    ```
    -Dcom.oxygenxml.default.options=options/default.xml
    ```

  - A system variable that specifies the file path. For example:

    ```
    com.oxygenxml.default.options=${system(CONFIG)}/default.xml
    ```

  - An environmental variable that specifies the file path. For example:

    ```
    com.oxygenxml.default.options=${env(CONFIG)}/default.xml
    ```

Impose a Set of Options Using a Plugin

The Oxygen XML SDK includes a sample Java-based **oxygen-sample-plugin-impose-options** plugin that shows how to impose a set of options for the end-users every time the API is called. It is possible to use this plugin to impose options but still allow the end-user to change options by calling the API only once, the first time the plugin starts along with Oxygen XML Editor.

A similar JavaScript-based sample **impose-options** plugin is also available here: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins. This plugin imports a fixed set of options (saved in XML format) when Oxygen XML Editor starts.

Related information

Sharing Application Settings *(on page 321)*

Storing Global and Project Level Options

When you configure the Oxygen XML Editor options, you can store them globally or bind them to a specific project by choosing the appropriate setting in the preferences pages. They can then be shared with others by exporting the global options *(on page 322)* or by sharing the stored project-level files *(on page 322)*. The same is true with transformation and validation scenarios.

For each preferences page, you can choose between **Global Options** *(on page 321)* and **Project Options** *(on page 321)* depending upon how you want to store the options in that particular preferences page.

Notice:
Some pages do not have the **Project Options** button, since the options they host might contain sensitive data (passwords, for example), unsuitable for sharing with other users.

If changes have been made to the options in a preferences page and you switch between **Project Options** and **Global Options**, a dialog box will be displayed that allows you to select one of the following:

- **Overwrite** - The existing options from the current preferences page will be overwritten.
- **Preserve** - The existing options from the current preferences page will be preserved.

Figure 49. Controlling the Storage Options for the Preferences

Global Options

By default, **Global Options** is selected in the preferences pages, meaning that the options are stored locally on your computer and are not accessible to other users (unless you export them into an XML options file that can then be shared *(on page 321)*).

Global options are stored locally in option files (for example, `oxyOptionsSa19.1.xml` for a standalone distribution of Oxygen XML Editor version 19.1) located in the following directories:

- **Windows (7, 8, 10)** - `[user_home_directory]\AppData\Roaming\com.oxygenxml`
- **macOS** - `[user_home_directory]/Library/Preferences/com.oxygenxml`
- **Linux/Unix** - `[user_home_directory]/.com.oxygenxml`

Project Options

If you select **Project Options**, the preferences are stored in the project file (`.xpr`), which can easily be shared with other users *(on page 321)*.

Notice:
Some pages do not have the **Project Options** button, since the options they host might contain sensitive data (passwords, for example), unsuitable for sharing with other users.

Sharing Application Settings *(on page 321)*
Customizing Default Options *(on page 318)*
Importing/Exporting/Resetting Global Options *(on page 323)*

Sharing Application Settings

There are a variety of ways that you can share the settings in Oxygen XML Editor with other members of your team so that you all use a common set of options. This topic describes various possibilities.

Share Settings Through a Project File

Most of the preference pages in Oxygen XML Editor include a **Project Options** *(on page 3423)* button that allows you to pass changes to the settings to the current project file that is opened in the **Project** view *(on page 413)*. That project file can then be shared with other users. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have access to the same option configuration that you stored in the project file.

For more information about sharing projects, see Sharing a Project - Team Collaboration *(on page 425)*.

Share Settings by Exporting/Importing Global Options

Oxygen XML Editor includes actions in the **Options** menu that allow you to export and import the global settings *(on page 3420)*. The **Export Global Options** action will save the global settings as an XML properties file. You can then share those settings with others by using the **Import Global Options** action to import that properties file on their computer.

For more information about global options, see Importing/Exporting/Resetting Global Options *(on page 323)*.

Share Settings with a Custom Options File During Installation

When Oxygen XML Editor in installed, all the settings are set to default values. You can customize the set of default values by creating an XML *options file* that you will use when installing Oxygen XML Editor on each computer. You can then copy the XML options file to the installation directory or specify its path in a startup parameter.

For more information about creating and referencing a custom options file, see Customizing Default Options *(on page 318)*.

Share Settings by Imposing Fixed Options with an API

The Maven-based Oxygen XML SDK includes a sample *plugin* called **ImposeOptions** that imposes a fixed set of options when the application starts. This can be achieved by using the *PluginWorkspaceProvider.getPluginWorkspace().setGlobalObjectProperty(key, value)* API method.

For more information about this API, see PluginWorkspaceProvider Class.

Sharing Validation Scenarios *(on page 819)*
Customizing Default Options *(on page 318)*
Importing/Exporting/Resetting Global Options *(on page 323)*
Sharing a Framework *(on page 2406)*

Importing/Exporting/Resetting Global Options

Actions for importing, exporting, and resetting global options are available in the **Options** menu. The export operation allows you to save global preferences *(on page 3420)* as an XML properties file and the import operation allows you to load the property file. You can use this file to reload saved options on your computer or to share with others *(on page 320)*.

The following actions are available in the **Options** menu:

Reset Global Options

Restores the preference to the factory defaults or to customized defaults *(on page 318)*. This action also resets the transformation and validation scenarios to the default scenarios and clears recently used document templates.

Import Global Options

Allows you to import a set of *Global Options* from an exported XML properties file. You can also select a project-level options file *(on page 426)* (`.xpr`) to import all the *Global Options* that are set in that project file. After you select a file, the **Import Global Options** dialog box is displayed, and it informs you that the operation will only override the options that are included in the imported file. You can select the **Reset all other options to their default values** option to reset all options to the default values before the file is imported.

Export Global Options

Allows you to export *Global Options* to an XML properties file. Some user-specific options that are private are not included. For example, passwords and the name of the *Review Author* is not included in the export operation.

Oxygen XML Editor automatically stores your global options in an XML properties file. Depending on the platform you are using, this file is located in the following directories:

- `[user-home-folder]\AppData\Roaming\com.oxygenxml` for Windows
- `[user-home-folder]/Library/Preferences/com.oxygenxml` for macOS
- `[user-home-folder]/.com.oxygenxml` for Linux

The name of the `options` file of Oxygen XML Editor 26.1 is oxyOptionsSa26.1.xml.

Configuring the Layout of the Views and Editors

All of the side-views available in Oxygen XML Editor are *dockable (on page 3418)* and there are various ways to configure and arrange the layout of the views and editing panes. You can also configure the layout of the toolbars *(on page 374)*.

To open a view, select it from the **Window > Show View** menu. You can hide a view by closing it with the ✕ button at the top-right corner of the view, or with the **Window > Hide current view** action.

Arranging the Layout

You can drag any view to any margin of another view or editor inside the Oxygen XML Editor window. Once you create a layout that suits your needs, you can save it from **Window > Export Layout**. Oxygen XML Editor creates a layout file containing the preferences of the saved layout. To load a layout, go to **Window > Load Layout**. To reset it, select **Window > Reset Layout**.

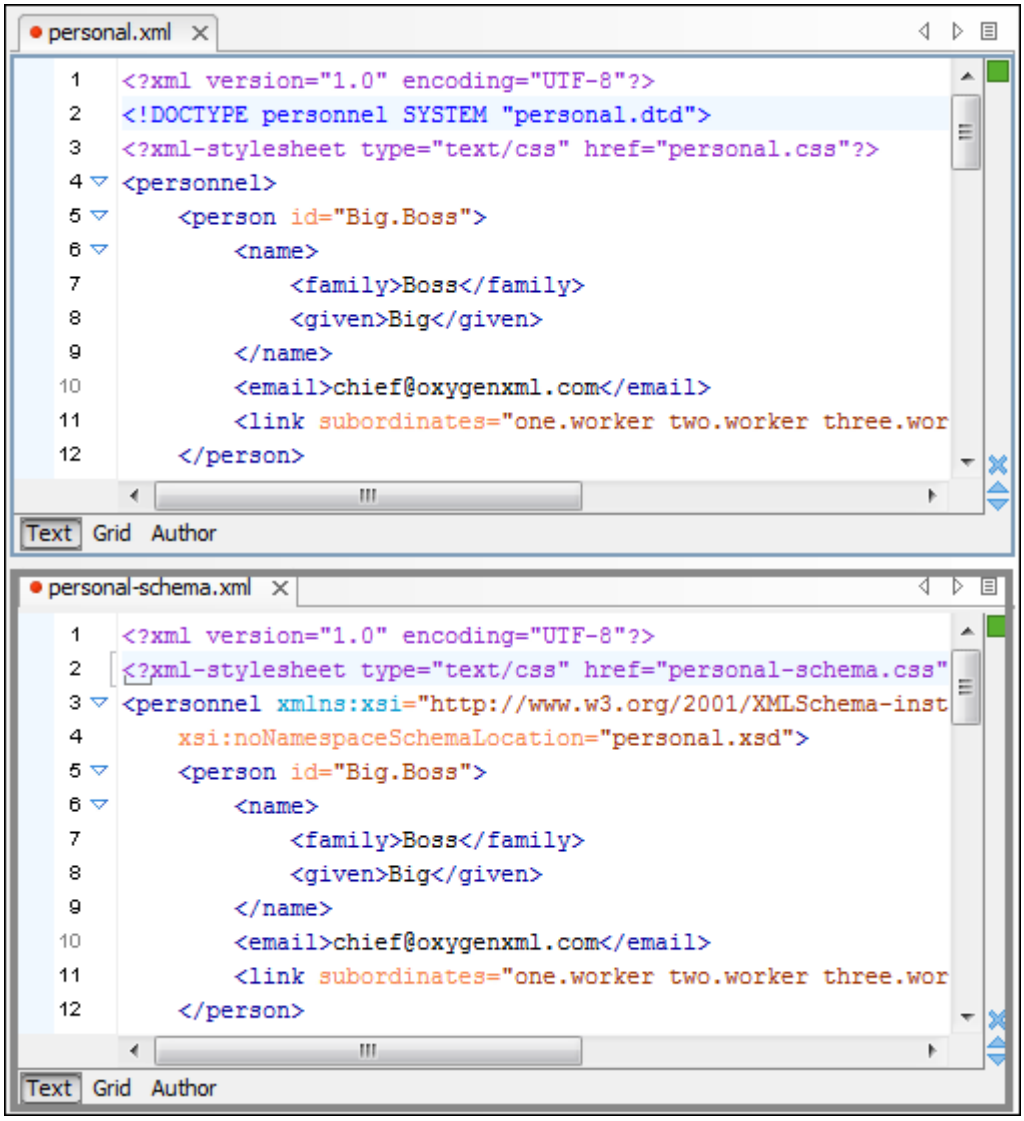
Note:
The **Load Layout** menu lets you select between the default layout, a predefined layout, or a custom layout. The changes you make using the **Load Layout** menu are also reflected in the **Application Layout** preferences page.

The changes you make to any layout are preserved between working sessions. The predefined layout files are saved in the preferences directory *(on page 132)* of Oxygen XML Editor.

You can drag the editors and arrange them in any order, both horizontally and vertically.

The following image presents two editors arranged as horizontal tiles. To arrange them vertically, drag one of them on top of the other. In the following example, the `personal.xml` file was dragged over the `personal-schema.xml` file:

Figure 50. Drag and Drop Editors



Hide or Float Views

Hide

To gain more editing space in the Oxygen XML Editor window, click **Toggle auto-hide** in any view. This button sets the view in the *auto-hide* state, making it visible only as a vertical tab, at the margins of the Oxygen XML Editor window. To display a view in the *auto-hide* state, hover its side-tab with your cursor, or click it to keep the view visible until you click elsewhere.

Float

A view can also be set to a floating state by using the **Toggle floating** action, making it independent from the rest of the Oxygen XML Editor window.

Maximize the Editing Environment

You can configure the interface to maximize the editing area, leaving more vertical screen space available for the main editing pane. This is, for example, useful for presentations on low-resolution screens or for laptops

with small screen space. You can use the following two actions that are available in the **Window** menu to create a near full-screen editing environment:

Maximize Editor Area

If toggled on, all side views are minimized to give you more horizontal space in the editing pane.

Hide All Toolbars

If toggled on, all toolbar buttons are hidden to give you more vertical space in the interface.

Tile/Stack Editor Actions

You can also tile or stack all open editors using the following actions from the toolbar or **Window** menu:

Tile Editors Horizontally

Splits the editing area into horizontal tiles, one for each open file.

Tile Editors Vertically

Splits the editing area into vertical tiles, one for each open file.

Stack Editors

The reverse of the **Tile Editors Horizontally/Vertically** actions. Stacks all open editors.

Synchronous Scrolling

Select this action to scroll through the tiled editors at the same time.

Note:
When tiled, you can still drag and drop the editors, but note that they are docked in the same way as a window/view (instead of just tabs). You are actually rearranging the editor windows, so drag the editor tab and drop it to one of the sides of an editor (left/right/top/bottom). While dragging, you will see the dark gray rectangle aligned to one of the sides of the editor, or around the entire editor window. If you drop it to one of the sides, it will dock to that side of the editor. If you drop it when the rectangle is around the entire window of the editor, it will get stacked on top of that editor. You can also grab one of the stacked editors and tile it to one of the sides.

Split Editor Actions

You can divide the editing area vertically and horizontally using the following actions available in the toolbar and **Window** menu:

- **Split Editor Horizontally** - Splits the editor horizontally so that two editor panes are displayed with one on top of the other. This is useful for comparing and merging content between two documents.
- **Split Editor Vertically** - Splits the editor vertically so that two editor panes are displayed side by side. This is useful for comparing and merging content between two documents.
- **Unsplit Editor** - Removes a split action on the editing area.

To maximize or restore the editors, go to **Window > Maximize Editing Area**.

Switch, Move, or Hide Editor Tabs

Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them, and you can even hide the tabs to only show the currently open file.

Note:
If multiple file tabs are left open when you close the application, upon startup, Oxygen XML Editor will not load the file content until you switch to the corresponding file tab. The tabs remain visible as a placeholders until the focus is switched to them. This helps to improve the application's startup time. If you want to disable this feature (meaning that the previously open files will all be re-loaded at startup), deselect the **Load file content only when switching to its corresponding editor tab** option in the **Global** preferences page *(on page 134)*.

Switching Editor Tabs

You can switch between editor tabs by using any of the following methods:

Mouse and Scroll Wheel

Of course, you can switch to a different editor tab by left-clicking the tab with your mouse, but when there are too many open tabs to fit on the screen, you can hover over the tab stripe and use the scroll wheel on your mouse to scroll to the left or right (same as using the two arrows on the far-right of the tab stripe).

Buttons on the Far-Right of the Tab Stripe (◂▸☰)

You can use the arrow buttons (◂▸) on the right side of the tab stripe to scroll to the left or right and the ☰ **Show List** button opens a pop-up window that displays all the open file tabs and allows you to select and switch to a specific open file.

Ctrl + Tab (Command + Tab on macOS) [NOTE: Ctrl + Page Down (Ctrl + Option + Right Arrow on macOS) does the same]

Switches to the next open tab in the order specified in the **Order of switching between editor tabs** option *(on page 135)*.

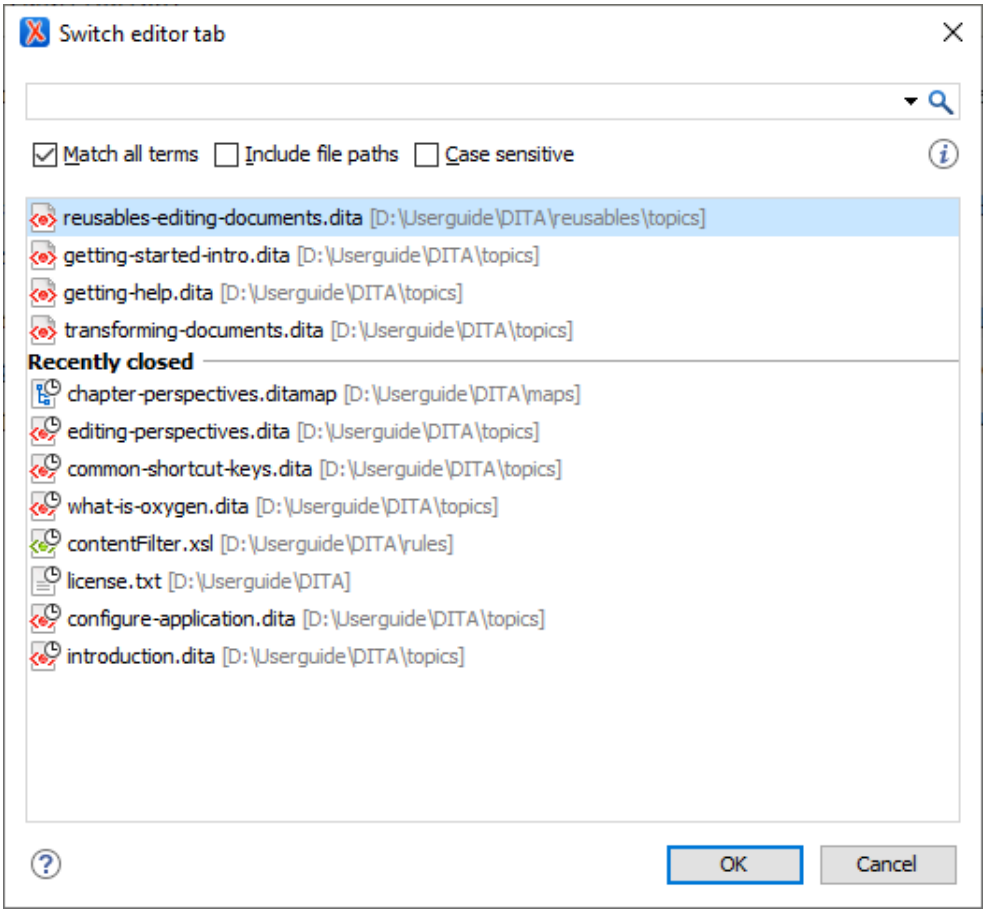
Ctrl + Shift + Tab (Command + Shift + Tab on macOS) [NOTE: Ctrl + Page Up (Ctrl + Option + Left Arrow on macOS) does the same]

Switches to the previous open tab in the order specified in the **Order of switching between editor tabs** option *(on page 135)*.

Window > Switch editor tab (Ctrl + F9 (Command + F9 on macOS))

This action opens a dialog box that allows you to switch to a particular editor tab by selecting it from a filterable list. This is especially helpful when you have a large amount of open file tabs and you want to switch to a certain tab this is not shown on the screen. It includes a search filter field and several options to help you find specific open file tabs.

Figure 51. Switch Editor Tab Dialog Box



The **Switch Editor Tab** dialog box contains the following options and features:

Search Filter

You can enter text in the filter field at the top of the dialog box to filter the list and search for specific open files. You can enter any number of terms, separated by space, and wildcards are allowed (for example, `*` to match any sequence of characters, or `?` to match a single character). This field also has a history drop-down that allows you to select previously used search terms.

Match all terms

If this option is selected, only the files that match all of your search terms will be displayed. If you use a wildcard in the search filter, this option is automatically disabled.

Include file paths

If this option is selected, the search is expanded to include file paths, and also the paths are displayed in this dialog box.

Case sensitive

If this option is selected, the search operation will be case-sensitive.

List of Open File Tabs

All files that are currently open are displayed in the upper part of the main pane of the dialog box, followed by recently closed files. Files that have been modified but not yet saved are prefixed by an asterisk. To switch to a particular file tab, double-click the file or select it and click **OK**.

Moving Editor Tabs

You can move editor tabs by using any of the following methods:

Mouse Drag

You can use your mouse to drag editor tabs to a new location on the tab stripe.

Ctrl + Alt + Comma

Moves the current file tab one position to the left.

Ctrl + Alt + Period

Moves the current file tab one position to the right.

Hiding Editor Tabs

If you want to hide all the file tabs and only show the currently open file, select **Hide editor tabs** from the **Window** menu. This does not close the other tabs, just hides them. You can still navigate between tabs using keyboard shortcuts (**Ctrl + Tab**, **Ctrl + Shift + Tab**, **Ctrl + F6**, **Ctrl + Shift + F6**) or by selecting **Next editor** or **Previous editor** from the **Window** menu.

For more information about configuring the interface of Oxygen XML Editor, watch our video demonstration:

https://www.youtube.com/embed/anwjepfAdEk

Tip:
To get more ideas for more advanced customization possibilities, watch our Webinar: **Working with DITA in Oxygen - Customizing the Editing Experience**. It offers a visual demonstration of how to customize actions, document validation, content completion, new document templates, **Author** mode rendering, and more.

Related information
Configuring Toolbars *(on page 374)*

Configuring Toolbars

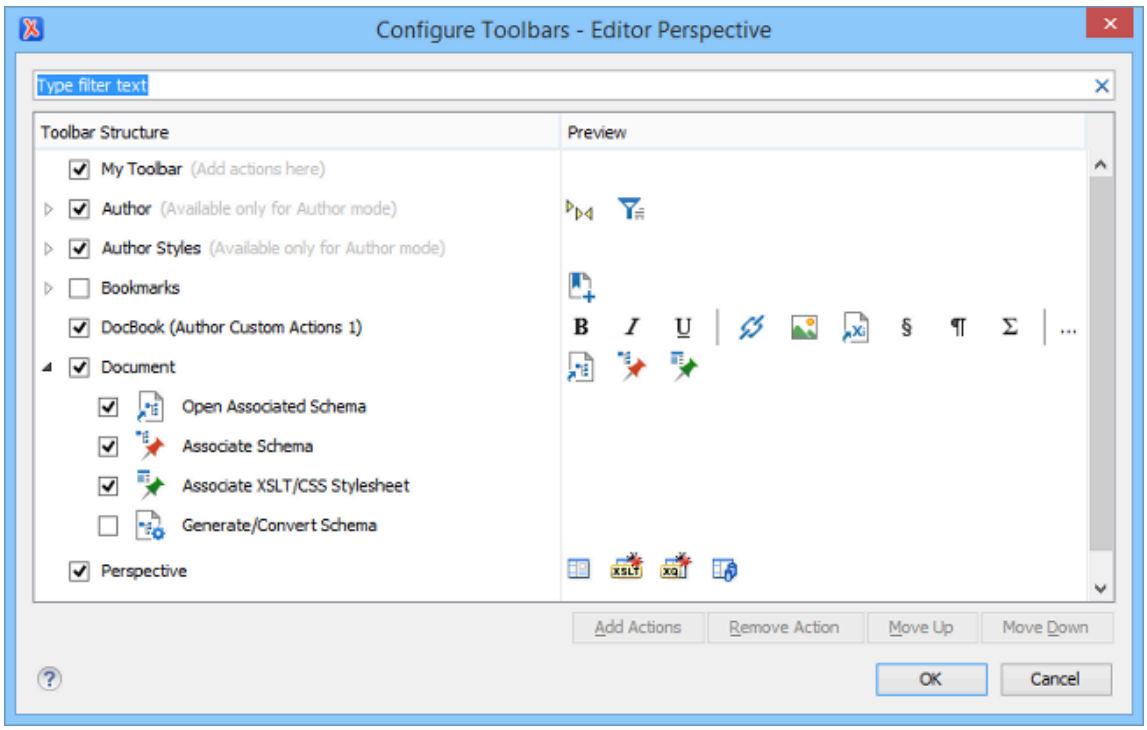
You can configure the toolbars in Oxygen XML Editor to personalize the interface for your specific needs. You can choose which toolbars to show or hide in the current editor mode (**Text**, **Author**,**Design**, or **Grid**) and in the current *perspective (on page 3422)* (**Editor**, **XSLT Debugger**, **XQuery Debugger**, or **Databse**). You can

also choose which actions to display in each toolbar, add actions to toolbars, and customize the layout of the toolbars.

To configure the toolbars, open the **Configure Toolbars** dialog box by doing one of the following:

- Right-click any toolbar and select **Configure Toolbars**.
- Select **Configure Toolbars** from the **Window** menu.

Figure 52. Configure Toolbars Dialog Box



The **Configure Toolbars** dialog box provides the following features:

Filter Text Box

You can use the filter text box at the top of the dialog box to search for a specific toolbar or action.

Show or Hide Toolbars

You can choose whether to show or hide a toolbar by using the checkbox next to the toolbar name. This checkbox is only available for toolbars that are available for the current *perspective (on page 3422)* and editing mode.

Show or Hide Actions in a Toolbar

To show or hide actions in a toolbar, expand it by clicking the arrow next to the toolbar name, then use the checkbox to select or deselect the appropriate actions. The toolbar configuration changes in the **Preview** column according to your changes.

Add Actions to a Toolbar

Use the **Add Actions** button to open the **Add Actions** dialog box that displays all the actions that can be added to any of the toolbars, with the exception of those that are contributed from *frameworks (on page 3420)* or 3rd party *plugins (on page 3422)*.

Remove Actions from a Toolbar

You can remove actions that you have previously added to toolbars by using the **Remove Action** button.

Move Actions in a Toolbar

Use the **Move Up** and **Move Down** actions to change the order of the actions in a toolbar.

The **Configure Toolbars** dialog box also provides a variety of other ways to customize the layout in Oxygen XML Editor.

Customize My Toolbar

You can customize the **My Toolbar** to include your most commonly used actions. By default, this toolbar is listed first. Also, it is hidden until you add actions to it and you can easily hide it with the **Hide "My Toolbar" Toolbar** action that is available when you right-click anywhere in the toolbar area.

Drop-down Menu Actions

Composite actions that are usually displayed as a drop-down menu can only be selected in one toolbar at a time. These actions are displayed in the **Configure Toolbars** dialog box with the name in brackets.

Configure External Tools Action

There is a **Configure external tools** composite action that appears in the toolbar called **Tools**. It is a drop-down menu that contains any external tools that are configured in the **External Tools** preferences page.

Note:
If no external tools are configured, this drop-down menu is not shown in the toolbar.

Additional actions are available from the **Window** menu or contextual menu when invoked from a toolbar that allows you to further customize your layout. These actions include:

Reset Toolbars

To reset the layout of toolbars to the default setting, select the **Reset Toolbars** action from the contextual menu or **Window** menu.

Reset Layout

To reset the entire layout (including toolbars, editing modes, views, etc.) to the default setting, select **Reset Layout** from the contextual menu or **Window** menu.

Export Layout

You can use the **Export Layout** action that is available in the **Window** menu to export the entire layout of the application to share it with other users.

Hide Toolbars

You can use the **Hide Toolbar** action from the contextual menu to easily hide a displayed toolbar. When you right-click a toolbar it will be highlighted to show you which actions are included in that toolbar.

Related information

Configuring the Layout of the Views and Editors *(on page 369)*

Import/Export Transformation or Validation Scenarios

You can export global transformation and validation scenarios into specialized *scenarios* files. You can import transformation and validation scenarios from various sources (such as project files, *framework (on page 3420)* option files, or exported scenario files). The import and export scenario actions are available in the **Options** menu. The following actions are available:

Import Transformation Scenarios

Loads a set of transformation scenarios from a project file, *framework* options file, or exported scenarios file.

Export Global Transformation Scenarios

Stores a set of global transformation scenarios in a specialized *scenarios* file.

Import Validation Scenarios

Loads a set of validation scenarios from a project file, *framework* options file, or exported scenarios file.

Export Global Validation Scenarios

Stores a set of global validation scenarios in a specialized *scenarios* file.

The **Export Global Transformation Scenarios** and **Export Global Validation Scenarios** options are used to store all the scenarios in a separate file. Associations between document URLs and scenarios are also saved in this file. You can load the saved scenarios using the **Import Transformation Scenarios** and **Import Validation Scenarios** actions. To distinguish the existing scenarios and the imported ones, the names of the imported scenarios contain the word *import*.

Editor Variables

An editor variable is a shorthand notation for context-dependent information, such as a file or folder path, a time-stamp, or a date. It is used in the definition of a command (for example, the input URL of a transformation, the output file path of a transformation, or the command line of an external tool) to make a command or a parameter generic and re-usable with other input files. When the same command is applied

to multiple files, the notation is expanded at the execution of the command so that the same command has different effects depending on the actual file.

Oxygen XML Editor includes a variety of built-in editor variables. You can also create your own custom editor variables by using the **Custom Editor Variables** preferences page *(on page 309)*.

Editor variables are evaluated and automatically expanded in many places in the application, when:

- Creating new documents from file templates *(on page 385)*.
- Inserting code templates *(on page 385)* in the **Text** or **Author** editor modes.
- Running custom configured External Tools *(on page 3029)*.
- Executing predefined Built-in Author Mode Operations *(on page 2269)* that have editor variables given as parameter values.
- Running validation scenarios *(on page 809)* that use editor variables inside to reference various resources.
- Executing transformation scenarios (of type ANT, DITA-OT *(on page 3297)*, XSLT *(on page 1505)*, etc.) that have editor variables set as parameter values or as values for references to various resources.
- Expanding CSS imports *(on page 2426)* for editing in the **Author** visual editing mode.
- Using specific Java API `UtilAccess.expandEditorVariables(String, URL)` from plugins and framework extensions.

You can use the following editor variables in Oxygen XML Editor commands of external engines or other external tools, and in various places in the application, such as in transformation scenarios, **Author** mode operations, and validation scenarios:

- **${activeConditionSet}** - Current active profiling condition set *(on page 686)* name. If there is no active condition set, the variable will be replaced with an *empty string*.
- **${af}** - The local file path of the ZIP archive that includes the currently edited document.
- **${afd}** - The local directory path of the ZIP archive that includes the currently edited document.
- **${afdu}** - The URL path of the directory of the ZIP archive that includes the currently edited document.
- **${afn}** - The file name (without parent directory and without file extension) of the zip archive that includes the currently edited file.
- **${afne}** - The file name (with file extension, for example `.zip` or `.epub`, but without parent directory) of the zip archive that includes the currently edited file.
- **${afu}** - The URL path of the ZIP archive that includes the currently edited document.

- **${answer(@id)}** - Used in conjunction with the **${ask}** editor variable. The **@id** parameter is required and identifies the answer from the **${ask}** editor variable with the same ID.

  Example:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="topic_lcf_1c4_tdb">
    <title></title>
```

```
    <body>
        <data name="${ask('Set a data name', String, 'name', @name)}"></data>
        <p>The name is: ${answer(@name)}</p>
    </body>
</topic>
```

- **${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value', @id)}** - To prompt for values at runtime, use the *ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value')* editor variable. You can set the following parameters:
  - **'message'** - The displayed message. Note the quotes that enclose the message.
  - **'default-value'** - Optional parameter. Provides a default value.
  - **@id** - Optional parameter. Used for identifying the variable to reuse the answer using the **${answer(@id)}** editor variable.
  - **type** - Optional parameter (defaults to **generic**), with one of the following values:

Note:

The title of the dialog box will be determined by the type of parameter and as follows:

- For *url* and *relative_url* parameters, the title will be the name of the parameter and the value of the *'message'*.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

Notice:

Editor variables that are used within a parameter of another editor variable must be escaped within single quotes for them to be properly expanded. For example:

```
${ask( 'Provide a date',generic,'${date(yyyy-MM-dd'T'HH:MM)}')}
```

Parameter	
generic (default)	**Format**: *${ask('message', generic, 'default')}*
	Description: The input is considered to be generic text that requires no special handling.
	Example: ▪ *${ask('Hello world!')}* - The dialog box has a *Hello world!* message displayed. ▪ *${ask('Hello world!', generic, 'Hello again!')}* - The dialog box has a *Hello world!* message displayed and the value displayed in the input box is *'Hello again!'*.
url	**Format:** *${ask('message', url, 'default_value')}*

Parameter	
	Description: Input is considered a URL. Oxygen XML Editor checks that the provided URL is valid.
	Example: ▪ *${ask('Input URL', url)}* - The displayed dialog box has the name *Input URL*. The expected input type is URL. ▪ *${ask('Input URL', url, 'http://www.example.com')}* - The displayed dialog box has the name *Input URL*. The expected input type is URL. The input field displays the default value *http://www.example.com*.
relative_url	**Format:** *${ask('message', relative_url, 'default')}*
	Description: Input is considered a URL. This parameter provides a file chooser, along with a text field. Oxygen XML Editor tries to make the URL relative to that of the document you are editing. **Note:** If the *$ask* editor variable is expanded in content that is not yet saved (such as an *untitled* file, whose path cannot be determined), then Oxygen XML Editor will transform it into an absolute URL.
	Example: *${ask('File location', relative_url, 'C:/example.txt')}* - The dialog box has the name *'File location'*. The URL inserted in the input box is made relative to the currently edited document location.
password	**Format**: *${ask('message', password, 'default')}*
	Description: The input is hidden with bullet characters.
	Example: ▪ *${ask('Input password', password)}* - The displayed dialog box has the name *'Input password'* and the input is hidden with bullet symbols. ▪ *${ask('Input password', password, 'abcd')}* - The displayed dialog box has the name *'Input password'* and the input hidden with bullet symbols. The input field already contains the default **abcd** value.
combobox	**Format:** *${ask('message', combobox, ('real_value1':'rendered_value1';..-.;'real_valueN':'rendered_valueN'), 'default')}*

Parameter	
	Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given *rendered_value* values. Choosing such a value will return its associated value (*real_value*). **Note:** The list of *'real_value':'rendered_value'* pairs can be computed using *${xpath_eval()}*. **Note:** The *'default'* parameter specifies the default-selected value and can match either a key or a value.
	Example: ▪ *${ask('Operating System', combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}* - The dialog box has the name *'Operating System'*. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection. **Note:** In this example, the default value is indicated by the *osx* key. However, the same result could be obtained if the default value is indicated by *macOS*, as in the following example: *${ask('Operating System', combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macOS')}* ▪ *${ask('Mobile OS', combobox, ('ios':'iOS';'and':'Android'), 'Android')}* ▪ *${ask('Mobile OS', combobox, (${xpath_eval(for $pair in (['ios', 'iOS'], ['and', 'Android']) return '"' || $pair?1 || '":"' || $pair?2 || '";')}), 'ios')}*
editable_combobox	**Format:** *${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}*
	Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given *rendered_value* values. Choosing such a value will return its associated real value (*real_value*) or the value inserted when you edit a list entry.

Parameter	
	Note: The list of *'real_value':'rendered_value'* pairs can be computed using *${xpath_eval()}*. **Note:** The *'default'* parameter specifies the default-selected value and can match either a key or a value. **Example:** ▪ *${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}* - The dialog box has the name *'Operating System'*. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input. ▪ *${ask('Operating System', editable_combobox, (${xpath_eval(for $pair in (['win', 'Microsoft Windows'], ['macos', 'macOS'], ['lnx', 'Linux/UNIX']) return '"' || $pair?1 || '":"' || $pair?2 || '";")}), 'ios')}*
radio	**Format:** *${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}* **Description:** Displays a dialog box that offers a series of radio buttons. Each radio button displays a *'rendered_value* and will return an associated *real_value*. **Note:** The list of *'real_value':'rendered_value'* pairs can be computed using *${xpath_eval()}*. **Note:** The *'default'* parameter specifies the default-selected value and can match either a key or a value. **Example:**

Parameter	
	▪ *${ask('Operating System', radio, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}* - The dialog box has the name *'Operating System'*. The radio button group allows you to choose between the three operating systems. **Note:** In this example, `macOS` is the default-selected value and if selected, it would return *macos* for the output. ▪ *${ask('Operating System', radio, (${xpath_eval(for $pair in (['win', 'Microsoft Windows'], ['macos', 'macOS'], ['lnx', 'Linux/UNIX']) return '"' || $pair?1 || '":"' || $pair?2 || '";')}), 'ios')}*

- **${author.name}** - Expands to the current author name that is set in the **Review** preferences page *(on page 191)*.
- **${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a **selection** *plugin*.

Note:
The **${caret}** editor variable is available only for parameters that take XML content as values. It is replaced with the **${UNIQUE_CARET_MARKER_FOR_AUTHOR}** macro. The default Author operations process this macro and position the cursor at the designated offset.

Note:
The **${caret}** editor variable can be used for setting a fixed cursor position inside an XML fragment. To set the cursor position depending on the fragment inserted in the document, you can use **AuthorDocumentFilter** and inside the **insertFragment(AuthorDocumentFilterBypass, int, AuthorDocumentFragment)** method, use the **AuthorDocumentFragment.setSuggestedRelativeCaretOffset(int)** API on the given fragment.

- **${cf}** - Current file as file path, that is the absolute file path of the currently edited document.
- **${cfd}** - Current file folder as file path, that is the path of the currently edited document up to the name of the parent folder.
- **${cfdu}** - Current file folder as URL, that is the path of the currently edited document up to the name of the parent folder, represented as a URL.
- **${cfn}** - Current file name without the extension and parent folder. The current file is the one currently open and selected.
- **${cfne}** - Current file name with extension. The current file is the one currently open and selected.

- **${comma}** - Used to display a comma when the actual comma symbol would be considered part of some sort of instruction or delimiter.
- **${configured.ditaot.dir}** - The default directory of the DITA Open Toolkit distribution, as configured in the **DITA** preferences page *(on page 277)*.
- **${cp}** - Current page number. Used to display the current page number on each printed page in the **Editor / Print** Preferences page.
- **${currentFileURL}** - Current file as URL, that is the absolute file path of the currently edited document represented as URL.
- **${date(pattern)}** - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. **Example:** *yyyy-MM-dd*.

Note:
This editor variable supports both the **xs:date** and **xs:datetime** parameters. For details about **xs:date**, go to: http://www.w3.org/TR/xmlschema-2/#date. For details about **xs:datetime**, go to: http://www.w3.org/TR/xmlschema-2/#dateTime.

- **${dbgXML}** - The local file path to the XML document that is currently selected in the Debugger source combo box (for tools started from the XSLT/XQuery Debugger).
- **${dbgXSL}** - The local file path to the XSL/XQuery document that is currently selected in the Debugger stylesheet combo box (for tools started from the XSLT/XQuery Debugger).
- **${dita.dir.url}** - A special local contextual editor variable that gets expanded only in the **Libraries** dialog box that is accessible from the **Advanced** tab of DITA transformation scenarios. The **Libraries** dialog box allows you to specify additional libraries (*JAR (on page 3420)* files or additional class paths) to be used by the transformer. This *${dita.dir.url}* editor variable gets expanded to the value of the *dita.dir* parameter from the **Parameters** tab of the DITA transformation scenario.
- **${ds}** - The path of the detected schema as a local file path for the current validated XML document.
- **${dsu}** - The path of the detected schema as a URL for the current validated XML document.
- **${env(VAR_NAME)}** - Value of the *VAR_NAME* environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **${system(var.name)}** editor variable.
- **${framework(fr_name)}** - The path (as URL) of the *fr_name* framework.
- **${framework}** - The path (as URL) of the current `framework` directory.
- **${frameworkDir(fr_name)}** - The path (as file path) of the *fr_name* framework.

Note:
Since multiple *frameworks* might have the same name (although it is not recommended), for both *${framework(fr_name)}* and *${frameworkDir(fr_name)}* editor variables Oxygen XML Editor employs the following algorithm when searching for a given *framework* name:

- All *frameworks* are sorted, from high to low, according to their **Priority** *(on page 148)* setting from the **Document Type** configuration dialog box *(on page 147)*. Only *frameworks* that have the **Enabled** checkbox selected are taken into account.
- Next, if the two or more *frameworks* have the same name and priority, a further sorting based on the **Storage** setting is made, in the exact following order:
  - *Frameworks* stored in the internal Oxygen XML Editor options.
  - Additional *frameworks* added in the **Locations** preferences page *(on page 147)*.
  - *Frameworks* installed using the add-ons support.
  - *Frameworks* found in the main *framework* location *(on page 147)* (**Default** or **Custom**).

- **${frameworkDir}** - The path (as file path) of the current `framework` directory.
- **${frameworks}** - The path (as URL) of the `frameworks` directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main frameworks folder defined in the **Document Type Association > Locations** preferences page.
- **${frameworksDir}** - The path (as file path) of the `frameworks` directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main `frameworks` folder defined in the **Document Type Association > Locations** preferences page.
- **${home}** - The path (as URL) of the user home folder.
- **${homeDir}** - The path (as file path) of the user home folder.
- **${i18n(key)}** - Editor variable used only at *framework*-level to allow translating names and descriptions of **Author** mode actions in multiple actions. For more details, see Localizing Frameworks *(on page 2347)*.
- **${id}** - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- **${makeRelative(base,location)}** - Takes two URL-like paths as parameters and tries to return a relative path. A use-case would be to insert content references to a certain reusable component when defining code templates.

  Example:

  ```
  ${makeRelative(${currentFileURL}, ${dictionaryURL}#gogu)}
  ```

- **${oxygenHome}** - Oxygen XML Editor installation folder as URL.c
- **${oxygenInstallDir}** - Oxygen XML Editor installation folder as file path.
- **${pd}** - The file path to the folder that contains the current project file (`.xpr`).
- **${pdu}** - The URL path to the folder that contains the current project file (`.xpr`).
- **${pluginDir(pluginID)}** - Each plugin has an ID specified in its `plugin.xml` file. This editor variable expands to the file path of the folder that contains the `plugin.xml` file where that specific plugin ID is located.

- **${pluginDirURL(pluginID)}** - Each plugin has an ID specified in its `plugin.xml` file. This editor variable expands to the URL path of the folder that contains the `plugin.xml` file where that specific plugin ID is located.
- **${pn}** - Current project name.
- **${ps}** - Path separator, which is the separator that can be used on the current platform (Windows, macOS, Linux) between library files specified in the class path.
- **${rootMapDir}** - Will be expanded to the current root map parent directory file path.
- **${rootMapDirURL}** - Will be expanded to the current root map parent directory URL.
- **${rootMapFile}** - Will be expanded to the current root map file path.
- **${rootMapURL}** - Will be expanded to the current root map URL. For example, if in the main DITA Map you define a key with a certain value:

  ```
  <keydef keys="test">
    <topicmeta><keywords><keyword>ABC</keyword></keywords></topicmeta>
  </keydef>
  ```

  you can modify a DITA-OT publishing parameter to have the value: `${xpath_eval(doc('${rootMapURL}')//keydef[@keys='test']/keywords/keyword/text())}`. It will be expanded to the value of that specified key name.
- **${selection}** - The currently selected text content in the currently edited document. This variable can be used in a code template, in **Author** mode operations, or in a **selection** *plugin*.
- **${system(var.name)}** - Value of the *var.name* Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as *-Dvar.name=var.value*. If you are looking for operating system environment variables, use the **${env(VAR_NAME)}** editor variable instead.
- **${timeStamp}** - The timestamp, which is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- **${tp}** - Total number of pages in the document. Used to display the total number of pages on each printed page in the **Editor / Print** Preferences page.
- **${tsf}** - The transformation result file path. If the current opened file has an associated scenario that specifies a transformation output file, this variable expands to it.
- **${uuid}** - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.
- **${xmlCatalogFilesList}** - A list of file paths that point to all known XML catalog files, separated by semi-colons (;).
- **${xpath_eval(expression)}** - Evaluates an XPath expression. Depending on the context, the expression can be:

  - **static** - When executed in a non-XML context. For example, you can use such static expressions to perform string operations on other editor variables for composing the name of the output file in a transformation scenario's **Output** tab.

    Example:

    ```
    ${xpath_eval(upper-case(substring('${cfn}', 1, 4)))}
    ```

- **dynamic** - When executed in an XML context. For example, you can use such dynamic expression in a code template or as a value of a parameter of an **Author** mode operation.

  Example:

  ```
  ${ask('Set new ID attribute', generic, '${xpath_eval(@id)}')}
  ```

Selection Plugin Extension *(on page 2555)*

Installing and Updating Add-ons *(on page 126)*

Custom Editor Variables

An editor variable *(on page 332)* can be created and included in any user-defined expression where a built-in editor variable is also allowed. For example, a custom editor variable may be necessary for configuring the command line of an external tool, the working directory of a custom validator, the command line of a custom XSLT engine, or a custom FO processor.

You can create or configure custom editor variables in the **Custom Editor Variables** preferences page *(on page 309)*. To create a custom editor variable, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Custom Editor Variables**.
2. Click the **New** button at the bottom of the table.
3. Use the subsequent dialog box to specify the **Name**, **Value**, and **Description** for the new editor variable.
4. Click **OK** to save your configuration.

Related information

Editor Variables *(on page 332)*

Custom System Properties

A variety of Java system properties can be set in the application to influence its behavior. For information about how to do this, see Setting a System Property *(on page 350)*.

com.oxygenxml.disable.http.protocol.handlers

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** By default, Oxygen XML Editor uses the open source Apache HTTP Client software for HTTP(S) connections. If set to `True`, the default Java Sun HTTP(S) will be used instead. You will also lose **WebDAV** support and possibly other related features.

com.oxygenxml.present.license.reminders

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** When set to `false`, Oxygen XML Editor will not display the messages that remind you to renew your Support and Maintenance Pack that covers your current license.

com.oxygenxml.enable.content.reference.caching

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** Enables content reference caching.

com.oxygenxml.eclipse.remove.grid.editing.mode

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** When set to `false`, Oxygen XML Editor does not show the Grid editing mode when opening an XML document.

com.oxygenxml.default.java.accessibility

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** System property that can be set to `true` to force the default detection of java accessibility. If *com.sun.java.accessibility.AccessBridge* cannot be loaded, Oxygen XML Editor forces the Java accessibility to be disabled.

com.oxygenxml.floating.license.timeout

- **Allowed Values:** An integer (minutes)
- **Default Value:** `120`
- **Purpose:** Stores the time interval (in minutes) before floating licenses are released in case of application's inactivity.

com.oxygenxml.language

- **Allowed Values:** Language code (for example, `en-us`)
- **Default Value:** N/A
- **Purpose:** Property that holds the language code set during installation.

com.oxygenxml.default.options

- **Allowed Values:** A URL-type relative or absolute path.
- **Default Value:** N/A
- **Purpose:** Provides the path to an XML file containing default application options. For more details, see Customizing Default Options *(on page 318)*.

com.oxygenxml.customOptionsDir

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** N/A
- **Purpose:** Sets a folder to be used by the application to load and save preference files. The default location where the options are saved varies according to the operating system. For more details, see Importing/Exporting/Resetting Global Options *(on page 323)*.

com.oxygenxml.ApplicationDataFolder **(Windows only)**

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** `%APPDATA%`
- **Purpose:** When the application runs on Windows, you can set this property to change the location where the application considers that the *APPDATA* folder is located.

com.oxygenxml.editor.frameworks.url

- **Allowed Values:** A URL-type absolute path.
- **Default Value:** `OXYGEN_DIR \frameworks`
- **Purpose:** Changes the folder where the application considers that the main *frameworks* are installed. It has the same effect as changing the custom *frameworks* directory value in the **Location** preferences page *(on page 147)*.

com.oxygenxml.editor.plugins.dir

- **Allowed Values:** The path can be specified with any of the following:
  - A URL or file path that is relative to the application's installation folder (for example: `-Dcom.oxygenxml.editor.plugins.dir=my-plugins`).
  - A system variable that specifies the file path (for example: `-Dcom.oxygenxml.editor.plugins.dir=${system(CONFIG)}/plugins`).
  - An environmental variable that specifies the file path (for example: `-Dcom.oxygenxml.editor.plugins.dir=${env(CONFIG)}/plugins`).
- **Default Value:** N/A
- **Purpose:** Specifies the directory where the application finds *plugins* to load.

com.oxygenxml.MultipleInstances

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** If set to `true`, multiple instances of the application are allowed to be started.

com.oxygenxml.xep.location

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** N/A
- **Purpose:** Points to a folder where RenderX XEP is installed. Has the same effect as configuring XEP in the **FO Processors** preferences page *(on page 269)*.

com.oxygenxml.additional.classpath

- **Allowed Values:** A list of *JAR (on page 3420)*-type resources separated by a classpath separator.
- **Default Value:** N/A
- **Purpose:** An additional list of libraries to be used in the application's internal class loader in addition to the libraries specified in the `lib` folder.

com.oxygenxml.user.home **(Windows only)**

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** `USERPROFILE` folder
- **Purpose:** Overwrites the user home directory that was implicitly detected for the application.

com.oxygenxml.use.late.delegation.for.author.extensions

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** All Java extensions in a *framework* configuration are instantiated in a separate class loader. When **true**, the *JAR* libraries used in a certain document type will have priority to resolve classes before delegating to the parent class loader. When **false**, the parent class loader will take precedence.

com.oxygenxml.stack.size.validation.threads

- **Allowed Values:** The number of bytes used for validation threads.
- **Default Value:** `5*1024*1024`
- **Purpose:** Some parts of the application (validation, content completion) that use the Relax NG parser sometimes require a larger *Thread* stack size to parse complex schemas. The default value should be more than enough.

com.oxygenxml.jing.skip.validation.xhtml.data.attrs

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** By default, the Relax NG validation was configured to skip validation for XHTML attributes that start with "data-", which should be skipped from validation according to the XHTML 5 specification.

com.oxygenxml.report.problems.url

- **Allowed Values:** User-defined URL
- **Default Value:** N/A
- **Purpose:** The URL where a problem reported through the **Report Problem** dialog box is sent. The report is sent in XML format using the **report** parameter with the POST HTTP method.

com.oxygenxml.parallel.title.computing.threads

- **Allowed Values:** Integers
- **Default Value:** `4`
- **Purpose:** The number of parallel threads that will be used to compute referenced topic titles. Increasing this value reduces the amount of time it takes to compute topic titles in the **DITA Maps Manager** view.

com.oxygenxml.prefer.plugin.classloader.context.loader

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** Used to instruct the application to use the plugin class loader when there is code that loads content (usually Xerces code) using the thread's class loader. For instance, if you have a plugin that specifies a certain Xerces version and you want to load that version instead of the one from **Oxygen's** `lib` directory.

com.oxygenxml.classic.file.output.stream.save

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** When set to `true`, the files are saved using a Java classic file output stream, which destroys the NTFS alternate data streams set on the file. However, this might prevent data loss in the rare occasions when Oxygen XML Editor saves empty file content over shared network drives.

com.oxygenxml.format.indent.files.parallel

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`

- **Purpose:** By default, when using the **Format and Indent Files** action from the **Project** view, only one thread will be used for the formatter. If the system property is enabled, up to four parallel threads are used by the operation, speeding up the processing when formatting very large or a large amount of documents.

Setting a System Property *(on page 350)*

Localizing the User Interface

Oxygen XML Editor comes with the following built-in languages: English, French, German, Japanese, Dutch, and Chinese. To change the interface language, go to **Options > Preferences > Global** preferences page, then choose the appropriate language from the **Language** drop-down menu.

You can also localize the interface in another language by creating an interface localization file.

How to Create an Interface Localization File

You can change the language of the Oxygen XML Editor user interface by creating an interface localization file:

1. Identify the code for the new language you want to translate the interface. It is composed from a language code (two or three lowercase letters that conform to the ISO 639 standard), followed by an underscore character, and a region code (two or three uppercase letters that conform to the ISO 3166 standard).
2. Write an email to the Oxygen XML Editor support team and ask them to send you the `translation.xml` sample file.
3. Open the `translation.xml` file in Oxygen XML Editor. The file contains all the interface messages that can be translated and is updated at every new release with the latest additions. Here is a small sample of its content:

```
<translation>
    <languageList>
        <language description="English" lang="en_US"/>
    </languageList>
    <key value="New">
        <comment>The File/New action. Creates a new document.</comment>
        <val lang="en_US">New</val>
    </key>
    <key value="New_folder">
        <comment>Creates a folder in the Project View.</comment>
        <val lang="en_US">New Folder</val>
    </key>
    .....
</translation>
```

4. Update the `<language>` element to reflect the new language. For example, set the `@description` attribute to `Spanish` and the `@lang` attribute to `es_ES`.
5. For each `<key>` element, translate the `<comment>` (optional) and `<val>` elements. For example, set the `@lang` attribute to `es_ES`.

   Note:
   After you are finished, the file should look like this:

   ```
   <translation>
       <languageList>
           <language description="Español" lang="es_ES"/>
       </languageList>
       <key value="New">
           <comment>El Archivo / Nueva acción. Crea un nuevo documento.</comment>
           <val lang="es_ES">Nuevo</val>
       </key>
       <key value="New_folder">
           <comment>Crea una carpeta en la vista del proyecto.</comment>
           <val lang="es_ES">Nueva carpeta</val>
       </key>
       .....
   </translation>
   ```

6. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Global**, and select the **Other language** option *(on page 133)*. Browse for the `translation.xml` file.
7. Restart the application.

Adding New Languages to the Interface

Oxygen XML Editor provides a *plugin* extension is available in the **Oxygen SDK** that provides the ability to contribute a new translation language to the interface. By using this *plugin* extension, you can bundle the new language translation and that new language will be available in the **Languages** drop-down menu in the **Options > Preferences > Global** preferences page *(on page 133)*.

Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor

You can set Java Virtual Machine parameters (for example, if you want to increase the maximum amount of memory available) for the Oxygen XML Editor application launchers *(on page 349)* or command-line scripts *(on page 351)*. You can also create a custom startup parameters file *(on page 352)*.

Setting Parameters for the Application Launchers

Increasing the Amount of Memory that Oxygen XML Editor Uses on Windows and Linux

For Windows and Linux installations of Oxygen XML Editor, the startup launchers for the application and its executable internal tools (**Tree Editor**, **XML Schema Regular Expressions Builder**, **Large File Viewer**, **SVN Client**, **Compare Directories**, and **Compare Files**) include a default `.vmoptions` file in the installation directory that contains some startup parameters (such the **-Xmx** parameter, which is used for allocating memory for that particular application). If your installation contains these `.vmoptions` files, you can edit the parameters in them so that the applications will launch with your desired values. **However, if you re-install the application, install an update for the application, or deploy it to other users or machines, those parameters will be reset to their default values**.

To increase the memory available to the Oxygen XML Editor application on Windows:

1. Browse the installation directory of Oxygen XML Editor.
2. Locate the **-Xmx** parameter in the `oxygen26.1.vmoptions` file. If it is located in a directory where you do not have write access, copy the file to another folder (where you do have write access), modify it there, and then copy it back to the original location.

   

   Note:
   The parameters from the `.vmoptions` file are used when you start Oxygen XML Editor with the *oxygen* launcher (or with the desktop shortcut). If you use the command-line script (`<oxygen.bat>` or `<oxygen.sh>`), make sure you use the following procedure instead: Setting Parameters in the Command-Line Scripts *(on page 351)*.

   

   Tip:
   By default, the maximum memory available to the application is about a quarter of the internal memory available on the machine. It is recommended to not use more than half of your existing physical RAM.

3. Restart Oxygen XML Editor. Go to **Help > About** and verify the amount of memory that is actually available (see the **JVM Memory Used** in the last row in the **Copyright** tab). If Oxygen XML Editor does not start and you receive and error message saying that it could not start the JVM, decrease the **-Xmx** parameter and try again.

Increasing the Amount of Memory that Oxygen XML Editor Uses on macOS

To increase the memory available to Oxygen XML Editor on macOS:

1. Create a file named `vmoptions.txt`.
2. Add the **-Xmx** argument (or other Java VM arguments), one per line, and do not add extra new lines at the beginning or end of the file. For example:

```
-Xmx4g
-Dcom.oxygenxml.editor.plugins.dir="$OXYGEN_HOME/plugins"
```

3. Make sure you save the file as plain text (in the **TextEdit**, go to **Menu > Format > Make plain text**) and copy the file to the `Contents` folder for the main application launcher (i.e. `Oxygen XML Editor.app/Contents`). To show the `Contents` folder for the application launcher, right-click (or **Command+Single-Click**) the Oxygen XML Editor icon in **Finder**, and choose **Show Package Contents**.

Setting a System Property

Depending on the operating system and type of installer, you can set a Java system property in multiple ways:

- **[Windows/Linux Installer]** When installing the application on Windows or Linux using the provided installation kit, you can create your own custom startup parameters file *(on page 352)* in the installation folder.
- **[macOS Installer]** Create a file named `vmoptions.txt` in the `Contents` folder within the application installation folder, similarly to this procedure *(on page 349)*. Add each system property (or Java VM argument) on a separate line. For example:

  ```
  -DpropertyName1=value1
  -DpropertyName2=value2
  ```

- **[Windows Linux/Mac Startup Scripts]** The application also contains startup scripts in the installation folder. If you are using such scripts to start the application, you can follow this procedure to set system properties for them: Setting Parameters in the Command-Line Scripts *(on page 351)*.

Note:
You can also set a system property through a parameter prefixed with `-Doxy` in the command line used to start the application:

```
oxygen25.1.exe "-Doxyproperty.name=value"
```

but this system property will be set immediately after the application starts and might not be available if it is needed sooner.

To check the value for a system property, you can select **Help > About** from the main menu and look in the **System properties** tab.

To view the list of Oxygen XML Editor system properties, go to Custom System Properties *(on page 342)*.

Disabling DPI Scaling

Some users may prefer the look of smaller icons in an HiDPI display. To achieve this, display scaling needs to be disabled for high DPI settings. To disable the DPI scaling, set the following property *(on page 350)*:

```
sun.java2d.dpiaware=false
```

Setting Environment Variables

When started, the application inherits and can access all environment variables set in the operating system. All processes started by the application (for example, publishing using the DITA Open Toolkit engine or starting external tools) also inherit the environment variables provided to the application. Depending on the operating system, environment variables can be set in various ways:

- **[Windows]** (Note: You will need Administrator permissions or to work with a system administrator):
  1. Go to **Start > Edit the system environment variables > Environment Variables**.
  2. Click **New** in the **System variables** section.
  3. Specify the variable name and value in the **Name** and **Value** fields.
  4. Click **OK**.
  5. Restart Windows.
- **[Linux]**:
  1. Append the following line to the `/etc/environment` file:

     ```
     ENV_VAR_NAME=VALUE
     ```

  2. Reboot the computer.
- **[macOS]**: There is no standard way to set an environment variable so that it is inherited by the applications regardless of the way they start.

To check the value for an environmental variable, you can select **Help > About** from the main menu and look in the **System properties** tab.

Setting Parameters in the Command-Line Scripts

If you start Oxygen XML Editor with a command-line script (`oxygen.bat`/`oxygen.sh`), you have to add or modify parameters in the java command at the end of the script.

For example, to set the maximum amount of Java memory to 2 GB in **Windows**, add the **-Xmx** parameter to the last line of the `.bat` file like this:

```
%OXYGEN_JAVA% -Xmx2g -Dsun.java2d.noddraw=true ...
```

On **macOS**/**Linux**, add the **-Xmx** parameter (followed by a '\') to a new line just above the `ro.sync.exml.Oxygen\` line (at approximately line 100) in the `.bat` file like this:

```
-cp "$CP"\
 -Xmx2g\
 ro.sync.exml.Oxygen\
 ..
```

Creating Custom Startup Parameters File

You can create your own custom `.vmoptions` file and the application and the executable tools will automatically include your custom parameters at startup. The following custom files are recognized by the application and the executable tools:

- `custom_commons.vmoptions` - The parameters and their values of this file will be included in all the startup launchers.
- `custom_<app name>.vmoptions` - The *<app name>* is the name of the executable application or tool (for example, `custom_diffFiles.vmoptions` for the **Compare Files** tool). The parameters and their values of this file will be included in the startup launcher for this particular executable.

For example: To specify a different language for all launchers you can use the custom `vmoptions` file called `custom_commons.vmoptions` and the content would look like this:

```
-Dcom.oxygenxml.language=French
```

For example: To increase the memory available for a specific tool, such as the **Compare Files** tool (`diffFiles.exe`), you can use a custom `vmoptions` file called `custom_diffFiles.vmoptions` and the content would look like this:

```
-Xmx2g
```

To be recognized and included, these custom startup parameter files must be saved in the installation directory of Oxygen XML Editor.

How to Increase the Amount of Available Memory

Determining how to increase the amount of memory that is allocated to Oxygen XML Editor depends on how you launch the application.

- **Windows/Linux Application Launcher** - If you start Oxygen XML Editor using the default startup launcher that was created during a Windows or Linux installation, see Increasing the Amount of Memory that Oxygen XML Editor Uses on Windows and Linux *(on page 349)*.
- **macOS Application Launcher** - If you start Oxygen XML Editor using the default startup launcher that was created during a macOS installation, see Increasing the Amount of Memory that Oxygen XML Editor Uses on macOS *(on page 349)*.
- **Command-Line Script** - If you start Oxygen XML Editor using a command-line script, see Setting Parameters in the Command-Line Scripts *(on page 351)*.
- **Custom Startup Parameters File** - You can also create your own custom startup parameters file and increase the memory using this file. For more information, see Creating Custom Startup Parameters File *(on page 352)*.

5.

Perspectives

An Oxygen XML Editor *perspective (on page 3422)* is a layout geared towards a specific use. The Oxygen XML Editor interface uses standard interface conventions and components to provide a familiar and intuitive editing environment across all operating systems. There are several *perspectives* that you can use to work with documents in Oxygen XML Editor. You can change the *perspective* by selecting the respective icon () in the top-right corner of Oxygen XML Editor or by selecting the *perspective* from the **Window > Open Perspective** menu.

Editor Perspective

The **Editor** *perspective (on page 3422)* is the most commonly used *perspective* and it is the default *perspective* when you start Oxygen XML Editor for the first time. It is the *perspective* that you will use to edit the content of your XML documents.

To switch the focus to this *perspective*, select the  **Editor** button in the top-right corner of Oxygen XML Editor (or select **Editor** from the **Window > Open perspective** menu).

The layout of this *perspective* is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in Oxygen XML Editor. Most of the menus are common for all types of documents. However, Oxygen XML Editor also includes some context-sensitive and *framework (on page 3420)*-specific menus that are only available for a specific context or type of document.

Toolbars

Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Most of the toolbars are common for all types of documents. However, **Author** mode also includes *framework (on page 3420)*-specific toolbars, depending on the type of document that is being edited (for example, if you are editing a DITA document, a *DITA Author Custom Actions* toolbar is available that includes operations that are specific to DITA documents). The toolbars can be configured *(on page 374)* to suit your specific needs.

Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Views

Oxygen XML Editor includes a large variety of *dockable (on page 3418)* views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. The most commonly used views are displayed by default and you can choose to display others by selecting them from the **Window > Show View** menu. The layout of the views can also be configured *(on page 369)* according to your preferences.

When two or more views are displayed, the application provides divider bars. Divider bars can be dragged to a new position increasing the space occupied by one panel while decreasing it for the other.

As the majority of the work process centers around the Editor area, other views can be hidden using the toggle controls located on the top corner of the view ([on macOS]).

Some of the most helpful views in the **Editor** *perspective* include the following:

- **Project** view *(on page 413)* - Enables the definition of projects and logical management of the documents they contain.
- **DITA Maps Manager** view *(on page 3073)* - For DITA document types, this view helps you organize, manage, and edit DITA topics and maps.
- **Open/Find Resource** view *(on page 433)* - Designed to offer advanced search capabilities in various scopes.
- **Outline** view *(on page 549)* - It provides an XML tag overview and offers a variety of functions, such as modifications follow-up, document structure change, document tag selection, and elements filtering.
- **Results view** *(on page 558)* - Displays the messages generated as a result of user actions such as validations *(on page 784)*, transformation scenarios *(on page 1470)*, spell checking in multiple files *(on page 468)*, search operations, and others. Each message is a link to the location related to the event that triggered the message.
- **Attributes** view *(on page 552)* - Presents all possible attributes of the current element and allows you to edit attribute values. You can also use this view to insert attributes in **Text** mode. **Author** mode also includes an in-place attribute editor *(on page 640)*.
- **Model** view *(on page 555)* - Presents the currently edited element structure model and additional documentation as defined in the schema.
- **Elements view** *(on page 556)* - Presents a list of all defined elements that you can insert at the current cursor position according to the document's schema. In **Author** mode this view *(on page 643)* includes tabs that present additional information relative to the cursor location.
- **Entities** view *(on page 557)* - Displays a list with all entities declared in the current document as well as built-in ones.
- **Transformation Scenarios** view *(on page 1607)* - Displays a list with all currently configured transformation scenarios.

- **XPath/XQuery Builder** view *(on page 2120)* - Displays the results from running an XPath expression.
- **WSDL SOAP Analyzer** view *(on page 1085)* - Provides a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

Related information

Editing Supported Document Types *(on page 526)*
Editing Modes *(on page 362)*
Configuring the Layout of the Views and Editors *(on page 369)*

DITA Perspective

The DITA *perspective (on page 3422)* provides an editing environment with default side-views and other interface components that are optimal for working with DITA projects. To switch the focus to this *perspective*, select the  **DITA** button in the top-right corner of Oxygen XML Editor or select **DITA** from the **Window > Open perspective** menu. If you open a DITA resource from the **DITA Maps Manager** *(on page 3073)* while in another perspective, a message will appear asking if you want to switch to the **DITA** perspective.

The layout of this *perspective* is composed of the following components:

Menus

Most of the menus are common for all types of documents, but this perspective also include DITA-specific actions in the **DITA Maps** and **DITA** menus.

Toolbars

Many of the toolbar buttons are common for all types of documents, but **Author** mode also includes DITA-specific toolbar actions. The toolbars can be configured *(on page 374)* to suit your specific needs.

Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Views

Oxygen XML Editor includes a large variety of *dockable (on page 3418)* views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. By default, this perspective displays the most commonly used views for DITA users and you can choose to display others by selecting them from the **Window > Show View** menu. The layout of the views can also be configured *(on page 369)* according to your preferences.

Some of the most helpful views in the **DITA** *perspective* include the following:

- **DITA Maps Manager** view *(on page 3073)* - This view helps you organize, manage, and edit DITA maps.
- **DITA Reusable Components** view *(on page 3242)* - This view is helpful if you use a large amount of keys or reusable components in your DITA project. It collects all of the keys and reusable components that are defined in the *root map (on page 3424)* and presents them in several tabs. It includes various features to make it easy to locate and insert references to the reusable content.
- **DITA Referenced/Dependent Resources** view *(on page 3370)* - This view displays the references or dependencies for resources that are directly referenced in the DITA topic.
- **Project** view *(on page 413)* - Enables the definition of projects and logical management of the documents they contain.
- **Open/Find Resource** view *(on page 433)* - Designed to offer advanced search capabilities in various scopes.
- **Outline** view *(on page 549)* - It provides an XML tag overview and offers a variety of functions, such as modifications follow-up, document structure change, document tag selection, and elements filtering.
- **Results view** *(on page 558)* - Displays the messages generated as a result of user actions such as validations *(on page 784)*, transformation scenarios *(on page 1470)*, spell checking in multiple files *(on page 468)*, search operations, and others. Each message is a link to the location related to the event that triggered the message.
- **Attributes** view *(on page 552)* - Presents all possible attributes of the current element and allows you to edit attribute values. You can also use this view to insert attributes in **Text** mode. **Author** mode also includes an in-place attribute editor *(on page 640)*.
- **Elements view** *(on page 556)* - Presents a list of all defined elements that you can insert at the current cursor position according to the document's schema. In **Author** mode, this view *(on page 643)* includes tabs that present additional information relative to the cursor location.

XSLT Debugger Perspective

The **XSLT Debugger** *perspective (on page 3422)* allows you to detect problems in an XSLT transformation by executing the process step by step in a controlled environment. To switch the focus to this *perspective*, select the  **XSLT Debugger** button in the top-right corner of the interface or **Window > Open perspective > XSLT Debugger**.

The workspace in this *perspective* is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can split horizontally or vertically *(on page 265)* in a stack of XML editor panels and a stack of XSLT editor panels. The XML files and XSL files can be edited in **Text** mode *(on page 362)* only.

The layout of this *perspective* is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the **XSLT Debugger**.

Toolbars

Contains all actions needed to configure and control the debugging process. The toolbars can be configured *(on page 374)* to suit your specific needs.

XML Source Pane

The editing pane where you can display and edit data or document-oriented XML documents.

XSL Source Pane

The editing pane where you can display and edit XSL stylesheets.

Output View

Displays the transformed output that results from the input of a selected document (XML) and selected stylesheet (XSL) to the transformer. The result of transformation is dynamically written as the transformation is processed. There are three types of views for the output: a text view (with XML syntax highlight), an XHTML view, and one text view for each `<xsl:result-document>` element used in the stylesheet (if it is an XSLT 2.0 / 3.0 stylesheet).

Debugging Information Views *(on page 2223)*

Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This allows you to obtain a clear view of the transformation progress. See the Debugging Information Views *(on page 2223)* topic for a list of all the information views (and links to more details on each view).

Note:
You can add XPath expression automatically in the **XWatch** view using the **Watch expression** action from the contextual menu. In case you select an expression or a fragment of it and then click **Watch expression** in the contextual menu, the entire selection is presented in the **XWatch** view. Using **Watch expression** without selecting an expression displays the value of the attribute from the cursor position in the **XWatch** view. Variables detected at the cursor position are also displayed. Expressions displayed in the **XWatch** view are *normalized* (unnecessary white spaces are removed from the expression).

Debugging XSLT Stylesheets and XQuery Documents *(on page 2217)*

XQuery Debugger Perspective *(on page 358)*

XQuery Debugger Perspective

The **XQuery Debugger** *perspective (on page 3422)* allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this *perspective*, select the  **XQuery Debugger** button in the top-right corner of the interface or **Window > Open perspective > XQuery Debugger**.

The workspace in this *perspective* is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can split horizontally or vertically *(on page 265)* in a stack of XML editor panels and a stack of XQuery editor panels. The XML files and XQuery files can be edited in **Text** mode *(on page 362)* only.

The layout of this *perspective* is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the **XQuery Debugger**.

Toolbars

Contains all actions needed to configure and control the debugging process. The toolbars can be configured *(on page 374)* to suit your specific needs.

XML Source Pane

The editing pane where you can display and edit data or document-oriented XML documents.

XQuery Source Pane

The editing pane where you can display and edit XQuery files.

Output View

Displays the transformed output that results from the input of a selected document (XML) and selected XQuery document to the XQuery transformer. The result of transformation is dynamically written as the transformation is processed. There are two types of views for the output: a text view (with XML syntax highlight) and an XHTML view.

Debugging Information Views *(on page 2223)*

Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This allows you to obtain a clear view of the transformation progress. See the Debugging Information Views *(on page 2223)* topic for a list of all the information views (and links to more details on each view).

Note:
You can add XPath expression automatically in the **XWatch** view using the **Watch expression** action from the contextual menu. If you select an expression, or a fragment of it, and then click **Watch expression** in the contextual menu, the entire selection is presented in the **XWatch** view. Expressions displayed in the **XWatch** view are normalized (unnecessary white spaces are removed from the expression).

Debugging XSLT Stylesheets and XQuery Documents *(on page 2217)*
XSLT Debugger Perspective *(on page 356)*

Database Perspective

The **Database** *perspective (on page 3422)* allows you to manage databases. To switch the focus to this *perspective*, select the  **Database** button in the top-right corner of Oxygen XML Editor or **Window > Open perspective > Database** from the **Window > Open perspective** menu.

The **Database** *perspective* offers various helpful features, including:

- Support for browsing multiple connections at the same time.
- Support for both *Relational* and *Native XML* databases.
- Browsing the structure of databases.
- Viewing tables from databases.
- Inspecting or modifying data.
- Specifying XML Schemas for XML fields.
- SQL execution.
- XQuery execution.
- Data export to XML.

Supported Databases

Oxygen XML Editor supports numerous types of databases, including:

- eXist XML Database
- IBM DB2 (Enterprise edition only)
- JDBC-ODBC Bridge
- MarkLogic (Enterprise edition only)

- MySQL
- Oracle 11g (Enterprise edition only)
- PostgreSQL (Enterprise edition only)
- SharePoint (CMS)
- Microsoft SQL Server 2005 and Microsoft SQL Server 2008 (Enterprise edition only) **(Deprecated)**

Note:
For the databases marked with "Enterprise edition only", the XML capabilities are only available in the Enterprise edition of Oxygen XML Editor. For a detailed feature matrix that compares the Academic, Professional, and Enterprise editions of Oxygen XML Editor go to the Oxygen XML Editor website.

Supported Capabilities

The supported non-XML capabilities are as follows:

- Browsing the structure of the database instance.
- Opening a database table in the **Table Explorer** view *(on page 2135)*.
- Handling the values from **XML Type** columns as String values.

Note:
The non-XML capabilities are available in the Enterprise, Academic, and Professional editions of Oxygen XML Editor by registering the database driver as a *Generic JDBC* type driver when defining the data source for accessing the database. For more information, see Database Connection Support *(on page 2138)*.

The supported XML capabilities are as follows:

- Displaying an XML Schema node in the tree of the database structure (for databases with an XML-specific structure) with actions for opening, editing, and validating the schemas in an Oxygen XML Editor editor panel.
- Handling the values from **XML Type** columns as XML instance documents that can be opened and edited in an Oxygen XML Editor editor panel.
- Validating an XML instance document added to an XML Type (column of a table, etc.)

Tip:
Connections configured on relational data sources can be used to import data to XML or to generate XML schemas.

Layout of the Database Perspective

The layout of this *perspective* is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the perspective.

Toolbars

Contains all actions needed to configure and control the debugging process. The toolbars can be configured *(on page 374)* to suit your specific needs.

Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Data Source Explorer View *(on page 2133)*

Provides browsing support for the configured connections.

Table Explorer View *(on page 2135)*

Provides table content editing support for inserting new rows, deleting table rows, editing cell values, exporting to an XML file, and more.

Related information

Working with Databases *(on page 2133)*
Data Source Explorer View *(on page 2133)*
Table Explorer View *(on page 2135)*

6.

Editing Modes

The main editing area in Oxygen XML Editor includes several editing modes to suit the type of editing that you want to perform. You can easily switch between modes by clicking on the desired mode at the bottom of the main editing pane. Oxygen XML Editor offers the following editing modes:

- **Text** *(on page 362)* - This mode presents the source of the document.
- **Grid** *(on page 363)* - This mode displays the document as a structured grid of nested tables.
- **Author** *(on page 363)* - This mode enables you to edit in a WYSIWYG-like editor.
- **Design** *(on page 364)* - This mode is found in the schema editor and represents the schema as a diagram.

The default editing mode that will be initially opened for each type of document can be set in two ways:

- If the **Allow Document Type specific edit mode setting to override the general mode setting** option *(on page 178)* is selected in the **Edit Modes** preferences page, then the edit mode specified in the **Document Type** configuration dialog box *(on page 147)* is used when that particular type of document is initially opened.
- If the **Allow Document Type specific edit mode setting to override the general mode setting** option *(on page 178)* is not selected, then the edit mode specified in the table in the **Edit Modes** preferences page *(on page 178)* is used when that particular type of document is initially opened.

Text Editing Mode

The **Text** mode editor in Oxygen XML Editor is designed to be a simple, yet powerful, XML source editor. It provides support to help you edit, transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Editor also includes specialized editing actions, a powerful *Content Completion Assistant*, and many other unique features.

To switch to this mode, select **Text** at the bottom of the editing area. 

For more information about working with XML documents in **Text** mode and all of the details about its features, see the **Editing XML Documents in Text Mode** section *(on page 527)*.

Related information

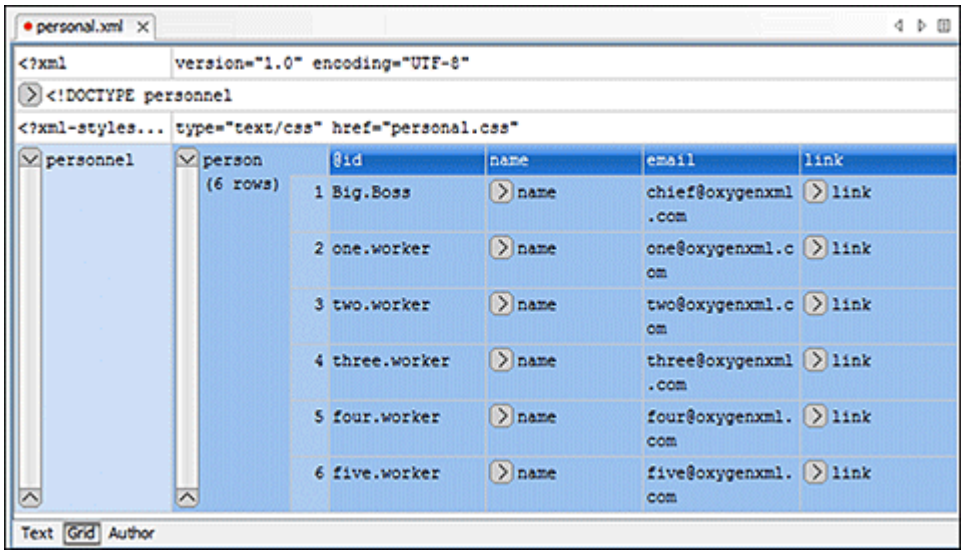
Editing XML Documents in Text Mode *(on page 527)*

Grid Editing Mode

The Oxygen XML Editor **Grid** editing mode displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup. You can easily expand or collapse elements within the table and the document structure can be changed with simple drag/drop or copy/paste operations.

To switch to this mode, select **Grid** at the bottom of the editing area. 

Figure 53. Grid Editing Mode



For more information about working with XML documents in **Grid** mode and all of the details about its features, see the **Editing XML Documents in Grid Mode** section *(on page 589)*.

Related information

Editing XML Documents in Grid Mode *(on page 589)*

Author Editing Mode

The **Author** editing mode in Oxygen XML Editor allows you to visually edit XML documents in a user-friendly interface that is similar to a WYSIWYG word processor. Oxygen XML Editor provides support for visually editing the most commonly used XML vocabularies in **Author** mode, including DITA, DocBook, TEI, and XHTML. Adding text content is as simple as doing so in a standard text editor but the content is rendered similar to how you will see it in the output. Tables, images, and media objects (such as videos) are also rendered comparable to the output.

To switch to this mode, click the **Author** button at the bottom of the editing area. 

For more information about working with XML documents in **Author** mode and all of the details about its features, see the **Editing XML Documents in Author Mode** section *(on page 598)*.

Related information

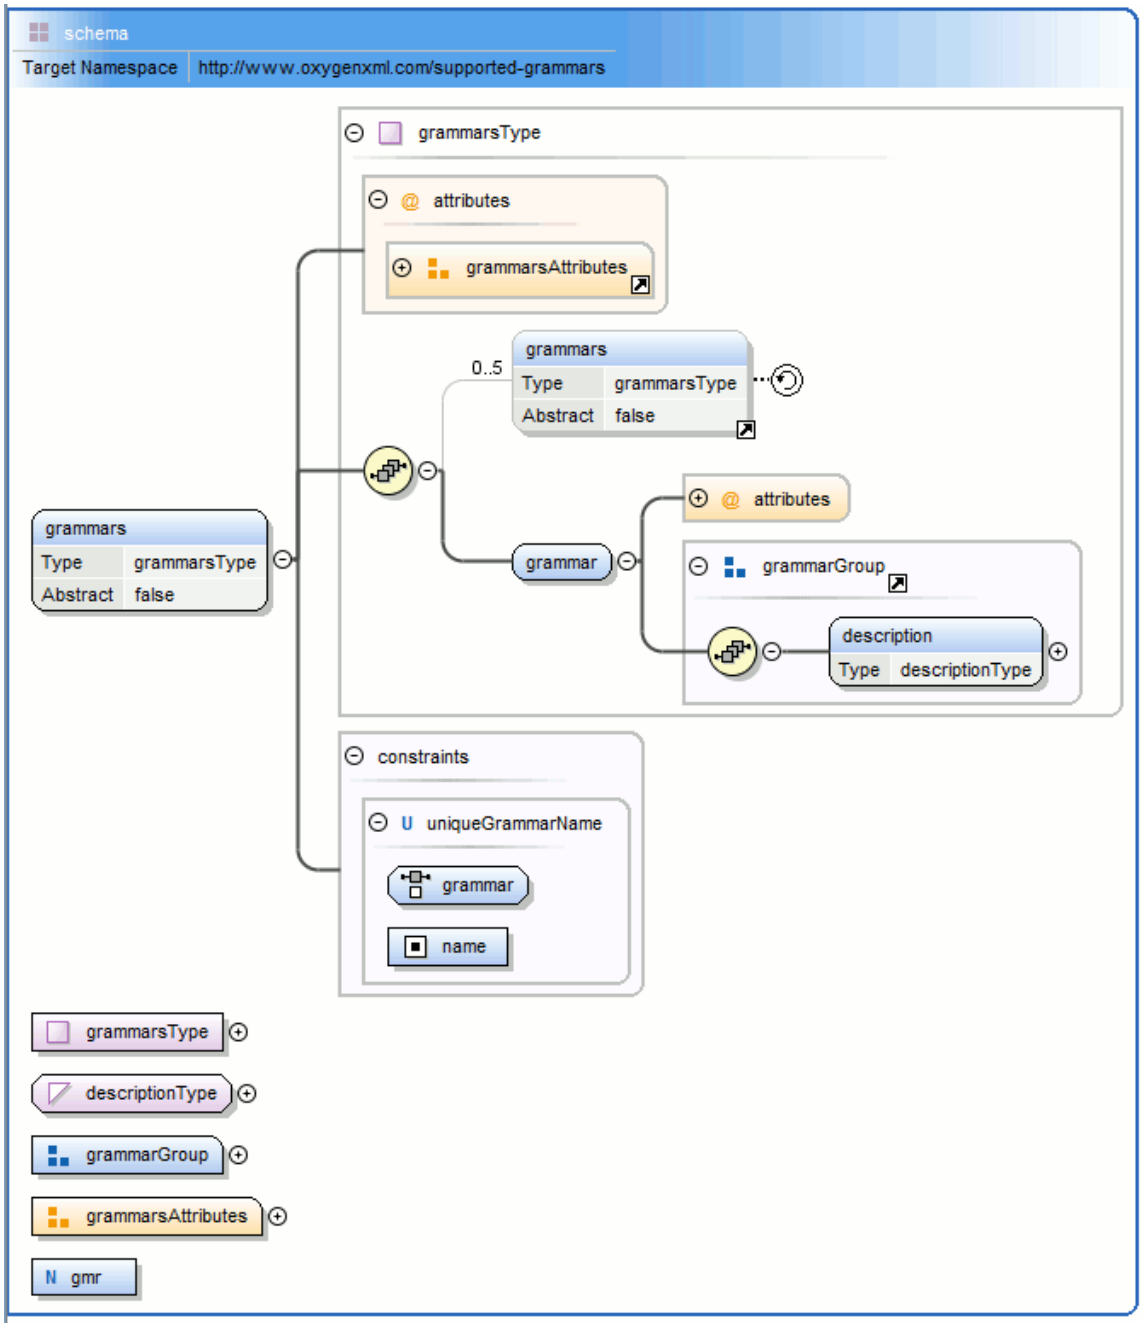
Editing XML Documents in Author Mode *(on page 598)*

Design Editing Mode (Schema Diagram Editor)

Schemas allow document designers to specify the allowed structure and content of a document and to check if it is valid. Oxygen XML Editor provides a simple and expressive schema diagram editor (**Design** mode) for editing XML schemas or JSON schemas. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

The **Design** mode offers a diagram view of the schema document by rendering all the schema components. You can edit component features directly within the diagram (for instance, the component name, its type, etc.), you can quickly navigate to the referenced definitions (elements, attributes, types, groups, etc.), and you can use drag-and-drop operations to move, copy, or make references. It also features some specialized helper views (such as the **Palette** view and **Facets** view) to further enhance the diagram editor, various contextual menu actions, validation support, and much more.

To switch to this mode, select **Design** at the bottom of the editing area. 
Figure 54. XML Schema Diagram



XML Schema Resources

For more information about designing and editing XML schemas, and all the details about the features that are available in the Oxygen XML Editor **Design** mode for XML schema documents, see the **Editing XML Schemas** section *(on page 960)* and the **XML Schema Design Mode (XML Schema Diagram Editor)** subsection *(on page 961)*.

JSON Schema Resources

For more information about designing and editing JSON schemas, and all the details about the features that are available in the Oxygen XML Editor **Design** mode for JSON schema documents, see the **Editing JSON**

Schemas section *(on page 1164)* and the **JSON Schema Design Mode (JSON Schema Diagram Editor)** subsection *(on page 1166)*.

7.

Working With Documents

Oxygen XML Editor includes a variety of general features that can be used when working with most types of documents. More specialized features are available when working with specific types of documents, such as the various types of XML documents, CSS *(on page 1089)*, JavaScript *(on page 1219)*, Markdown *(on page 1296)*, and more. For details about those specialized features for specific types of documents, see Editing Supported Document Types *(on page 526)*.

This chapter includes information about how to create and work with documents, working with projects, and various general editing features. This chapter also includes information about some of the special tools that are included in Oxygen XML Editor, such as the file and directory comparison tools *(on page 483)*.

Getting Familiar with the Interface

Oxygen XML Editor includes several *perspectives (on page 3422)* and editing modes *(on page 362)* to help you accomplish a wide range of tasks. Each *perspective* and editing mode also includes a large variety of helper views, menu actions, toolbars, and contextual menu functions.

There are various ways that you can configure the layout of the views or editors *(on page 369)*, and you can customize the toolbars *(on page 374)*.

Regardless of the *perspective (on page 3422)* or editing mode that you are working with, the default layout consists of the following areas:

Menus

Menu-driven access to all the features and functions available in Oxygen XML Editor. Most of the menus are common for all types of documents, but Oxygen XML Editor also includes some context-sensitive and *framework*-specific menus and actions that are only available for a specific context or type of document.

Toolbars

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all *perspectives*, editing modes, and types of documents, while others are specific to the particular *perspective* or mode. Some toolbars are also *framework*-specific, depending on the type of document that is being edited. All the toolbars can be configured *(on page 374)* to suit your specific needs.

Helper Views

Oxygen XML Editor includes a large variety of *dockable (on page 3418)* views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most

commonly used views for each *perspective* and editing mode are displayed by default and you can choose to display others to suit your specific needs. The layout of the views can also be configured *(on page 369)* according to your preferences.

Editor Pane

The main editing area in the center of the application. Each editing mode provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each editing mode also includes various contextual menu actions and other features to help streamline your editing tasks. Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them *(on page 403)*.

Perspectives

Oxygen XML Editor includes several different *perspectives (on page 353)* that you can use to work with your documents. The **Editor** *perspective* is the most commonly used *perspective* used for displaying and editing the content of your XML documents, and it is the default *perspective* when you start Oxygen XML Editor for the first time. Oxygen XML Editor also includes a **Database** *perspective* that allows you to manage databases and their connections and a few debugging *perspectives* that allow you to detect problems in XSLT or XQuery transformations.

Status Bar

The status bar at the bottom of the application contains some useful information when you are working with documents. It includes the following information, in the order it is displayed from left to right:

- The path of the current document.
- The *Unicode* value *(on page 473)* for the character directly to the right of the current cursor position.
- The status of the current document. The status of **Modified** is displayed for documents that have not yet been saved. Otherwise, this section is left blank.
- In **Text** editing mode, the current line and character position is displayed.
- If the **Check for notifications** option *(on page 133)* is selected, this section will show you when new messages have been received. The types of messages include the addition of new videos on the Oxygen XML Editor website, the announcement of upcoming webinars and conferences where the Oxygen XML Editor team will participate, and more.
- The memory consumption, including the memory used by the application and the maximum amount that is allocated to the application.
- If the **Show memory status** option *(on page 135)* is selected, a  **Free unused memory** icon is displayed in the bottom-right corner and you can use this icon to free up unused memory.

Configuring the Layout of the Views and Editors

All of the side-views available in Oxygen XML Editor are *dockable (on page 3418)* and there are various ways to configure and arrange the layout of the views and editing panes. You can also configure the layout of the toolbars *(on page 374)*.

To open a view, select it from the **Window > Show View** menu. You can hide a view by closing it with the ✕ button at the top-right corner of the view, or with the **Window > Hide current view** action.

Arranging the Layout

You can drag any view to any margin of another view or editor inside the Oxygen XML Editor window. Once you create a layout that suits your needs, you can save it from **Window > Export Layout**. Oxygen XML Editor creates a layout file containing the preferences of the saved layout. To load a layout, go to **Window > Load Layout**. To reset it, select **Window > Reset Layout**.

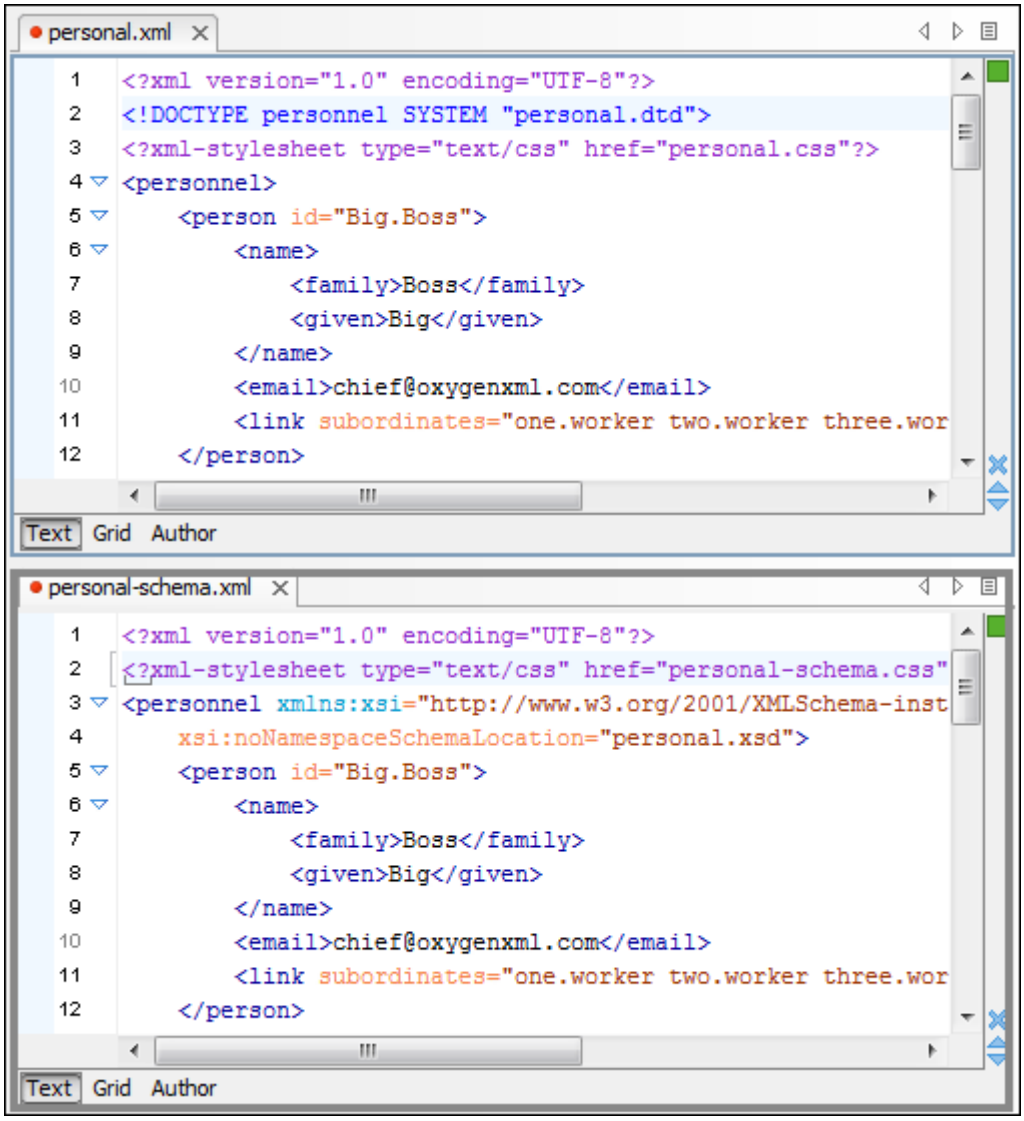
Note:
The **Load Layout** menu lets you select between the default layout, a predefined layout, or a custom layout. The changes you make using the **Load Layout** menu are also reflected in the **Application Layout** preferences page.

The changes you make to any layout are preserved between working sessions. The predefined layout files are saved in the preferences directory *(on page 132)* of Oxygen XML Editor.

You can drag the editors and arrange them in any order, both horizontally and vertically.

The following image presents two editors arranged as horizontal tiles. To arrange them vertically, drag one of them on top of the other. In the following example, the `personal.xml` file was dragged over the `personal-schema.xml` file:

Figure 55. Drag and Drop Editors



Hide or Float Views

Hide

To gain more editing space in the Oxygen XML Editor window, click **Toggle auto-hide** in any view. This button sets the view in the *auto-hide* state, making it visible only as a vertical tab, at the margins of the Oxygen XML Editor window. To display a view in the *auto-hide* state, hover its side-tab with your cursor, or click it to keep the view visible until you click elsewhere.

Float

A view can also be set to a floating state by using the **Toggle floating** action, making it independent from the rest of the Oxygen XML Editor window.

Maximize the Editing Environment

You can configure the interface to maximize the editing area, leaving more vertical screen space available for the main editing pane. This is, for example, useful for presentations on low-resolution screens or for laptops

with small screen space. You can use the following two actions that are available in the **Window** menu to create a near full-screen editing environment:

Maximize Editor Area

If toggled on, all side views are minimized to give you more horizontal space in the editing pane.

Hide All Toolbars

If toggled on, all toolbar buttons are hidden to give you more vertical space in the interface.

Tile/Stack Editor Actions

You can also tile or stack all open editors using the following actions from the toolbar or **Window** menu:

Tile Editors Horizontally

Splits the editing area into horizontal tiles, one for each open file.

Tile Editors Vertically

Splits the editing area into vertical tiles, one for each open file.

Stack Editors

The reverse of the **Tile Editors Horizontally/Vertically** actions. Stacks all open editors.

Synchronous Scrolling

Select this action to scroll through the tiled editors at the same time.

Note:
When tiled, you can still drag and drop the editors, but note that they are docked in the same way as a window/view (instead of just tabs). You are actually rearranging the editor windows, so drag the editor tab and drop it to one of the sides of an editor (left/right/top/bottom). While dragging, you will see the dark gray rectangle aligned to one of the sides of the editor, or around the entire editor window. If you drop it to one of the sides, it will dock to that side of the editor. If you drop it when the rectangle is around the entire window of the editor, it will get stacked on top of that editor. You can also grab one of the stacked editors and tile it to one of the sides.

Split Editor Actions

You can divide the editing area vertically and horizontally using the following actions available in the toolbar and **Window** menu:

- **Split Editor Horizontally** - Splits the editor horizontally so that two editor panes are displayed with one on top of the other. This is useful for comparing and merging content between two documents.
- **Split Editor Vertically** - Splits the editor vertically so that two editor panes are displayed side by side. This is useful for comparing and merging content between two documents.
- **Unsplit Editor** - Removes a split action on the editing area.

To maximize or restore the editors, go to **Window > Maximize Editing Area**.

Switch, Move, or Hide Editor Tabs

Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them, and you can even hide the tabs to only show the currently open file.

Note:
If multiple file tabs are left open when you close the application, upon startup, Oxygen XML Editor will not load the file content until you switch to the corresponding file tab. The tabs remain visible as a placeholders until the focus is switched to them. This helps to improve the application's startup time. If you want to disable this feature (meaning that the previously open files will all be re-loaded at startup), deselect the **Load file content only when switching to its corresponding editor tab** option in the **Global** preferences page *(on page 134)*.

Switching Editor Tabs

You can switch between editor tabs by using any of the following methods:

Mouse and Scroll Wheel

Of course, you can switch to a different editor tab by left-clicking the tab with your mouse, but when there are too many open tabs to fit on the screen, you can hover over the tab stripe and use the scroll wheel on your mouse to scroll to the left or right (same as using the two arrows on the far-right of the tab stripe).

Buttons on the Far-Right of the Tab Stripe (◀ ▶ ☰)

You can use the arrow buttons (◀ ▶) on the right side of the tab stripe to scroll to the left or right and the ☰ **Show List** button opens a pop-up window that displays all the open file tabs and allows you to select and switch to a specific open file.

Ctrl + Tab (Command + Tab on macOS) [NOTE: Ctrl + Page Down (Ctrl + Option + Right Arrow on macOS) does the same]

Switches to the next open tab in the order specified in the **Order of switching between editor tabs** option *(on page 135)*.

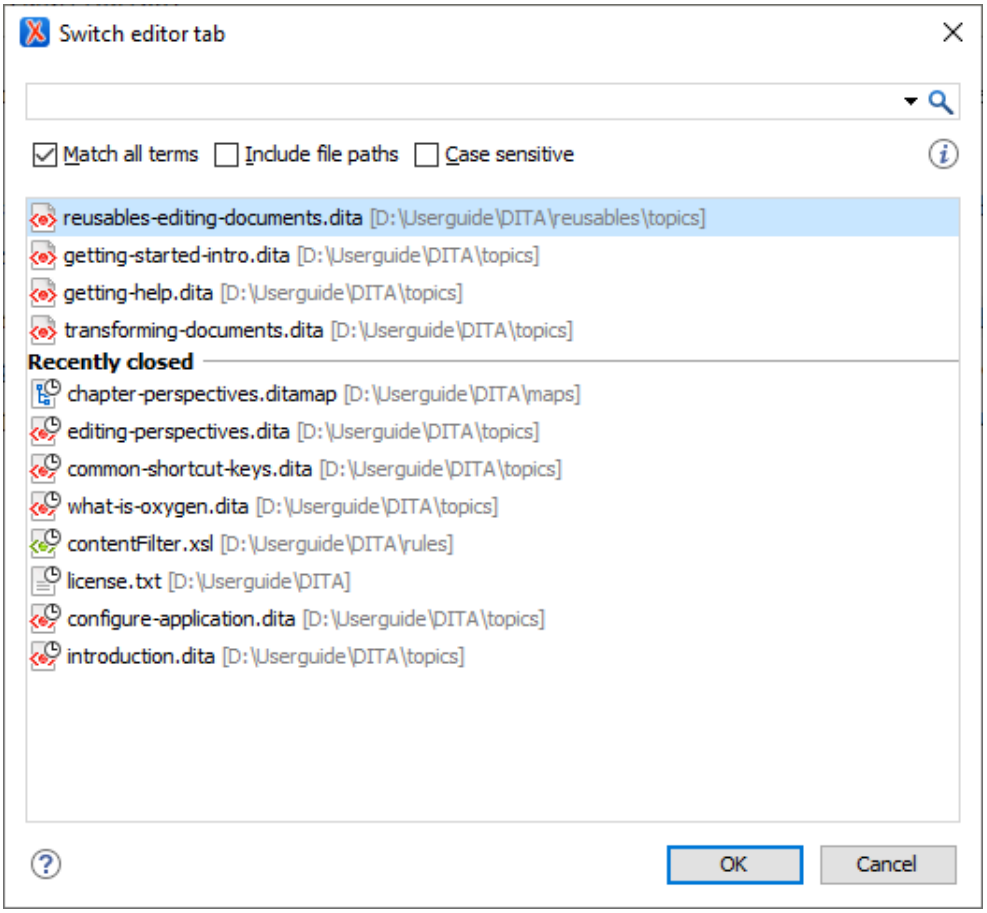
Ctrl + Shift + Tab (Command + Shift + Tab on macOS) [NOTE: Ctrl + Page Up (Ctrl + Option + Left Arrow on macOS) does the same]

Switches to the previous open tab in the order specified in the **Order of switching between editor tabs** option *(on page 135)*.

Window > Switch editor tab (Ctrl + F9 (Command + F9 on macOS))

This action opens a dialog box that allows you to switch to a particular editor tab by selecting it from a filterable list. This is especially helpful when you have a large amount of open file tabs and you want to switch to a certain tab this is not shown on the screen. It includes a search filter field and several options to help you find specific open file tabs.

Figure 56. Switch Editor Tab Dialog Box



The **Switch Editor Tab** dialog box contains the following options and features:

Search Filter

You can enter text in the filter field at the top of the dialog box to filter the list and search for specific open files. You can enter any number of terms, separated by space, and wildcards are allowed (for example, `*` to match any sequence of characters, or `?` to match a single character). This field also has a history drop-down that allows you to select previously used search terms.

Match all terms

If this option is selected, only the files that match all of your search terms will be displayed. If you use a wildcard in the search filter, this option is automatically disabled.

Include file paths

If this option is selected, the search is expanded to include file paths, and also the paths are displayed in this dialog box.

Case sensitive

If this option is selected, the search operation will be case-sensitive.

List of Open File Tabs

All files that are currently open are displayed in the upper part of the main pane of the dialog box, followed by recently closed files. Files that have been modified but not yet saved are prefixed by an asterisk. To switch to a particular file tab, double-click the file or select it and click **OK**.

Moving Editor Tabs

You can move editor tabs by using any of the following methods:

Mouse Drag

You can use your mouse to drag editor tabs to a new location on the tab stripe.

Ctrl + Alt + Comma

Moves the current file tab one position to the left.

Ctrl + Alt + Period

Moves the current file tab one position to the right.

Hiding Editor Tabs

If you want to hide all the file tabs and only show the currently open file, select **Hide editor tabs** from the **Window** menu. This does not close the other tabs, just hides them. You can still navigate between tabs using keyboard shortcuts (**Ctrl + Tab**, **Ctrl + Shift + Tab**, **Ctrl + F6**, **Ctrl + Shift + F6**) or by selecting **Next editor** or **Previous editor** from the **Window** menu.

Resources

For more information about configuring the interface of Oxygen XML Editor, watch our video demonstration:

https://www.youtube.com/embed/anwjepfAdEk

Tip:
To get more ideas for more advanced customization possibilities, watch our Webinar: **Working with DITA in Oxygen - Customizing the Editing Experience**. It offers a visual demonstration of how to customize actions, document validation, content completion, new document templates, **Author** mode rendering, and more.

Related information
Configuring Toolbars *(on page 374)*

Configuring Toolbars

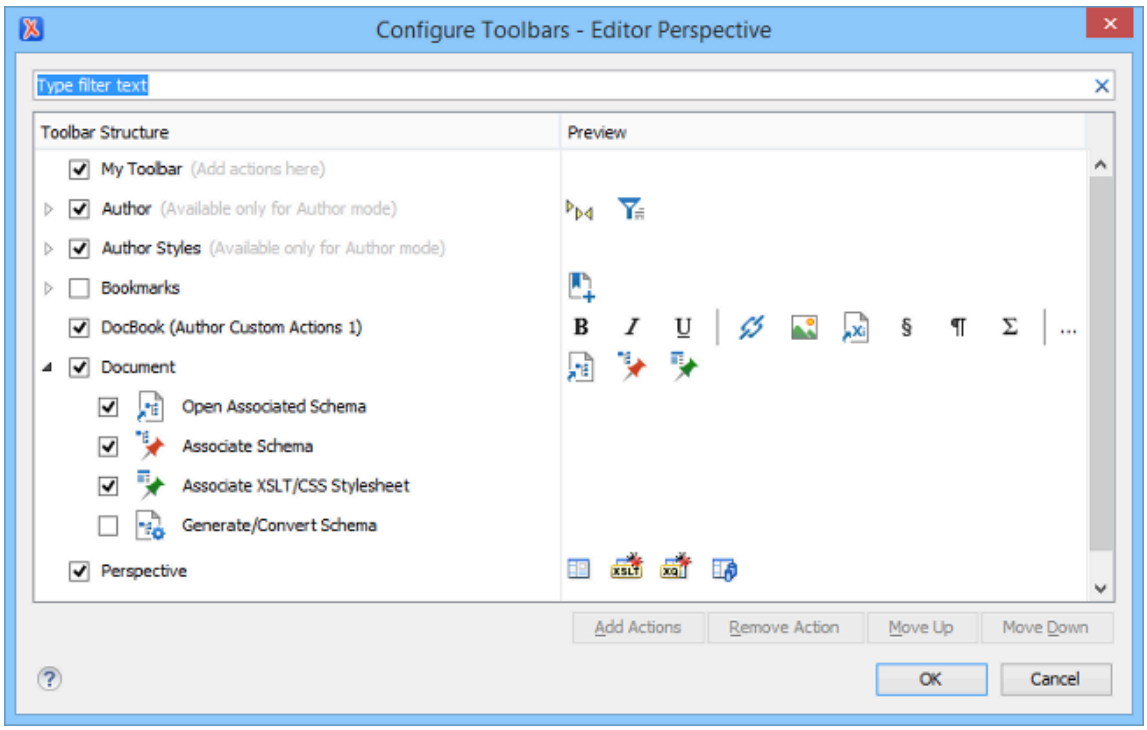
You can configure the toolbars in Oxygen XML Editor to personalize the interface for your specific needs. You can choose which toolbars to show or hide in the current editor mode (**Text**, **Author**,**Design**, or **Grid**) and in the current *perspective (on page 3422)* (**Editor**, **XSLT Debugger**, **XQuery Debugger**, or **Databse**). You can

also choose which actions to display in each toolbar, add actions to toolbars, and customize the layout of the toolbars.

To configure the toolbars, open the **Configure Toolbars** dialog box by doing one of the following:

- Right-click any toolbar and select **Configure Toolbars**.
- Select **Configure Toolbars** from the **Window** menu.

Figure 57. Configure Toolbars Dialog Box



The **Configure Toolbars** dialog box provides the following features:

Filter Text Box

You can use the filter text box at the top of the dialog box to search for a specific toolbar or action.

Show or Hide Toolbars

You can choose whether to show or hide a toolbar by using the checkbox next to the toolbar name. This checkbox is only available for toolbars that are available for the current *perspective (on page 3422)* and editing mode.

Show or Hide Actions in a Toolbar

To show or hide actions in a toolbar, expand it by clicking the arrow next to the toolbar name, then use the checkbox to select or deselect the appropriate actions. The toolbar configuration changes in the **Preview** column according to your changes.

Add Actions to a Toolbar

Use the **Add Actions** button to open the **Add Actions** dialog box that displays all the actions that can be added to any of the toolbars, with the exception of those that are contributed from *frameworks (on page 3420)* or 3rd party *plugins (on page 3422)*.

Remove Actions from a Toolbar

You can remove actions that you have previously added to toolbars by using the **Remove Action** button.

Move Actions in a Toolbar

Use the **Move Up** and **Move Down** actions to change the order of the actions in a toolbar.

The **Configure Toolbars** dialog box also provides a variety of other ways to customize the layout in Oxygen XML Editor.

Customize My Toolbar

You can customize the **My Toolbar** to include your most commonly used actions. By default, this toolbar is listed first. Also, it is hidden until you add actions to it and you can easily hide it with the **Hide "My Toolbar" Toolbar** action that is available when you right-click anywhere in the toolbar area.

Drop-down Menu Actions

Composite actions that are usually displayed as a drop-down menu can only be selected in one toolbar at a time. These actions are displayed in the **Configure Toolbars** dialog box with the name in brackets.

Configure External Tools Action

There is a **Configure external tools** composite action that appears in the toolbar called **Tools**. It is a drop-down menu that contains any external tools that are configured in the **External Tools** preferences page.

Note:
If no external tools are configured, this drop-down menu is not shown in the toolbar.

Additional actions are available from the **Window** menu or contextual menu when invoked from a toolbar that allows you to further customize your layout. These actions include:

Reset Toolbars

To reset the layout of toolbars to the default setting, select the **Reset Toolbars** action from the contextual menu or **Window** menu.

Reset Layout

To reset the entire layout (including toolbars, editing modes, views, etc.) to the default setting, select **Reset Layout** from the contextual menu or **Window** menu.

Export Layout

You can use the **Export Layout** action that is available in the **Window** menu to export the entire layout of the application to share it with other users.

Hide Toolbars

You can use the **Hide Toolbar** action from the contextual menu to easily hide a displayed toolbar. When you right-click a toolbar it will be highlighted to show you which actions are included in that toolbar.

Related information

Configuring the Layout of the Views and Editors *(on page 369)*

Creating, Opening, Saving, and Closing Documents

Oxygen XML Editor includes various features, actions, and wizards to assist you with creating new files and working with existing files. This section explains many of these features, including information on creating new documents, opening, saving, and closing existing files, searching documents, viewing file properties, and more.

Creating New Documents and Templates

Oxygen XML Editor includes a helpful **New Document** wizard that allows you to customize and create new files from a large list of document types and built-in templates. You can also create your own templates *(on page 385)* and share them with others *(on page 391)*.

To create a new document:

1. Click the **New** button on the toolbar or select **File > New**.
2. Select the type of document that you want to create.

   Tip:
   You can use the text filter field at the top of the dialog box to search for a specific template.

3. Click the **Create** button at the bottom of the dialog box.

New Document Wizard

Oxygen XML Editor supports a wide range of document types. The **New Document** wizard presents the default associations between a file extension and the type of editor that opens the file. To customize these default associations, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **File Types** *(on page 306)*.

The **New Document** wizard creates a skeleton document that may contain a root element, the document prolog, and possibly other child elements depending on options that are specific for each schema type. You can also create your own custom document templates *(on page 385)* and select them from this wizard.

New Document Wizard

To create a new document using this wizard, follow these steps:

1. Click the **New** button on the toolbar or select **File > New**.

   Result: The **New Document** wizard is displayed:

   Figure 58. New Document Wizard

   
   The first page of the wizard displays the supported document types and groups them in the following categories:

   Recently Used

   Contains the list of the most recently used file types. To clear the history of this folder, right-click an entry and select **Remove all** (or select an entry and press **Ctrl + Delete** on your keyboard). To remove a single entry, right-click and select **Remove** (or select the entry and press **Delete** on your keyboard).

   User-defined template directory

   You can add your own custom templates by creating template files *(on page 385)* in a directory and then adding that directory to the list of template directories that Oxygen XML Editor uses in the **Document Templates** preferences page *(on page 174)*. This user-defined directory will also appear in the **New Document** wizard.

   Popular

Contains a list of popular framework templates. Each of these templates are marked as popular using a properties file that contains `popular` as one of the values for the `tags` property. For example, for the `OXYGEN_INSTALL_DIR/frameworks/dita/templates/topic/Topic.dita` template, there is a `Topic.properties` sibling file that contains `tags=popular`. Other document templates can also be added to the **Popular** category by customizing them using a properties file for each one *(on page 387)*.

New Document

Contains the list of all supported document types. This list includes XML, XSL, XML Schema, Document Type Definition, Relax NG Schema, XQuery, Web Services Definition Language, Schematron Schema, CSS, Text, PHP, PowerShell, JavaScript, Java, C, C++, Batch, Shell, Properties, SQL, *XML Catalog*, PERL, JSON, and more.

Global Templates

Contains the list of built-in templates along with user-defined custom templates. You can create your own custom document templates *(on page 385)* and add them to the `templates` folder of the Oxygen XML Editor installation directory.

Framework Templates

Contains the list of templates defined in the **Document Type** configuration dialog box (**Templates** tab) *(on page 170)* for each *framework*.

2. Select the type of document that you want to create.

Tip:
You can use the text filter field at the top of the dialog box to search for a specific template.

3. If you want to change the default name and path of the file, select the **Save as** option and specify the file path (the **Show "Save as" option to save newly created documents in the "New" document wizard** option *(on page 209)* must be selected in the **Save** preferences page). Otherwise, the file will be opened in a new tab with a default *untitled* name and the document path will not exist until you save it.

Note:
For DITA documents, the dialog box includes some additional options for generating a title, file name, and root ID attribute. For more information, see Creating a New DITA Topic *(on page 3138)*.

4. If you want to use the default settings in the creation process, select **Create** at the bottom of the dialog box.

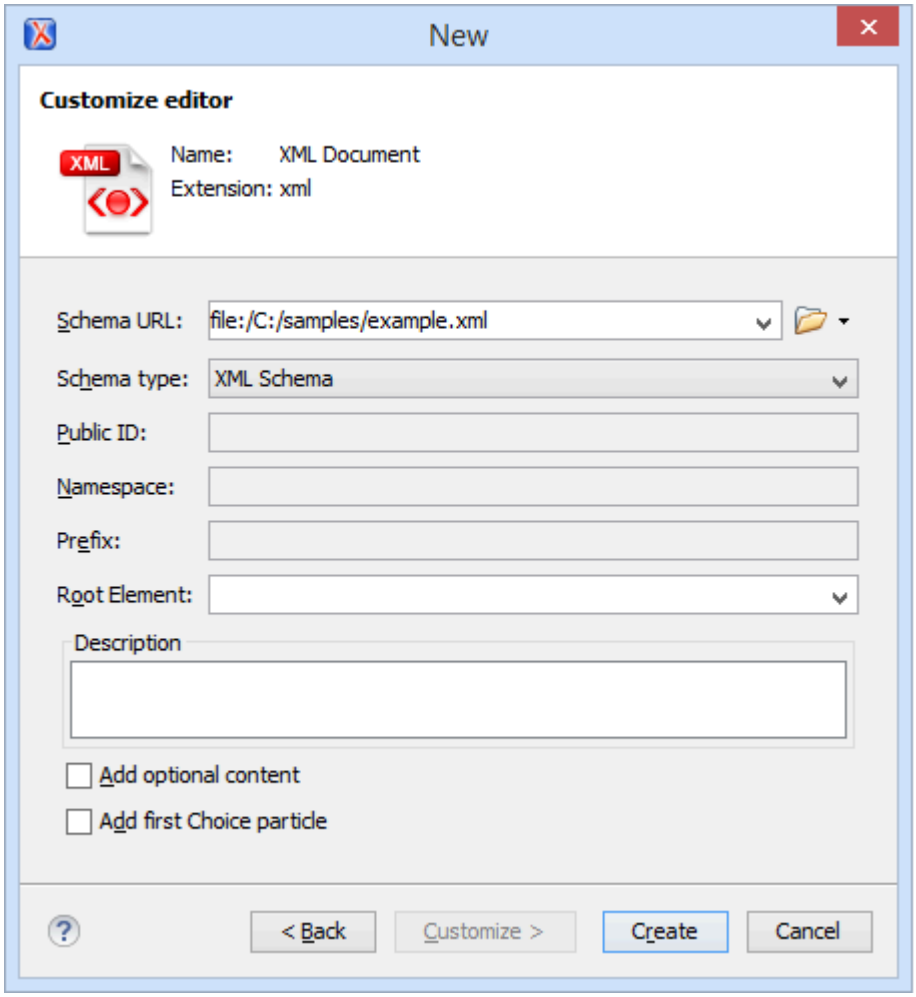
Result: The document is created using the default settings and the new file is opened in the appropriate editor.

5. If you want to configure properties before creating the file, select **Customize**. This action is available for XML, XML Schema, Schematron, and XSL documents.

   Result: A new file configuration dialog box is opened that allows you to customize various options, depending on the document type you selected. After configuring the options in this wizard, click **Create** to create the file and open it in the appropriate editor.

XML Document Configuration Page

Figure 59. New XML Document Configuration Wizard Page



If you selected **XML Document** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

Schema URL

Specifies the path to the schema file. When you select a file, Oxygen XML Editor analyzes its content and tries to fill in the rest of the dialog box.

Schema Type

Allows you to select the schema type. The following options are available: `XML Schema`, `DTD`, `RelaxNG XML syntax`, `RelaxNG compact syntax`, and `NVDL`.

Public ID

Specifies the PUBLIC identifier declared in the document prolog.

Namespace

Specifies the document namespace.

Prefix

Specifies the prefix for the namespace of the document root.

Root Element

Populated with elements defined in the specified schema, enables selection of the element used as document root.

Description

A small description of the selected document root.

Add Optional Content

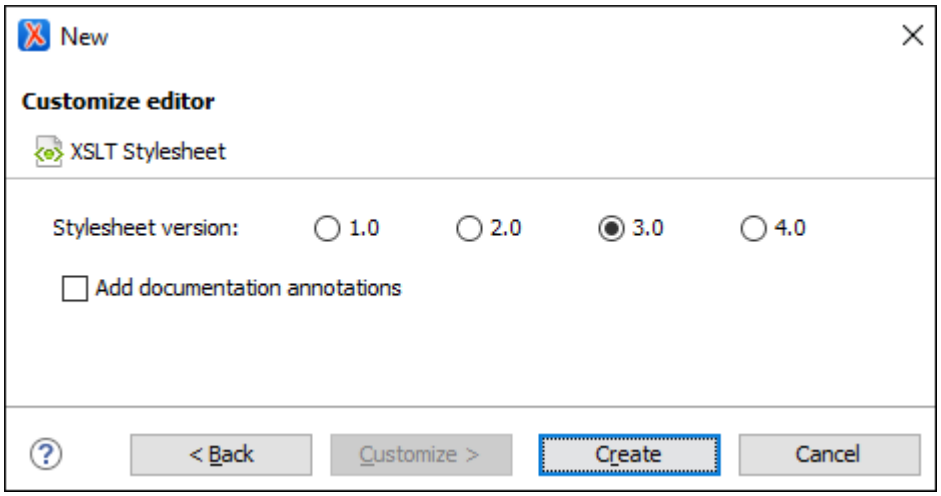
If you select this option, the elements and attributes defined in the XML Schema as optional are generated in the skeleton XML document.

Add First Choice Particle

If you select this option, Oxygen XML Editor generates the first element of an `<xs:choice>` schema element in the skeleton XML document. Oxygen XML Editor creates this document in a new editor panel when you click **OK**.

XSLT Document Configuration Page

Figure 60. New XSLT Stylesheet Configuration Wizard Page



If you selected **XSLT Stylesheet** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

Stylesheet version

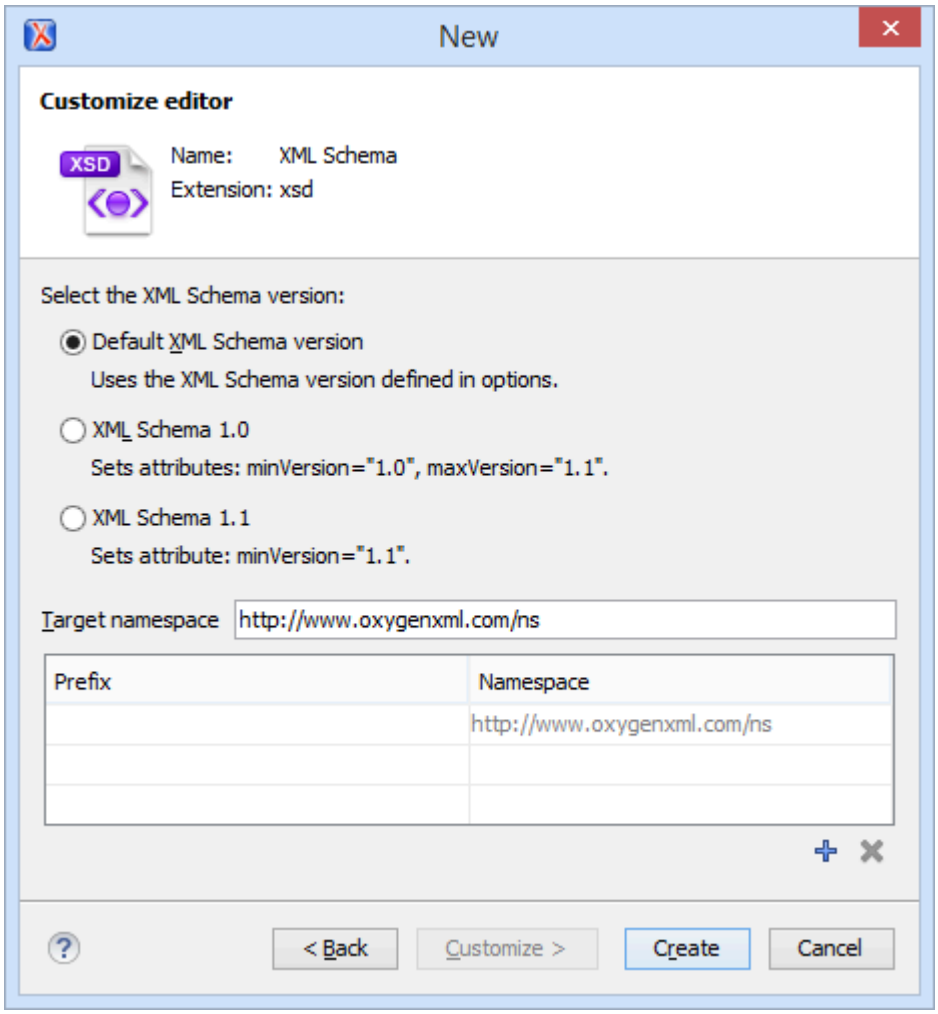
Allows you to select the **Stylesheet version** number. You can select from: `1.0`, `2.0`, `3.0`, and `4.0`.

Add documentation annotations

Select this option to generate the stylesheet annotation documentation.

XML Schema Document Configuration Page

Figure 61. New XML Schema Configuration Wizard Page



If you selected **XML Schema** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

Default XML Schema version

Uses the XML Schema version defined in the **XML Schema** preferences page *(on page 247)*.

XML Schema 1.0

Sets the `@minVersion` attribute to **1.0** and the `@maxVersion` attribute to **1.1**.

XML Schema 1.1

Sets the `@minVersion` attribute to **1.1**.

Target namespace

Allows you to specify the schema target namespace.

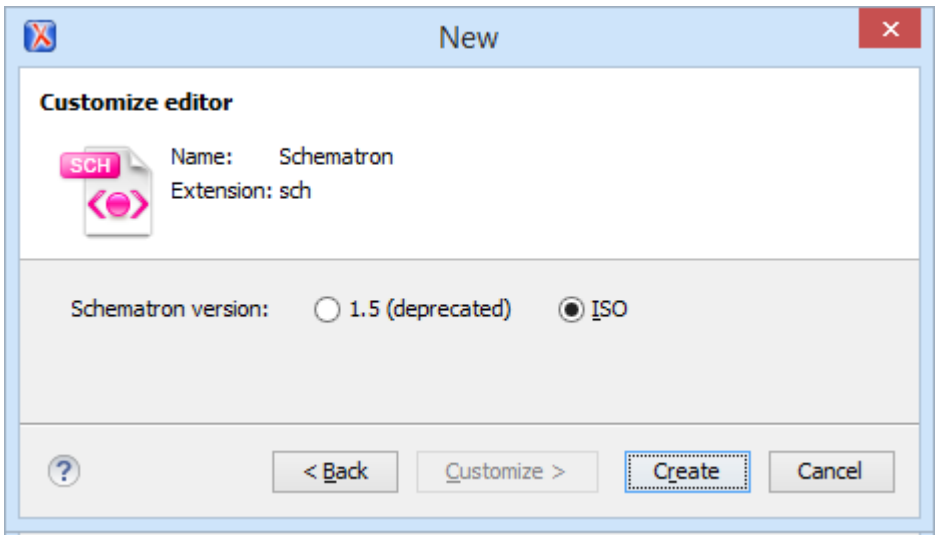
Namespace prefix declaration table

This table contains namespace prefix declarations. Table information can be managed using the **New** and **Delete** buttons.

Tip:
For further details on how you can set the version of an XML Schema, go to Setting the XML Schema Version *(on page 1045)*.

Schematron Document Configuration Page

Figure 62. New Schematron Configuration Wizard Page



If you selected **Schematron** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following option:

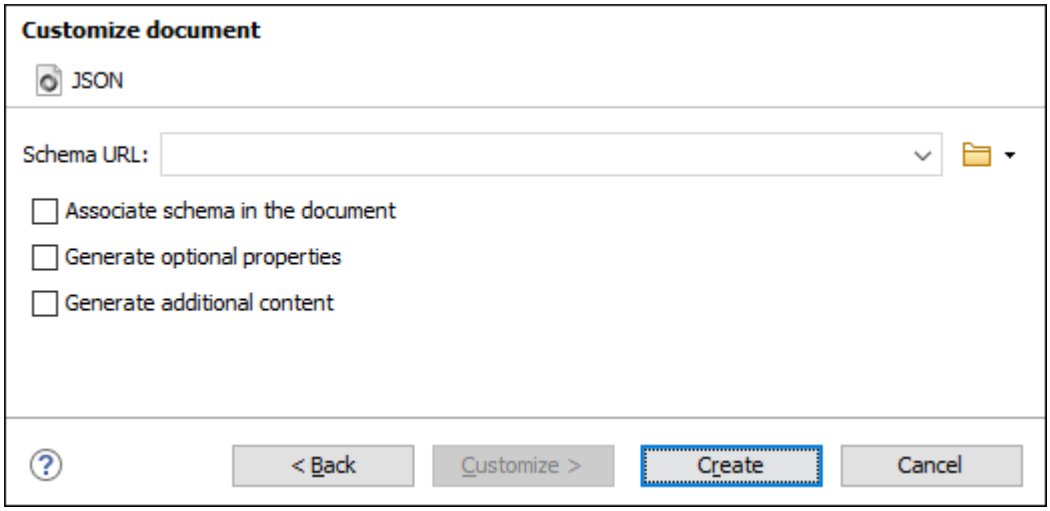
Schematron version

Specifies the Schematron version. Possible options: `1.5` (deprecated) and `ISO`.

Note:
Starting with version 16.0 of Oxygen XML Editor, the support for Schematron 1.5 is deprecated. It is recommended to use ISO Schematron instead.

JSON Document Configuration Page

Figure 63. New JSON Configuration Wizard Page



If you select  **JSON** for the type of file you want to create and select the **Customize** option, the configuration dialog box will include the following options:

Schema URL

Specifies the path to a JSON schema file that will be used to generate *key-value* pairs.

Associate Schema in the Document

If you select this option, the JSON instance will be generated with the JSON schema associated directly in the document.

Generate Optional Properties

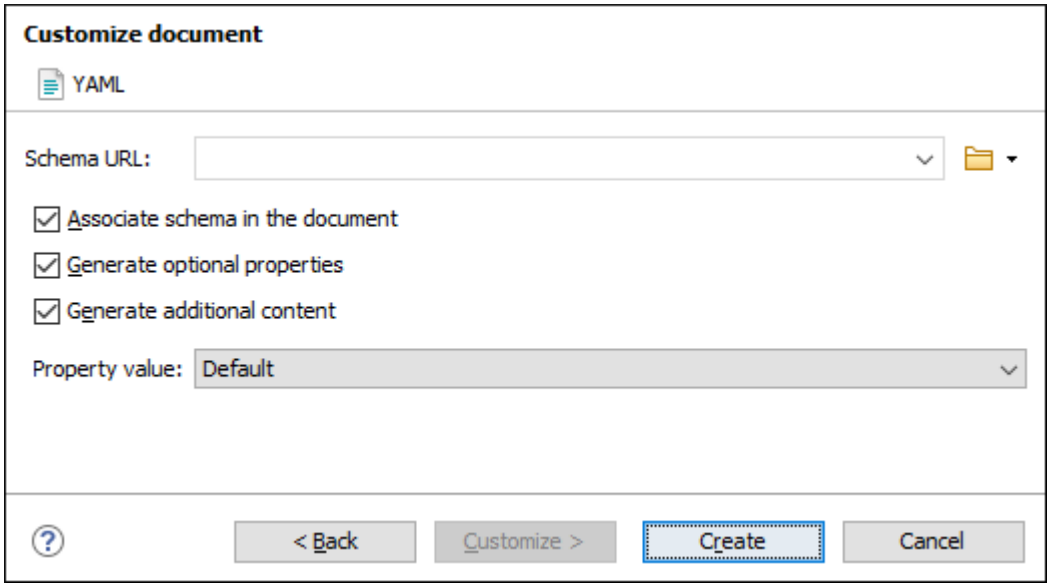
If you select this option, the JSON instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

Generate Additional Content

If you select this option, the JSON instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an array).

YAML Document Configuration Page

Figure 64. New YAML Configuration Wizard Page



If you select **YAML** for the type of file you want to create and select the **Customize** option, the configuration dialog box will include the following options:

Schema URL

Specifies the path to a JSON schema file that will be used to generate *key-value* pairs.

Associate Schema in the Document

If you select this option, the YAML instance will be generated with the JSON schema associated directly in the document.

Generate Optional Properties

If you select this option, the YAML instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

Generate Additional Content

If you select this option, the YAML instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an array).

Property Value

Specifies the method of generating values for the properties. Possible values: **None**, **Default**, **Random**.

Creating New Document Templates

Oxygen XML Editor allows you to create your own custom document templates and they will appear in the **New** document wizard *(on page 377)*.

Creating a New Document Template

To create your own custom document template and have it appear in the new document wizard, follow these steps:

1. Create a new file (whatever type of document you need) and customize it to become a starting point for creating new files of this type.

   > **Tip:**
   > You can use editor variables *(on page 332)* in the template file content and they will be expanded when the files are opened. Also, see Customizing Document Templates *(on page 387)* for other template customization tips (for example, you could add placeholders or hints *(on page 390)* to assist authors).

2. Save the new document template and reference that location in Oxygen XML Editor. There are several options for doing this:
   - **Saving the new template in a specific framework's directory** - Save the new template in a directory (for example, called `templates`) within that specific framework directory (usually a custom framework *(on page 2248)*). Then open the **Document Type** configuration dialog box *(on page 147)* for that specific framework, go to the **Templates** tab *(on page 170)*, and click the ✚ button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, `${frameworkDir}/templates`). You can also remove any existing entries in the list that aren't applicable or won't be used in your custom framework. Click **OK** to close the configuration dialog box and then **OK** or **Apply** to save your changes.
   - **Saving the new template in the Oxygen installation directory** - Save the new template in the `templates` directory of the Oxygen XML Editor installation directory (*`[OXYGEN_INSTALL_DIR]`*`/templates`). Document templates saved in this directory will appear in the **Global templates** category in the **New** document wizard *(on page 377)*.
   - **Saving the new template in a custom directory** - Save the new template in any directory of your choice and then add that directory to the list of templates in the **Document Templates** preferences page *(on page 174)*. This user-defined directory will appear in the **New** document wizard *(on page 377)* along with all the new document templates that you save inside it. Click **OK** or **Apply** to save your changes.

   > **Tip:**
   > If you want to create a new template for a binary file (e.g. a zip archive), you need to add *.bin* to the end of the file name (for example, **.zip.bin* or **.epub.bin*). Otherwise, the files will be treated as XML/text documents and you will be prompted to choose the editor type.

Attention:
The name that you use to save the template will be the name that appears in the new document wizard, including capitalization, space, and characters (for example, `My Custom Template1.xml` will appear in the new file wizard as **My Custom Template1**). You can also configure the displayed name in a properties file by following the procedure found in the Configure the Displayed Names for Document Templates *(on page 389)* section.

3. Open the new document wizard (**New** toolbar button or **File > New**) and you should see your custom template in the appropriate folder.

Note:
For DITA templates, they will also appear in the dialog box for creating new DITA topics from the **DITA Maps Manager**, but if you customize the template *(on page 387)*, you need to set the `type` property to **dita** in the corresponding properties file.

Related information
Customizing Document Templates *(on page 387)*
Sharing Custom Document Templates *(on page 391)*

Customizing Document Templates

Oxygen XML Editor allows you to customize certain aspects of built-in or custom document templates. For example, you can customize the icons or specify a prefix/suffix that will be used for the proposed file name in the **New** document wizard *(on page 377)*.

Customizing the Icons for a Document Template

If you want to customize the icons to be used for document templates, use a properties file to specify the icons using the following procedure:

1. Create a new properties file or edit an existing one following these guidelines:
   a. If you want to create a new properties file, you can use the **Properties** template found in the **New Document** folder in the **New** document wizard *(on page 377)*. If you want to edit an existing template, you can find them within the subfolders in the `templates` folder for each framework (for example, the DITA topic properties file is located in: `OXYGEN_INSTALL_DIR/frameworks/dita/templates/topic/topic.properties`).
   b. Use the same name as your custom template file except with a `.properties` extension (for example, `MyTemplate.properties`).
   c. In this properties file, specify the paths to the icons that will be used in the new file wizard. The properties file should look like this:

```
type=general
smallIcon=../icons/Article_16.png
bigIcon=../icons/Article_48.png
```

Tip:
For DITA files, the `type` property must be set to **dita**. Otherwise, the template will not appear in the dialog box for creating new DITA topics from the **DITA Maps Manager** *(on page 3073)*. For all other types of files, set it to **general**. The icons specified in this properties file will only be used for the new file wizards and not in any other part of the interface.

Important:
If you created a new template and chose to use a custom directory for the new template (in step 2 of the new template procedure *(on page 386)*), make sure that the path to the icons is relative to that directory.

2. Save the properties file in the same directory as your custom template.
3. Open the new file wizard (**File > New**) and you should see your custom icons next to the document template in the appropriate folder.

Add a Prefix or Suffix to File Names for a Document Template

You can use a properties file for each document template to add a prefix or suffix to the file name that is proposed in certain dialog boxes when you create a new file from that template. This applies to the following new document dialog boxes:

- The new document dialog box that appears when you click the **New** button on the toolbar (or **File > New**). The prefix or suffix is added to the name of the file in the **Save as** field.
- The new document dialog box that appears when you select **New > File** from the contextual menu in the **Project** view *(on page 413)*. The prefix or suffix is added to the name of the file in the **File name** field.
- For DITA files, it also applies to the new document dialog box that appears when you select **Append Child > New**, **Insert Before > New**, or **Insert After > New** from the **DITA Maps Manager** *(on page 3073)*. The prefix or suffix is added to the name of the file in the **Save as** field.
- For DITA files, it also applies to the **Fast Create Topics** dialog box *(on page 3141)* that you can use to create multiple skeleton topics at once.

To add a prefix or suffix to the file names for a document template, follow these steps:

1. Create a new properties file or edit an existing one.
   - If you create a new properties file, use the same name as the template file except with a `.properties` extension (for example, `MyTemplate.properties`). This properties file specifies the prefix/suffix that will be used to propose the file name in the new file wizards.

     When defining the prefix/suffix, the properties file should look something like this:

     ```
     type=general
     filenamePrefix=prod_
     filenameSuffix=_test
     ```

     Important:
     For DITA files, the `type` property must be set to **dita**. For all other types of files, set it to **general**.

   - If you edit an existing template, simply define the prefix/suffix as specified above *(on page 389)*.
2. Save the properties file in the same directory as the document template.
3. Open the new document wizard (using the methods described above *(on page 388)*) and when you select the appropriate template, you should see your prefix or suffix in the file name that is proposed in that dialog box.

Note:
The `filenamePrefix` and `filenameSuffix` properties can also have editor variables *(on page 332)* that do not require user interaction (i.e. editor variables that have `${ask()}` and `${answer()}` as values cannot be used).

Configure the Displayed Names for Document Templates

To change the name that is displayed for a document template, use the following procedure:

1. Create a new properties file or edit an existing one. If you create a new properties file, use the same name as the template file except with a `.properties` extension (for example, `MyTemplate.properties`).
2. Add a `displayName` property in the properties file:

   ```
   displayName=My Template Name
   ```

   Tip:
   The names for *framework (on page 3420)*-specific document templates (such as DITA *Topic* or DocBook *Article*, as you would see in the **Framework templates** folder in the **New** file wizard) can be translated via the internationalization support. In this case, the properties file should contain something like:

```
displayName=${i18n(tag)}
```

where *tag* refers to an entry in the `translation.xml` file for that specific framework (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/i18n/translation.xml` for DITA).

3. Save the properties file in the same directory as the document template.
4. Open the new file wizard (**File > New**) and you should see the new name for the template.

Adding Placeholders or Hints in a Document Template

If a document template contains empty elements, it may not be clear to the Author what should be inserted in them. You can define placeholders in document templates that provide hints for Authors to help them understand what type of content should be added in any particular empty element within the document. The placeholder text is specified using a processing instruction and the placeholders are removed when the Author inserts content in the corresponding element.

To define placeholders in a document template to provide authors with hints, follow this procedure:

1. Edit the document template.
2. Add placeholders in the form of processing instructions within the elements where you want hints to be displayed when an Author creates a document from the template. For example:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="pi">
  <title><?oxy-placeholder content="Enter a title"?></title>
    <shortdesc><?oxy-placeholder content="Writing short descriptions
         induces the writer to clarify the main thesis of the topic.
         We recommended a 50 word limit."?></shortdesc>
  <body>
    <p><?oxy-placeholder content="A paragraph element should be a self-contained
         unit dealing with one idea or point."?></p>
  </body>
</topic>
```

Important:
The elements that contain the placeholder processing instructions cannot contain other content/text, not even whitespace used for indentation. Otherwise, the placeholder will not be rendered properly.

3. Save the template file.
4. Use the **New** document wizard *(on page 377)* to create a new document using your customized template and you should see the hints in the open document.

Creating New Document Templates *(on page 385)*

Sharing Custom Document Templates *(on page 391)*

Sharing Custom Document Templates

Your custom document templates *(on page 385)* can be shared with the other members of your team so that they all have access to the templates in the **New** document wizard *(on page 377)*. The best way to share them is by integrating them in an extended *framework (on page 3420)* (document type) configuration and then sharing the whole framework with the other users.

Sharing Custom Document Templates

To share custom document templates with other members of your team:

1. Create a custom framework by extending an existing one *(on page 2248)*, if you have not already done so.
2. Create the new document template *(on page 385)*, if you haven't already done so.
3. Save the new template in a directory (for example, called `templates`) within your custom framework directory. Then open the **Document Type** configuration dialog box *(on page 147)* for that specific framework, go to the **Templates** tab *(on page 170)*, and click the + button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, `${frameworkDir}/templates`). You can also remove any existing entries in the list that aren't applicable or won't be used in your custom framework.
4. Click **OK** to close the configuration dialog box and then **OK** or **Apply** to save your changes.
5. All that remains is to share the entire framework with anyone who needs to have access to the custom templates. There are several methods for sharing frameworks and you can find details here: Sharing a Framework *(on page 2406)*.

Related information

Sharing a Framework *(on page 2406)*

Opening Documents

To open a document in Oxygen XML Editor, do one of the following:

- Go to **File >** **Open (Ctrl + O (Command + O on macOS))** or click the **Open** toolbar button to display the **Open File** dialog box. The start folder of this dialog box can be either the last folder it visited or the folder of the currently selected file. This can be configured in the Global preferences page. *(on page 133)*
- Go to **File > Open URL** or click the **Open URL** toolbar button to display a dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the **Browse for remote file** drop-down menu.
- Click the **Open/Find Resource** toolbar button to search for a file to open.
- Go to **File >** **Reload** to load the last saved file content. All unsaved modifications are lost.
- Go to **File > Reopen** to reopen one of the recently opened document files. The list containing recently opened files can be emptied by invoking the **Clear history** action.
- Select the **Open** or **Open with** action from the contextual menu of the **Project** view *(on page 413)*.

Related information

Opening Local Files at Start-up *(on page 392)*

Opening the Current Document in a System Application

To open the currently edited document in the associated system application, use the **View in Browser/ System Application** action that is available in the **File** menu and on the **File** toolbar. If you want to open XML files in a specific internet browser, instead of the associated system application, you can specify the internet browser to be used. To do so, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

Opening Local Files at Start-up

There are two possibilities for opening local files at startup from a command line by adding their file paths as parameters:

- **scriptName [pathToXMLFile1] [pathToXMLFile2]**
  - **scriptName** is the name of the startup script for your platform (oxygen.bat on Windows, `oxygen.sh` on macOS and Linux).
  - **pathToXMLFileN** is the name of a local XML file.

- An XML file and a schema file to be associated automatically to the file and used for validation and content completion:

```
scriptName -instance pathToXMLFile -schema pathToSchemaFile -schemaType XML_SCHEMA|DTD_SCHEMA|
RNG_SCHEMA|RNC_SCHEMA -dtName documentTypeName
```

  - **scriptName** is the name of the startup script for your platform (`oxygen.bat` on Windows, or `oxygen.sh` on macOS and Linux).
  - **pathToXMLFile** is the name of a local XML file.

- **pathToSchemaFile** is the name of the schema that you want to associate to the XML file, the four constants (XML_SCHEMA, DTD_SCHEMA, RNG_SCHEMA, RNC_SCHEMA) are the possible schema types (XML Schema, DTD, Relax NG schema in full syntax, Relax NG schema in compact syntax).
- **documentTypeName** specifies the name of the document type that has the schema defined. If the document type is already set in preferences, its schema and type are updated.

Tip:
You can use the *-h* or *--help* parameters to see more detailed information about possible values.

Related information
Opening a Document at a Specific Location Using a Command-Line Interface *(on page 393)*

Opening a Document at a Specific Location Using a Command-Line Interface

Oxygen XML Editor offers support for opening a file at a specific position using a command-line interface to transmit parameters to the Oxygen XML Editor application launching script file (`oxygen.bat`/`oxygen.sh`). The following methods are available, depending on how you identify the position that is needed:

1. **Specific position values (line and column number, or character offset)**

   Oxygen XML Editor supports the following position parameters:
   - **line** - The line number.
   - **column** - The column number (has meaning if the `line` parameter is also defined).
   - **char** - The character offset.

   Examples for Windows:

   The following examples show how you can open an XML document in Oxygen XML Editor from a Windows command-line interface:

   ```
   oxygen.bat  file:samples/personal.xml#line=4
   oxygen.bat  file:samples/personal.xml#line=4column=5
   oxygen.bat  file:samples/personal.xml#line=4;column=5
   oxygen.bat  file:samples/personal.xml#char=334
   ```

2. **Simplified XPath index path**

   Oxygen XML Editor will open an XML file and select one of its elements identified by a simplified XPath index path. For example, an index path of the form 1/5/7 identifies the seventh child of the fifth child of the root element.

Restriction:
Oxygen XML Editor will display a selection that starts with the first character of the content of the identified element and spans until the end of the line.

Examples for Windows:

The following example shows how you can open an XML document in Oxygen XML Editor and select the third child of the root element using a Windows command-line interface:

```
oxygen.bat  file:samples/personal.xml#element(1/3)
```

3. **Anchors identified by ID attribute values**

   Oxygen XML Editor will open an XML file and select the element whose `@id` attribute value is an exact match of the *anchor (on page 3417)* attached to a command-line instruction.

   Examples for Windows:

   The following example shows how you can open an XML document in Oxygen XML Editor and select the element that has the `@id` set to `titleID` using a Windows command-line interface:

   ```
   oxygen.bat  file:samples/personal.xml#titleID
   ```

Related information
Opening Local Files at Start-up *(on page 392)*

Saving Documents

You can save the document you are editing with one of the following actions:

- **File >** **Save**.
- **Save** toolbar button - If the document was not yet saved, it displays the **Save As** dialog box.
- **File > Save As** - Displays the **Save As** dialog box, used either to name and save an open document to a file or to save an existing file with a new name.
- **File > Save To URL** - Displays a **Save to URL** dialog box that can be used to save a file identified by its URL (defined by a protocol, host, resource path, and an optional port). You can also use the browsing actions in the **Browse for remote file** drop-down menu.
- **File > Save All** - Saves all open documents. If any document does not have a file, displays the **Save As** dialog box.

Auto Recover Documents

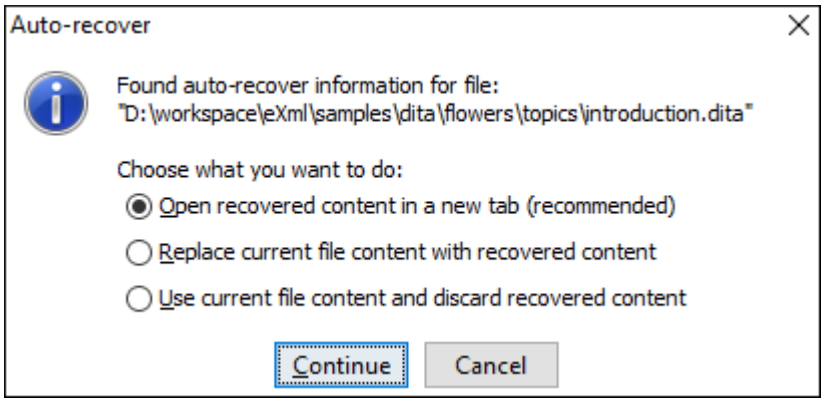
Oxygen XML Editor includes an *Auto Recover* feature to help prevent losing unsaved content if you encounter an application or system crash. The feature is enabled by default and it automatically saves documents you

are working on to a specified auto-recover file location. At every specified interval, all documents that have been modified since the last auto-save are saved to the specified location.

This feature is controlled by two options in the **Save** preferences page. You can disable it, or configure how often content is saved by selecting the desired value in the drop-down list of the **Save auto-recover information every** option *(on page 209)*, and you can specify the location of the saved documents in the **Auto-recover file location** option *(on page 209)*.

In the event of an application or system crash, once you restart the application, Oxygen XML Editor looks for an auto-recover file for each document that is either automatically or manually reopened. If an auto-recover file is found, a dialog box is displayed with options for how to handle the recovered information.

Figure 65. Auto Recover Dialog Box



The dialog box offers the following choices:

- **Open recovered content in a new tab** - Opens the recovered document in a new tab.

  Tip:
  You can use the **Compare Files** tool (available in the **Tools** menu) to compare the recovered content with the last saved version of the document.

- **Replace current file content with recovered content** - Replaces the content of the last saved version of the document with the content of the recovered version of the document and removes the auto-recover file from disk.
- **Use current file content and discard recovered content** - Discards the recovered document and retains the last saved version of the document.

Notes About the Auto-Recover Feature:

- The *Auto Recover* feature works for both local and remote files.
- For DITA projects, the *Auto Recover* feature also works for DITA maps opened in the **DITA Maps Manager**.

- The *Auto Recover* feature does NOT work if there is not enough space available on the disk where the auto-recover file location is specified *(on page 209)*.
- The *Auto Recover* feature does NOT work on files opened in the *huge file editor (on page 481)* (if you select the **Optimize loading for huge files** option when opening large documents *(on page 479)*).

Closing Documents

To close open documents, you can simply click the close icon (✕) for the particular editor tab or use one of the following actions that are available by right-clicking the current editor tab (or from the **File** menu):

Close (Ctrl + W (Command + W on macOS))

Closes the currently selected editor.

Close Other Files

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs except for the one you are currently viewing. If this action is selected from the **File** menu, it closes all opened editors in **all** groups/stacks of tabs except for the current one.

Close Files to the Right

Available only from the contextual menu of the current editor tab and it closes all opened editors to the right of the currently selected editor.

Close All

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs. If this action is selected from the **File** menu, it closes all opened editors in **all** groups/stacks of tabs.

Working with Remote Documents

Oxygen XML Editor supports editing remote files, using the WebDAV , SharePoint, and SharePoint Online for Office 365, FTP (Deprecated), SFTP (Deprecated) protocols. You can edit remote files in the same way you edit local files. For example, you can add remote files to a project, or use them in XSL and FO transformations.

You can open one or more remote files in the **Open URL** dialog box *(on page 397)*.

A WebDAV resource can be locked when it is opened in Oxygen XML Editor by selecting the **Lock WebDAV files on open** option *(on page 313)* to prevent other users to modify it concurrently on the server. If a user tries to edit a locked file, Oxygen XML Editor displays an error message that contains the lock owner's name. The lock is released automatically when the editor for that resource is closed in Oxygen XML Editor.

To avoid conflicts with other users when you edit a resource stored on a SharePoint server, you can **Check Out** the resource.

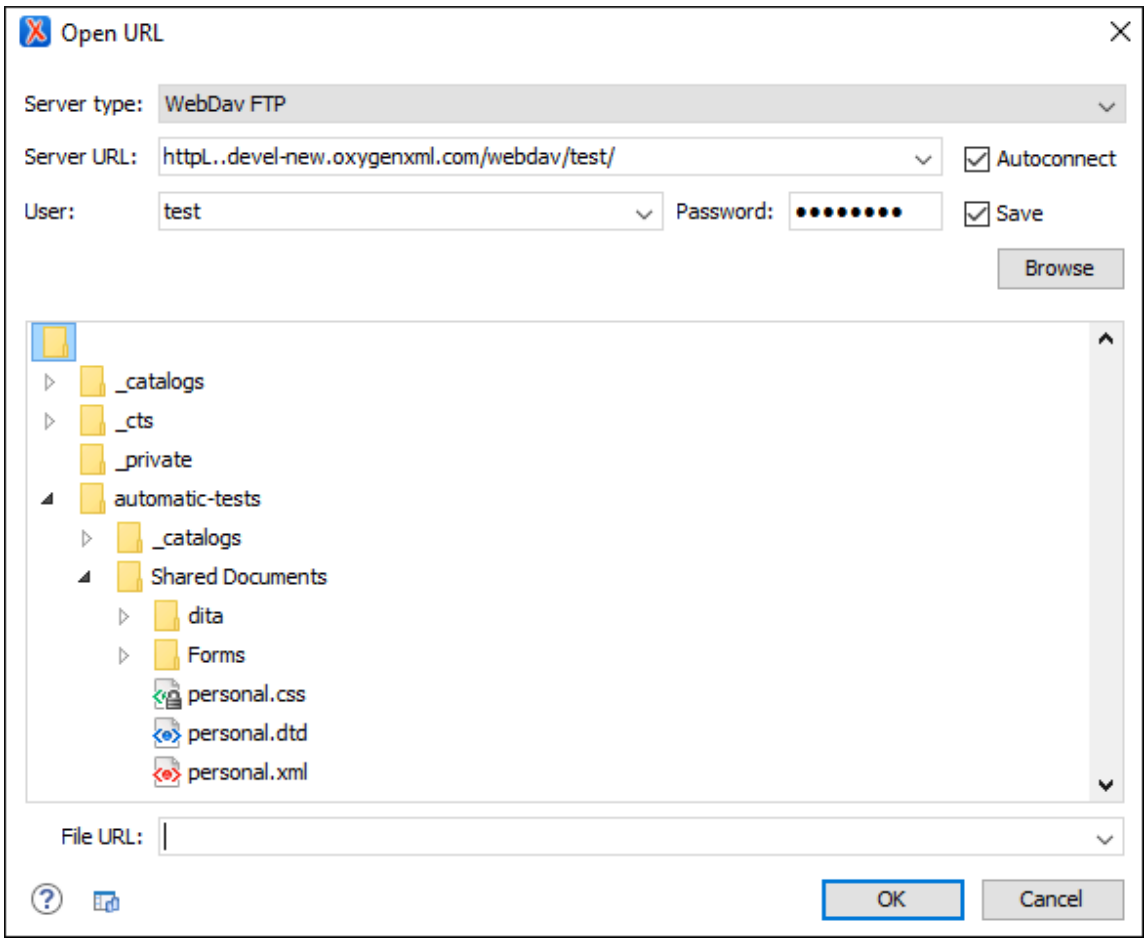
To improve the transfer speed, the content exchanged between Oxygen XML Editor and the HTTP / WebDAV server is compressed using the GZIP algorithm.

The current WebDAV Connection *(on page 2179)* details can be saved by switching to the **Database** *perspective (on page 3422)* and then you can browse and manage the connection in the **Data Source Explorer** view *(on page 2133)*.

Open URL

To open this dialog box, go to **File >** **Open URL** (or click the **Open URL** toolbar button), then choose the **Browse for remote file** option from the drop-down action list.

Figure 66. Open URL Dialog Box



The displayed dialog box is composed of the following:

Server Type

Specifies the type of server. You can choose between:

- **WebDav FTP** - For generic HTTP/FTP/WebDav and other servers.
- **SharePoint Online** - For SharePoint Online servers.
- **SharePoint On-Premises** - For SharePoint (older version) servers.

Server URL

Specifies the protocol (HTTP, HTTPS or FTP) and the host name or IP of the server.

Tip:
When specifying a URL, follow these rules:

- To access an FTP server, write the protocol, host, and port (if using a non-standard one). For example, `ftp://server.com` or `ftp://server.com:7800/`.
- To access a WebDAV server, write the path to the directory of the WebDAV repository along with the protocol and the host name. For example, `https://www.some-webdav-server.com:443/webdav-repository/`.

Important:
Make sure that the repository directory ends in a slash "/". For example, `https://www.some-webdav-server.com:443/webdav-repository/`

Autoconnect

If selected, the browse action is performed every time when you open the dialog box.

User and Password

To browse for a file on a server, you have to specify the user and password for the server. This information is bound to the selected URL displayed in the **File URL** combo box, and used further in opening/saving the file.

Note:
Your password is well protected. If the options file is used on another machine by a user with a different username, the password will become unreadable since the encryption is dependent on the username. This is also true if you add URLs that contain a username and password to your project.

Save

If selected, the user and password are saved between editing sessions. The password is kept encrypted in the options file.

Browse

When you click this button, the directory listing will be shown in the main section of the dialog box. If the selected URL points to a SharePoint server, a dedicated SharePoint browsing component is presented.

Browser view

- If you are browsing a WebDAV or FTP repository, the items are presented in a tree-like fashion. You can browse the directories, and make multiple selections. Additionally, you may use the **Rename**, **Delete**, and **New Folder** actions to manage the file repository.

> **Note:**
> The file names are sorted in a case-insensitive way.

- When you browse a SharePoint repository, a specialized component renders the SharePoint site content.

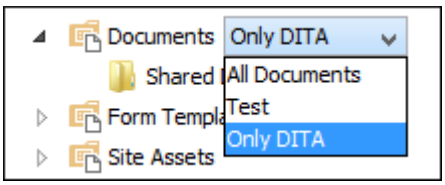
  The left side navigation area presents the SharePoint site structure in a tree-like fashion with various node types (such as *sites*, *libraries*, and *folders*).

  Depending on the type of node, a contextual menu offers customized actions that can be performed on that node. The contextual menu of a folder allows you to create new folders and documents, import folders and files, and to rename and delete the folder.

> **Note:**
> The rename and delete actions are not available for library root folders (folders located at first level in a SharePoint library).

  Each library node displays a drop-down menu next to its name where you can select what you want to display for the current library node. This functionality is also available on the contextual menu of the node.

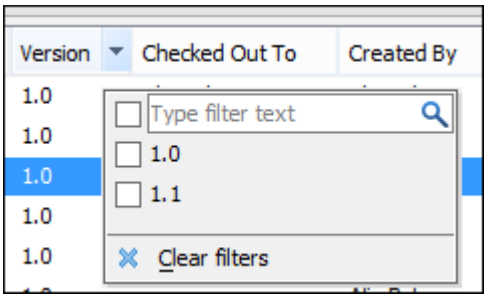
Figure 67. Drop-Down Menu to Select Which Items to Display



The content of a folder is displayed in a tabular form, where each row represents the properties of a folder or document. The list of columns and the way the documents and folders are organized depends on the currently selected view of the parent library.

You can filter and sort the displayed items. To display the available filters of a column, click the filter widget located on the column header. You can apply multiple filters at the same time.

Figure 68. Column Filter



File URL

You can use this combo box to directly specify the URL to be opened or saved. You can type a URL such as `http://some.site/test.xml` (if the file is accessible through normal HTTP protocol), or `ftp://anonymous@some.site/home/test.xml` (if the file is accessible through anonymous FTP).

This combo box also displays the current selection when the user changes selection by browsing the tree of folders and files on the server.

Changing File Permissions on a Remote FTP Server

Some FTP servers allow the modification of permissions of the files served over the FTP protocol. This protocol feature is accessible directly in the FTP/WebDAV file browser dialog box by right-clicking a tree node and selecting the *Change permissions* menu item.

In this dialog box, the usual Unix file permissions *Read*, *Write*, and *Execute* are granted or denied for the file owner, owner group, and the rest of the users. The aggregate number of permissions is updated in the *Permissions* text field when it is modified with one of the checkboxes.

WebDAV over HTTPS

If you want to access a WebDAV repository across a non-secure network, Oxygen XML Editor allows you to load and save the documents over the HTTPS protocol (if the server understands this protocol) so that any data exchange with the WebDAV server is encrypted.

When a WebDAV repository is first accessed over HTTPS, the server hosting the repository will present a security certificate as part of the HTTPS protocol, without any user intervention. Oxygen XML Editor will use this certificate to decrypt any data stream received from the server. For the authentication to succeed you should make sure the security certificate of the server hosting the repository can be read by Oxygen XML Editor. This means that Oxygen XML Editor can find the certificate in the key store of the Java Runtime

Environment where it runs. You know the server certificate is not in the JRE key store if you get the error *No trusted certificate found* when trying to access the WebDAV repository.

Troubleshooting HTTPS

If Oxygen XML Editor cannot connect to an HTTPS-capable server and an error message appears stating that it is "unable to find a valid certification path to the requested target", the HTTPS server is most likely either configured to use a self-signed certificate or to use a certificate issued by an unknown authority that the *Java Runtime Environment (JRE)* used by Oxygen XML Editor does not trust.

Note:
For Windows, starting with version 26.0, by default, Oxygen XML Editor uses the trusted root certificates from the Windows certificate store instead of the JRE cacerts store. To trust a certificate, the root certificate should be imported in the Windows Trusted Root certificates store.

Tip:
To make Oxygen XML Editor accept a certificate even if it is invalid, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Connection settings > HTTP(S)/WebDAV**, and select the **Automatically accept a security certificate, even if invalid** option.

To trust a certificate, follow this procedure:

1. Export a certificate into a local file using any HTTPS-capable web browser:

   Chrome or Edge

   a. Navigate to the page that uses the certificate.
   b. Right-click the page and select **Inspect**.
   c. Select the **Security** tab.
   d. Click **View Certificate**.**Step Result:** A **Certificate** dialog box is displayed.
   e. Select the **Details** tab of the **Certificate** dialog box.
   f. Click the **Export** button.
   g. In the resulting dialog box, for the **Save as type** option, select **DER-encoded binary, single certificate (*.der)**.
   h. Save the certificate to the local file `server.der`.

   Safari

   a. Navigate to the page that uses the certificate.
   b. If there is a *"This connection is not private"* message, click **Show Details** and in the expanded panel, click **view the certificate**.

c. Otherwise, in the address bar, click the *padlock icon* on the left side of the website name and in the displayed pop-up, click **Show Certificate**.
d. Another pop-up box is displayed showing information about the **certificate**. Drag the large **certificate** icon to a *Finder* window. A `.cer` file will be created in the indicated folder from *Finder*.

2. Import the local file into the JRE running Oxygen XML Editor:
   a. Open a text-mode console with administrative rights.If Oxygen XML Editor has been installed in a user's home directory and includes a bundled JRE, administrative rights are not required. In all other cases, administrative rights will be required.
   b. Go to the `lib/security` directory of the JRE running Oxygen XML Editor. You can find the home directory of the JRE in the *java.home* property that is displayed in the **About** dialog box (**System properties** tab).

      Note:
      On macOS, for the distribution of Oxygen XML Editor that bundles the JRE from Oracle, the JRE uses the `.install4j/jre.bundle/Contents/Home/jre/lib/security/cacerts` path within its installation directory.

   c. Run the following command:

      ```
      ..\..\bin\keytool -import -trustcacerts -file server.cer -keystore cacerts
      ```

      The `server.cer` file contains the server certificate, created during the previous step. The *keytool* requires a password before adding the certificate to the JRE *keystore (on page 3421)*. The default password is `changeit`. If someone changed the default password, then that person is the only one who can perform the import.

      Tip:
      If you need to import multiple certificates, you need to specify a different alias for each additional imported certificate with the `-alias` command-line argument, as in the following example:

      ```
      ..\..\bin\keytool -import -alias myalias1 -trustcacerts -file
      server1.cer -keystore cacerts

      ..\..\bin\keytool -import -alias myalias2 -trustcacerts -file
      server2.cer -keystore cacerts
      ```

3. Restart Oxygen XML Editor.

Related information
HTTP(S)/WebDAV Preferences *(on page 312)*

HTTP Authentication Schemes

Oxygen XML Editor supports the following HTTP authentication schemes:

- **Basic** - The *basic* authentication scheme defined in the RFC2617 specifications.
- **Digest** - The *digest* authentication scheme defined in the RFC2617 specifications.
- **NTLM** - The *NTLM* scheme is a proprietary Microsoft Windows Authentication protocol (considered to be the most secure among currently supported authentication schemes).

  Note:
  For NTLM authentication, the user name must be preceded by the name of the domain it belongs to, as in the following example:

  ```
  domain\username
  ```

- **Kerberos** *(on page 403)* - An authentication protocol that works on the basis of *tickets* to allow nodes communicating over a non-secure network to prove their identity to one another in a secure manner.

Single Sign-on

Oxygen XML Editor implements the *Single sign-on* property (meaning that you can log on once and gain access to multiple services without being prompted to log on for each of them), based on the **Kerberos** protocol and relies on a *ticket-granting ticket (TGT)* that Oxygen XML Editor obtains from the operating system.

Restriction:
This *Single sign-on* support is not available for SharePoint integrations.

To turn on the **Kerberos**-based authentication, you need to add the following system property in the `.vmoptions` configuration file or start-up script:

```
-Djavax.security.auth.useSubjectCredsOnly=false
```

Related information

Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor *(on page 348)*

Switching, Moving, or Hiding Editor Tabs

Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them, and you can even hide the tabs to only show the currently open file.

Note:
If multiple file tabs are left open when you close the application, upon startup, Oxygen XML Editor will not load the file content until you switch to the corresponding file tab. The tabs remain visible as a placeholders until the focus is switched to them. This helps to improve the application's startup

time. If you want to disable this feature (meaning that the previously open files will all be re-loaded at startup), deselect the **Load file content only when switching to its corresponding editor tab** option in the **Global** preferences page *(on page 134)*.

Switching Editor Tabs

You can switch between editor tabs by using any of the following methods:

Mouse and Scroll Wheel

Of course, you can switch to a different editor tab by left-clicking the tab with your mouse, but when there are too many open tabs to fit on the screen, you can hover over the tab stripe and use the scroll wheel on your mouse to scroll to the left or right (same as using the two arrows on the far-right of the tab stripe).

Buttons on the Far-Right of the Tab Stripe (◂ ▸ ☰)

You can use the arrow buttons (◂ ▸) on the right side of the tab stripe to scroll to the left or right and the ☰ **Show List** button opens a pop-up window that displays all the open file tabs and allows you to select and switch to a specific open file.

Ctrl + Tab (Command + Tab on macOS) [NOTE: Ctrl + Page Down (Ctrl + Option + Right Arrow on macOS) does the same]

Switches to the next open tab in the order specified in the **Order of switching between editor tabs** option *(on page 135)*.

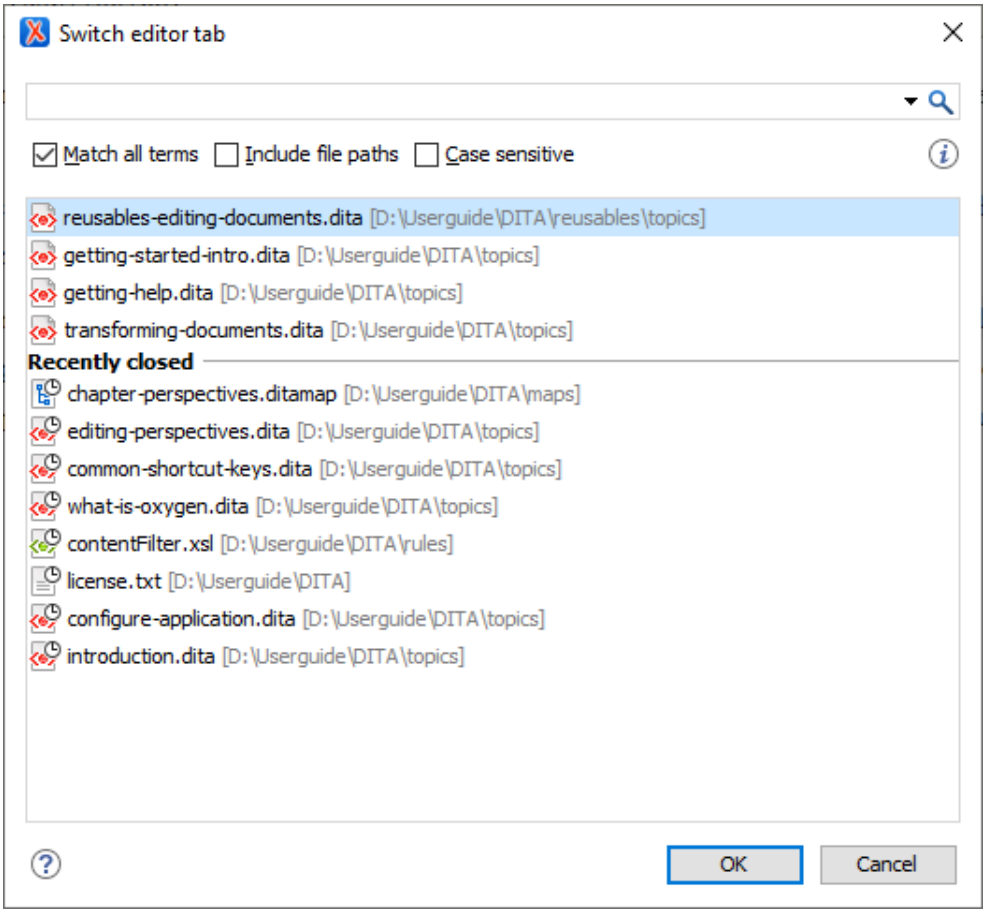
Ctrl + Shift + Tab (Command + Shift + Tab on macOS) [NOTE: Ctrl + Page Up (Ctrl + Option + Left Arrow on macOS) does the same]

Switches to the previous open tab in the order specified in the **Order of switching between editor tabs** option *(on page 135)*.

Window > Switch editor tab (Ctrl + F9 (Command + F9 on macOS))

This action opens a dialog box that allows you to switch to a particular editor tab by selecting it from a filterable list. This is especially helpful when you have a large amount of open file tabs and you want to switch to a certain tab this is not shown on the screen. It includes a search filter field and several options to help you find specific open file tabs.

Figure 69. Switch Editor Tab Dialog Box



The **Switch Editor Tab** dialog box contains the following options and features:

Search Filter

You can enter text in the filter field at the top of the dialog box to filter the list and search for specific open files. You can enter any number of terms, separated by space, and wildcards are allowed (for example, `*` to match any sequence of characters, or `?` to match a single character). This field also has a history drop-down that allows you to select previously used search terms.

Match all terms

If this option is selected, only the files that match all of your search terms will be displayed. If you use a wildcard in the search filter, this option is automatically disabled.

Include file paths

If this option is selected, the search is expanded to include file paths, and also the paths are displayed in this dialog box.

Case sensitive

If this option is selected, the search operation will be case-sensitive.

List of Open File Tabs

All files that are currently open are displayed in the upper part of the main pane of the dialog box, followed by recently closed files. Files that have been modified but not yet saved are prefixed by an asterisk. To switch to a particular file tab, double-click the file or select it and click **OK**.

Moving Editor Tabs

You can move editor tabs by using any of the following methods:

Mouse Drag

You can use your mouse to drag editor tabs to a new location on the tab stripe.

Ctrl + Alt + Comma

Moves the current file tab one position to the left.

Ctrl + Alt + Period

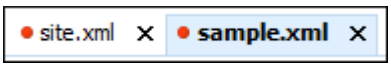
Moves the current file tab one position to the right.

Hiding Editor Tabs

If you want to hide all the file tabs and only show the currently open file, select **Hide editor tabs** from the **Window** menu. This does not close the other tabs, just hides them. You can still navigate between tabs using keyboard shortcuts (**Ctrl + Tab**, **Ctrl + Shift + Tab**, **Ctrl + F6**, **Ctrl + Shift + F6**) or by selecting **Next editor** or **Previous editor** from the **Window** menu.

Contextual Menu of the Current Editor Tab

A contextual menu is available when you right-click the current editor tab label.



The actions that are available depend on the context and the number of files that are opened. The menu includes the following actions:

Close (Ctrl + W (Command + W on macOS))

Closes the currently selected editor.

Close Other Files

If multiple files are opened, this action is available to close all open editors in the current group/stack of tabs except for the one you are currently viewing.

Close Files to the Right

Closes all open editors to the right of the currently selected editor.

Close All

If multiple files are opened, this action is available to close all open editors.

Move editor tab to the left (Ctrl + Alt + Comma)

Moves the current editor tab one position to the left.

Move editor tab to the right (Ctrl + Alt + Period

Moves the current editor tab one position to the right.

Reopen last closed editor Ctrl + Alt + T (Command + Option + T on macOS))

Reopens the last closed editor.

Maximize Editing Area

Collapses all the side views and spans the editing are to cover the entire width of the main window.

Add to project

Adds the file you are editing to the current project.

Add all to project

If multiple files are opened, this action is available to add all the open files in the current group/ stack of tabs to the current project.

Copy Location

Copies the disk location of the file.

Show in Explorer (Show in Finder on macOS)

Opens the Explorer to the file path of the file.

Viewing File Properties

The **Properties** view displays information about the currently edited document. The information includes:

- Character encoding.
- Full path on the file system.
- Schema used for content completion and document validation.
- Document type name and path.
- Associated transformation scenario.
- Read-only state of a file.
- Bidirectional text (left to right and right to left) state.
- Total number of characters in the document.
- Line width.
- Indent with tabs state.
- Indent size.

The view can be accessed from **Window > Show View > Properties**.

To copy a value from the **Properties** view in the clipboard (for example, the full file path), use the **Copy** action available on the contextual menu of the view.

Simple Text Editor

Oxygen XML Editor specializes in XML-related technologies, you can also use it to create and edit various types of non-XML files. Non-XML files are opened in a simple text editor and many of the helpful features that are commonly used when editing XML files in the Oxygen XML Editor **Text** editing mode are available in this simple editor.

Types of Non-XML Files That are Supported in the Simple Text Editor

The types of files that can be created and edited in the simple text editor include:

- Java
- C++
- C
- Dockerfile
- PHP
- Perl
- Properties
- SQL
- PowerShell
- Batch
- Python
- Text

Features Available in the Simple Text Editor

When editing files in the simple text editor, the features that are available include the following:

- **Project Support** - The unique features that are designed to help you work with projects *(on page 409)* are available for all types of files.
- **Shortcut Actions** - Many of the shortcut actions that are available in **Text** mode are also available in the simple text editor.
- **Drag and Drop** - The normal drag and drop support is available in the simple text editor.
- **Content Selection Features** - The content selection shortcuts *(on page 539)* that are available in **Text** mode (including the *Rectangular Selection* feature) are also available in the simple text editor.
- **Bookmarks** - You can use *bookmarks* to mark positions *(on page 529)* in any type of file so that you can return to it later.
- **Convert Hexadecimal Characters** - You can convert a sequence of hexadecimal characters to the corresponding Unicode character *(on page 579)*.
- **Encoding/Decoding Actions** - Contextual menu actions are available to encode or decode Base 64, Base 32, and Hex schemes *(on page 579)*.
- **Code Templates** - You can define your own code templates *(on page 546)* for any type of file and use the *Content Completion Assistant (on page 3418)* to invoke them.
- **Syntax Highlighting** - Non-XML files also support syntax highlighting with dedicated coloring schemes. To customize them, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to

Editor > Syntax Highlight *(on page 233)*. Select and expand the appropriate section in the top pane for the type of file you are editing and you can see the effects of your changes in the **Preview** pane.

- **Find/Replace** - You can use the **Find/Replace** action *(on page 442)* to find or replace all the occurrences of a word or string of characters in any type of file that you are editing.
- **File Comparison Tool** - The **Compare Files** tool *(on page 484)* can also be used to compare non-XML files.

Using Projects to Group Documents

Oxygen XML Editor includes a **Project** view *(on page 413)* that helps you organize your projects. Oxygen XML Editor offers a variety of helpful features for working with projects and makes it easy to share your projects with other members of your team. This section presents various unique features that will help you to create and work with projects.

Tip:
There are several sample project templates available for DITA users that can be used as a starting point or for inspiration. These sample project templates are found in the **Framework templates > DITA** folder in the **New Project** wizard: *(on page 410)*

- **Sample DITA Project** - This is a basic DITA project meant to help new users see how a DITA project is structured.
- **Startup DITA Project** - This is a startup DITA project that imposes a custom set of options (e.g. spell check settings and custom dictionaries), a custom DITA framework extension (e.g. custom new file templates. custom actions, custom CSS used for visual editing) and a folder structure for a DITA project according to best practices. Once created, the project contains a `Readme.html` file that explains all customizations and their benefits. If you plan to start your own DITA project using a version control system (such as Git), you can use this startup DITA project template to customize various aspects of DITA editing and share them with your team.

Creating a New Project

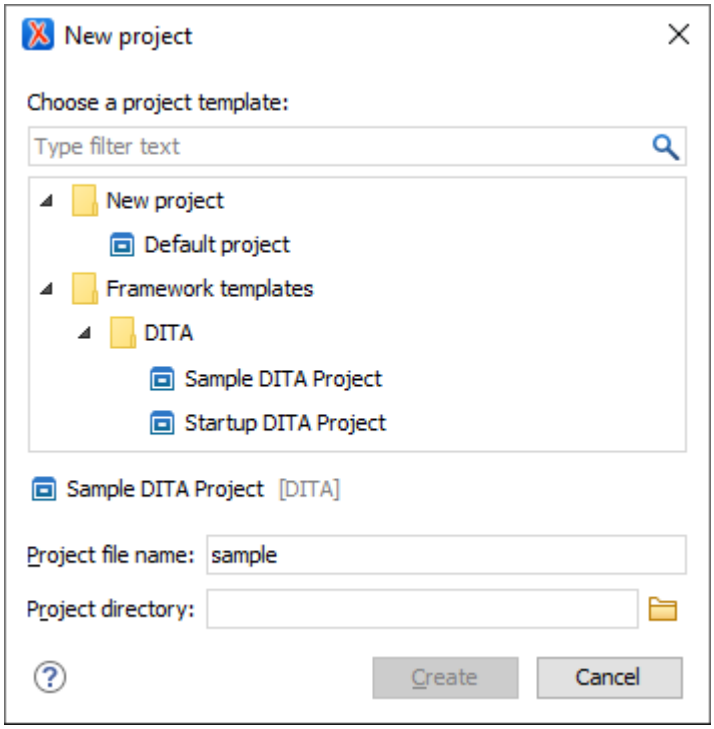
Oxygen XML Editor allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. You can also share your project settings and transformation/validation scenarios *(on page 425)* with other users. Use the **Project** view *(on page 413)* to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select **New Project** from the **Project** menu, the **New** menu in the contextual menu, or the drop-down menu at the top-left of the **Project** view.

This opens a new project wizard:

Figure 70. New Project Wizard



Tip:
There are several sample project templates available for DITA users that can be used as a starting point or for inspiration. These sample project templates are found in the **Framework templates > DITA** folder in the **New Project** wizard: *(on page 410)*

- **Sample DITA Project** - This is a basic DITA project meant to help new users see how a DITA project is structured.
- **Startup DITA Project** - This is a startup DITA project that imposes a custom set of options (e.g. spell check settings and custom dictionaries), a custom DITA framework extension (e.g. custom new file templates. custom actions, custom CSS used for visual editing) and a folder structure for a DITA project according to best practices. Once created, the project contains a `Readme.html` file that explains all customizations and their benefits. If you plan to start your own DITA project using a version control system (such as Git), you can use this startup DITA project template to customize various aspects of DITA editing and share them with your team.

With the exception of the *Default project* template, which is a pseudo-template and does not exist on the local disk (it is used only to create a new `.xpr` file), project templates are actually ZIP archives (with a `.zxpr` extension) and are stored within the file template directory structure (for example, `frameworks\dita\templates\sample-project\Sample DITA Project.zxpr`).

Tip:
Archives with a `.zxpr` extension can be edited in the **Archive Browser** view *(on page 2126)*.

After selecting a project template, you can specify the following:

Project file name

Specifies the name of the new project file. Oxygen XML Editor provides a default proposal for the file name based on the following rules:

- If there is an `.xpr` file inside the archive, its name is used.
- Otherwise, the name of the template is used.

Project directory

Specifies the directory where the archive content will be extracted.

> **Note:**
> The archive should not contain an extra single folder as the root. For the **Project directory** path to work properly, the archive must have the `.xpr` file on the first level, along with the other resources (files and folders).

Once you are done, click the **Create** button to begin the creation process. Oxygen XML Editor extracts the content from the archive inside the path specified in the **Project directory** field.

Editor Variables in Project Templates

By default, the editor variables inside project resources created from a project template are not resolved. To start having them resolved, the project template must be customized *(on page 387)* by using the `expandEditorVariablesIncludeFilter` property. This filter determines the resources where the editor variables will be resolved. If you need to exclude a subset of resources from the set specified by the `expandEditorVariablesIncludeFilter` property, the `expandEditorVariablesExcludeFilter` property can be used.

> **Note:**
> Usually, project files (`*.xpr`), framework files (`*.framework`), and framework extension scripts (`*.exf`) should be excluded from the editor variable resolving process.

The values of the inclusion and exclusion filters can be file paths relative to the project directory that can use wildcards or simply wildcards. Each filter can have multiple values, separated by spaces.

Possible filter values:

- `./*` - Matches all resources from the first level in the project directory.
- `*` or `./**` - Matches all resources on all levels inside the project directory.
- `dir1/dir2/*.dita` - Matches all `.dita` files from `[PROJECT_DIR]/dir1/dir2`, but not from subdirectories of `dir2`.
- `dir1/dir2/**/*.dita` - Matches all `.dita` files from `[PROJECT_DIR]/dir1/dir2`, including those from subdirectories of `dir2`.
- `dir1/**/*` - Matches all resources on all levels inside `[PROJECT_DIR]/dir1`.

- `dir1/article1.xml, dir2/article2.xml` - Matches only the two `.xml` files.
- `./**/*_suffix.md, ./**/prefix_*.html` - Matches all `.md` files with names that end with `_suffix` and all `.html` files with names that start with `prefix_`.

Adding Items to the Project

To add items to the project, select any of the following actions that are available when invoking the contextual menu in the **Project** view:

New > **File**

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

New > **Folder**

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

The project itself is considered a logical folder. You can add a logical folder, or content to a logical folder, by using one of the following actions that are available in the contextual menu, when invoked from the *project root*:

New > **Logical Folder**

Creates a logical folder in the tree structure (the icon is a magenta folder on macOS -).

New > Logical Folders from Web

Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on macOS -).

Add Files

Adds links to files on the local file system.

Add Edited File

Adds a link to the currently edited file in the project.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the **Refresh (F5)** action from the project contextual menu and the **Project** view *(on page 413)* will display the existing files and subdirectories. If your files are scattered among several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (macOS Finder) to the project tree, or by selecting **Add Folder** in the contextual menu from the *project root*. Linked folders are displayed in the **Project** view *(on page 413)* with bold text. To create a file inside a linked folder, select the **New >** **File** action from the contextual menu. The linked files presented in the **Project** view *(on page 413)* are marked with a special icon.

Note:
Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see Project View *(on page 413)*.

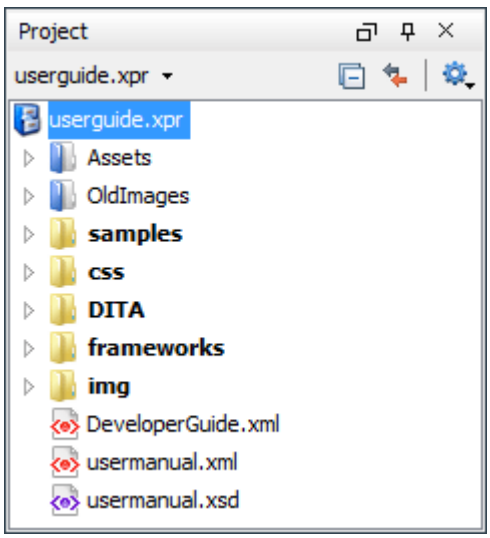
For more details about how you can share projects with other users, see Sharing a Project - Team Collaboration *(on page 425)*.

Related information
Using Projects to Group Documents *(on page 409)*

Project View

The **Project** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available in the contextual menu and on the toolbar associated to this panel allows you to create XML projects and provide shortcuts to various operations for the project documents.

Figure 71. Project View



By default, the view is positioned on the left side of Oxygen XML Editor, above the **Outline** view. If the view has been closed, it can be reopened at any time from the **Window > Show View** menu (or using the **Show Project View** action from the **Project** menu).

Project View Toolbar

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects and some actions to open a project or create a new one. You can use this history drop-down menu to quickly switch to a recently opened project. If you enable the **Remember layout changes for each project** option in the **Application Layout** preferences page *(on page 143)*, the application will remember the layout, open files, and editing location for your session when you switch projects.

The following actions are grouped in the upper right corner:

Collapse All

Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

Link with Editor

When selected, the currently edited file (from the main editor or from the DITA Maps Manager view) is highlighted in the project tree, if the file is found in the project.

> **Note:**
> This button is disabled automatically when you move to the **Debugger** *perspective (on page 3422)*.

Settings

A submenu that contains the following actions:

Filters

Allows you to filter the information displayed in the **Project** view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

Show Full Path

When selected, linked files and folders are presented with a full file path.

Enable Main Files Support

Select this option to enable the **Main Files** support *(on page 428)*.

Change Search and Refactor operations scope

Allows you to change the collection of documents that define the context of the search and refactor operations.

- **Use only Main Files, if enabled** - Restricts Oxygen XML Editor to perform the search and refactor operations starting from the *main files (on page 3421)* that are defined for the current resource. This option is available when you

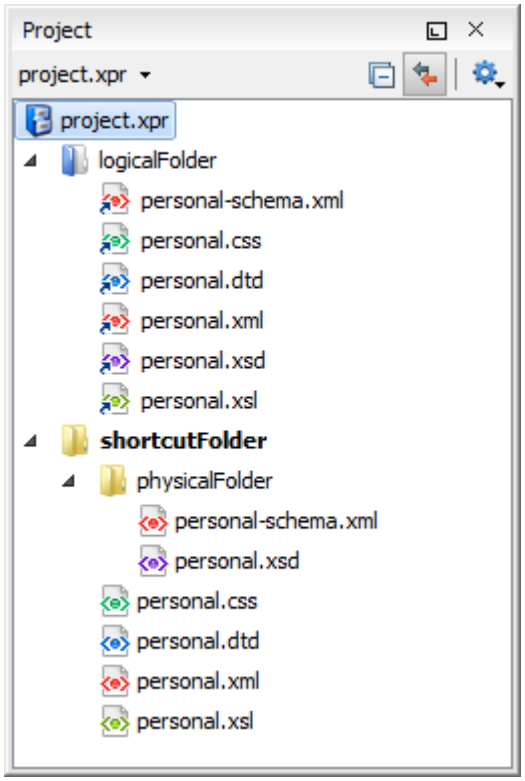
select **Project** in the **Select the scope for Search and Refactor operations** dialog box and the **Main Files** support is enabled.
- **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.

File Explorer Area

The rest of the view is basically a file explorer similar to most other commonly used file explorers. The XML project (`.xpr` file) is a logical container with a collection of resources (folders and files). The types of resources displayed include:

- **Logical folders with Linked folders/files** - Marked with a blue icon on Windows and Unix/Linux () and a magenta icon on macOS (), they help you group files within the project. This folder type is used as containers for linked resources (shortcuts). The icons for file shortcuts include a shortcut symbol () and names of folder shortcuts are displayed in bold text. The logical folders are created on the project root or inside other logical folders by using the contextual menu action **New > Logical Folder**, and the linked folders/files are added using **Add Files**, **Add Folder**, or by dragging and dropping files/folders from the view or the system file explorer.  **Remove from Project** can be used to remove them from the project and the  **Remove from Disk (Shift+Delete)** action can be used to remove them from both the project and the local file system.
- **Physical folders and files** - Marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on macOS). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**,  **Copy**, and  **Paste**) or by dragging and dropping files/folders from the view or the system file explorer. Also, the contextual menu action  **Remove from Disk (Shift+Delete)** can be used to remove them from the project and local file system.

Figure 72. Project View with Both Types of Resources



Creating New Projects

The following action is available from the **New** menu when right-clicking any item, the **Project** menu, or from the drop-down menu in the top-left of the **Project** view:

New Project

Opens a wizard that assists you with creating a new project. For more details, see Creating a New Project *(on page 409)*.

Managing Project Contents

There are various contextual menu actions, shortcuts, and ways to organize the folders and files inside the project:

Creating New Folders and Files

Right-click any item > New > File

Opens a **New** file wizard *(on page 377)* that helps you create a new file and adds it to the project structure.

Right-click any item in a physical folder > New > Folder

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

Right-click any item in a logical folder > New > Logical Folder

Creates a logical folder in the tree structure (the icon is a magenta folder on macOS).

Right-click on a logical folder > New > Logical Folders from Web

Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Adding Resources

You can add resources by using drag and drop (or **Copy** and **Paste**) actions from within the **Project** view or dragging them from the system file explorer. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Adding Resources to Logical Folders

You can add resources to logical folders by using the following actions available in the contextual menu when invoked on a logical folder (or the project's root container):

Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon for this action is different on macOS).

Add Files

Adds links to files on the local file system.

Add Edited File

Adds a link to the currently edited file in the project.

Removing Folders and Files

To remove logical folders or the linked resources inside them from the project, use **Remove from Project** from the contextual menu (or press **Delete** on your keyboard).

To remove folders or files from both the project and the local file system, use **Remove from Disk** from the contextual menu (or press **Shift+Delete** on your keyboard).

Moving Folders and Files

You can move the resources by using drag and drop actions from within the **Project** view (the **Enable drag-and-drop in Project view** option must be selected in the **View** preferences page *(on page 315)*).

You can also use the usual **Cut**, **Copy**, and **Paste** actions to move resources in the project.

You can also move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) or folders by using the **Refactoring > Move resource** action from the contextual menu. This action opens the **Move resource** dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope by using the button.

Renaming Folders and Files

There are several ways to rename a folder or file in the project (this works for both physical and linked resources):

- Select **Rename** from the contextual menu.
- Press **F2** on your keyboard.
- Select the item, then click the name, and type the new name.

You also can rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) or folders by using the **Refactoring > Rename resource** action from the contextual menu. This action opens the **Rename resource** dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can select or configure the scope by using the button.

Opening Files

There are several ways to open a file:

- Double-click the file.
- Select it and press **Enter** on your keyboard.
- Right-click the file and select **Open**.
- If there are no other files open in the editor area, you can drag the file from the project tree and drop it in the editor area.
- If you want to choose the application or location where to open it, you can right-click the file and select **Open with**.

Saving the Project

The project file is automatically saved every time the content of the **Project** view is saved or modified by actions such as adding or removing files and drag and drop.

Other Contextual Menu Actions

Numerous other actions are available in the contextual menu, depending on the type of file or folder where it is invoked from (some actions are available for multiple selected files):

Show in submenu

Explorer (Finder on macOS)

On Windows and macOS, the parent directory of the selected file or folder is presented in a specific Explorer/Finder window and the selected resource is highlighted. On Linux, the selected file or folder is not highlighted after opening its parent in the file explorer.

Terminal

Opens a console (terminal) at the location of the selected physical resource. If the resource is a file, it will start at the parent directory.

Copy Location

Copies an application-specific URL for the selected resource to the clipboard.

Refactoring submenu

Oxygen XML Editor includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** submenu:

Rename resource (Available for certain types of XML documents or folders)

Opens the **Rename resource** dialog box *(on page 423)* where you can change the name of a resource. It also includes an option to update the references to the renamed resource and you can choose between various scopes for the operation.

Move resource (Available for certain types of XML documents or folders)

Opens the **Move resource** dialog box *(on page 423)* where you can choose a destination and change the name of a resource. It also includes an option to update the references to the moved resource and you can choose between various scopes for the operation.

 **XML Refactoring**

Opens the **XML Refactoring** tool wizard *(on page 852)* that presents refactoring operations to assist you with managing the structure of your XML documents.

Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations *(on page 852)* that were finished or previewed will also appear in this submenu.

Show referenced resources

Opens the **Referenced/Dependent Resources** view *(on page 844)* that allows you to see the referenced resource hierarchy for an XML document.

Show dependent resources

Opens the **Referenced/Dependent Resources** view *(on page 844)* that allows you to see the resource dependencies for an XML document.

Refresh

Refreshes the content and the dependencies between the resources in the **Main Files** directory *(on page 428)*.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(on page 446)* that allows you to find and replace text in multiple files.

XPath in Files

Opens the **XPath/XQuery Builder** view *(on page 2120)* that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

Open/Find Resource

Opens the **Open/Find Resource** dialog box *(on page 436)*.

Check Spelling in Files

Allows you to check the spelling of multiple files *(on page 468)*.

Format and Indent Files

Opens the **Format and Indent Files** dialog box *(on page 571)* that allows you to configure the format and indent (*pretty-print (on page 3422)*) action that will be applied on the selected documents.

Open in SVN Client

Syncro SVN Client *(on page 2895)* tool is opened and it highlights the selected resource in its corresponding working copy.

Compare

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the **Compare Files** *(on page 484)* or **Compare Directories** *(on page 504)* tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the three-way comparison mode *(on page 487)*. If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

HTML to XML Well-formed (Available when selecting multiple resources)

Batch converts the selected HTML documents to be XML well-formed. This means that missing end tags will be added to applicable elements, unclosed tags will be properly closed, and quotes will be added to attribute values that were missing the quotes.

Notes:

- All selected HTML files are backed up before being processed (same path/name but with the ".bak" extension added at the end).
- Any detected conversion errors are grouped and listed in a dedicated tab in the **Results** pane at the bottom of the application.
- A brief report is displayed at the end of the operation.

Transform submenu

The currently selected files in the **Project** view can be transformed in one step with one of the following actions available from contextual menu in the **Transform** submenu:

Apply Transformation Scenario(s)

Obtains the output with one of the built-in scenarios.

Configure Transformation Scenario(s)

Opens a dialog box that allows you to configure pre-defined transformation scenarios.

Transform with

Allows you to select a transformation scenario to be applied to the currently selected files.

Validate submenu

The currently selected files in the **Project** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the **Validate** submenu:

Check Well-Formedness

Checks if the selected file or files are well-formed.

Validate

Validates the selected file or files against their associated schema. For EPUB files, this action triggers an **EPUB Validate and Check for Completeness** *(on page 2129)* operation.

Validate with Schema

Validates the selected file of files against a specified schema.

Configure Validation Scenario(s)

Allows you to configure and run a validation scenario.

Generate Documentation submenu

Generate Documentation > XML Schema Documentation

Opens the XML Schema Documentation dialog box *(on page 1024)*.

Generate Documentation > XSLT Stylesheet Documentation

Opens the XSLT Stylesheet Documentation dialog box *(on page 938)*.

Generate Documentation > XQuery Documentation

Opens the XQuery Documentation dialog box *(on page 1058)*.

Generate Documentation > WSDL Documentation

Opens the WSDL Documentation dialog box *(on page 1080)*.

Properties

Displays the properties of the current file in a **Properties** dialog box.

Enable Main Files Support (Available from the project container)

Allows you to enable the **Main Files Support** *(on page 429)* for each project.

Detect Main Files (Available from the project container when Main Files Support is enabled)

Opens the **Detect Main Files** wizard *(on page 430)* that enables the automatic detection of *main files*.

Add to Main Files (Available when Main Files Support is enabled)

Adds the selected files to the Main Files folder *(on page 431)*.

Project Menu Actions

The following actions are available in the **Project** menu:

New Project

Opens a wizard that assists you with creating a new project. For more details, see Creating a New Project *(on page 409)*.

Open Project (Ctrl + F2 (Command + F2 on macOS))

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the **Project** panel.

> **Notice:**
> When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Save Project As

Allows you to save the current project under a different name.

 **Validate all project files**

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

 **Filters**

Opens the **Project filters** dialog box that allows you to decide which files and directories will be shown or hidden.

Enable Main Files Support

Allows you to enable the **Main Files Support** *(on page 429)* for each project you are working on.

 **Change Search and Refactor operations scope**

Opens a dialog box that allows you to define the context of search and refactor operations.

Show Project View

Displays the **Project** view.

Reopen Project

Contains a list of links of previously used projects. This list can be emptied by invoking the **Clear history** action.

Moving/Renaming Resources in the Project View

The **Refactoring** submenu in the contextual menu of the **Project** view *(on page 413)* provides actions for moving or renaming certain types of XML resources in the current project while offering the option to update the references to the resources.

Moving Resources

You can move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Move resource** action from the contextual menu. This action opens the **Move resource** dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope by using the  button.

Renaming Resources

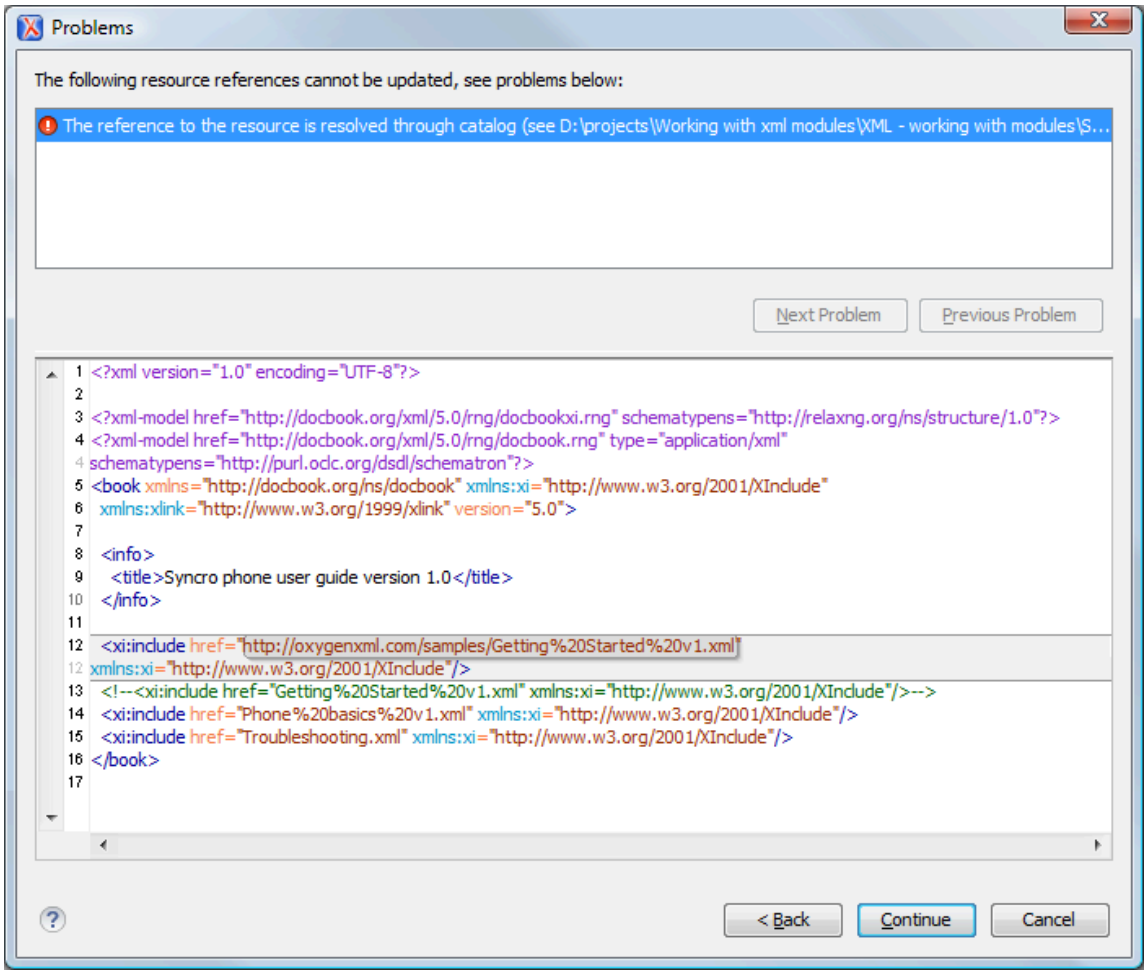
You can rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Rename resource** action from the contextual menu. This action opens the **Rename resource** dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can select or configure the scope by using the button.

Problems Updating References of Moved/Renamed Resources

In some cases, the references of a moved or a renamed resource cannot be updated. For example, when a resource is resolved through an *XML Catalog (on page 3425)* or when the path to the moved or renamed resource contains entities. For these cases, Oxygen XML Editor displays a warning dialog box.

Figure 73. Problems Dialog Box



Batch Validation and Transformation

Oxygen XML Editor provides support for batch validation and batch transformation. Actions are available in the **Project** view that provide the ability to validate or transform one or more files attached to a project.

Batch Validation

To batch validate files, select the files (or directories), right-click, and choose one of the following actions from the **Validate** submenu:

Check Well-Formedness

Checks if the selected file or files are well-formed.

Validate

Validates the selected file or files against their associated schema. For EPUB files, this action triggers an **EPUB Validate and Check for Completeness** *(on page 2129)* operation.

Validate with Schema

Validates the selected file of files against a specified schema.

Configure Validation Scenario(s)

Allows you to configure and run a validation scenario.

Batch Transformation

To batch transform files, select the files (or directories), right-click, and choose one of the following actions from the **Transform** submenu:

Apply Transformation Scenario(s)

Obtains the output with one of the built-in scenarios.

Configure Transformation Scenario(s)

Opens a dialog box that allows you to configure pre-defined transformation scenarios.

Transform with

Allows you to select a transformation scenario to be applied to the currently selected files.

Quick Validation and Transformation for Main Files *(on page 432)*

Sharing a Project - Team Collaboration

You can use XML projects to make team collaboration and synergy efficient and effective. Not only can you share the project files and folders, but Oxygen XML Editor also allows you to store preferences, transformation scenarios, and validation scenarios at project level *(on page 3423)* in a *project file* (`.xpr` file extension). It can be saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, so that your team has access to the same resources stored in the project file.

Sharing Preferences (Creating a Project-Level Options File)

To share options that are configured in certain preferences pages, you can store them in a *project file* (`.xpr` file extension) that can easily be shared with others. To do so, follow these steps:

1. [Recommended] You may want to use a fresh install for this procedure to ensure that you do not copy personal or local preferences.
2. In the **Project** view *(on page 413)*, create a project or open an existing one.
3. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*.
4. Configure the options in each preferences page that you want to be included in the project file and switch the storage preference to **Project Options** *(on page 3423)* in each page.

   > **Note:**
   > Some pages do not have the **Project Options** button, since the options they host might contain sensitive data (such as passwords, for example) that is unsuitable for sharing with other users.

5. Click **OK** and close the **Preferences** dialog box.

   All explicitly set values are now saved in the project file. You can then share the project file so that your team will have the same option configuration that you stored in the project file.

   > **Note:**
   > The project file extension (`.xpr`) must be preserved when the file is distributed to others.

   > **Notice:**
   > When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Sharing Transformation Scenarios

To share created and edited transformation scenarios, you can store them in a *project file* (`.xpr` file extension) by following these steps:

1. In the **Project** view *(on page 413)*, create a project or open an existing one.
2. When you create a new transformation scenario *(on page 1504)* or edit an existing one *(on page 1597)*, there is a **Storage** option. Switch the storage preference to **Project Options** *(on page 3423)* in each transformation scenario you want to be included in the project file.
3. Click **OK** to store the scenario in the project file.

   You can then share the project file so that your team will have access to the same transformation scenarios that you stored in the project file. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Note:
The project file extension (`.xpr`) must be preserved when the file is distributed to others.

Notice:
When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Sharing Validation Scenarios

To share created and edited validation scenarios, you can store them in a *project file* (`.xpr` file extension) by following these steps:

1. In the **Project** view *(on page 413)*, create a project or open an existing one.
2. When you create a new validation scenario or edit an existing one, there is a **Storage** option. Switch the storage preference to **Project Options** *(on page 3423)* in each validation scenario you want to be included in the project file.
3. Click **OK** to store the scenario in the project file.

   You can then share the project file so that your team will have access to the same validation scenarios that you stored in the project file. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Note:
The project file extension (`.xpr`) must be preserved when the file is distributed to others.

Notice:
When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Using Git for Collaboration

To assist you with team collaboration, sharing projects, and version control, an add-on is available that contributes a built-in Git client directly in Oxygen XML Editor. The **Git Client** is developed independent of the normal **Oxygen** release cycle, so it is updated and improved more frequently than the main application. It is an optional tool so it needs to be installed as an add-on. Once installed, a **Git Staging** view is available that includes various actions that perform common Git commands, such as *push*, *pull*, *change branch*, *commit*, and more. It also includes a built-in tool for comparing and merging changes.

For more details, see Git Client Add-on *(on page 2636)*.

Using Subversion (SVN) for Collaboration

Oxygen XML Editor also includes an embedded SVN (Subversion) Client. Even if you start developing a new project, or you want to migrate an existing one to Subversion, the Syncro SVN Client allows you to easily share it with the rest of your team. It can be accessed from the **Tools** menu and can be used for synchronizing your working copy with a central repository. It can also be started by selecting the  **Open in SVN Client** action from the contextual menu of the **Project** view *(on page 413)*. This action opens the Syncro SVN Client and shows the selected project file in the **Working Copy** view.

Minimize Differences Between Versions Saved on Multiple Computers

The number of differences between versions of the same file saved by multiple content authors on multiple computers can be minimized by imposing the same set of formatting options when saving the file, for all the content authors. An example, the following procedure can be used to minimize the differences:

1. Create an Oxygen XML Editor project file (`.xpr`) that will be shared by all content authors.
2. Configure your own formatting preferences. To do this, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Editor > Format**, configure the appropriate options in this page, then go to **Editor > Format > XML** and configure the options there.
3. Save the configured options into your project file by selecting **Project Options** *(on page 3423)* in both of the preferences pages.
4. Save the project and commit the project file to your versioning system so all the content authors can use it.
5. Make sure the project is opened in the **Project** view *(on page 413)*.
6. Open and save your XML files in the **Author** mode.
7. Commit the saved XML files to your versioning system.

When other content authors change the files, only the changed lines will be displayed in your diff tool instead of one big change that does not allow you to see the changes between two versions of the file.

Contextual Project Operations Using 'Main Files' Support

Oxygen XML Editor allows you to define *Main Files (on page 3421)* at project level. These *main files* are automatically used by Oxygen XML Editor to determine the context for operations such as validation, transformation, content completion, refactoring, or searches for XML, XSD, XSL, WSDL, and RNG modules. Oxygen XML Editor maintains the hierarchy of the *main files*, helping you to determine the editing context.

Oxygen XML Editor also provides unique support for using the *Main Files* support in DITA projects. In DITA, when you rename or move non-DITA resources, it allows you to update all the references to these resources

in the scope of the *Main Files* (in this case the *main DITA map (root map) (on page 3424)*). For more information, see Main Files Support in DITA *(on page 3368)*.

Main Files Benefits

Using the *Main Files* support in Oxygen XML Editor includes the following benefits:

- When the *main file* is validated, Oxygen XML Editor automatically identifies the modules included in the *main file* and validates all of them.
- When the *main file* is transformed, Oxygen XML Editor automatically identifies the modules included in the *main file* and transforms them accordingly.
- The *Content Completion Assistant (on page 3418)* presents all the components that are collected from the *main files* for the modules they include.
- The **Outline** view *(on page 549)* displays all the components that are defined in the *main files* hierarchy.
- The *main files* that are defined for the current module determines the scope of the search and refactoring actions *(on page 843)*. Oxygen XML Editor performs the search and refactoring actions in the context that the *main files* determine, thus improving the speed of execution.

Enabling the Main Files Support

Oxygen XML Editor stores the *main files* in a folder located in the **Project** view *(on page 413)*, as the first child of the project root. The *Main Files Support* is disabled by default and Oxygen XML Editor allows you to enable or disable the *Main Files Support* for each project you are working on.

To enable *Main Files* support, do one of the following:

- Select **Enable Main Files Support** from the **Settings** menu in the top-right corner of the **Project** view *(on page 413)*.
- Select **Enable Main Files Support** from the contextual menu of the project root folder in the **Project** view *(on page 413)*. If a disabled *Main Files* folder exists, you can also select that option from its contextual menu.
- Click the **Enable** button in the tooltip located at the bottom of the **Project** view *(on page 413)*. This tooltip window is displayed when the *Main Files* support is disabled. Clicking the **Read more** link takes you to the user guide. Clicking the **Enable** button opens the **Enable Main Files** dialog box. This dialog box contains general information about the **Main Files Support** and allows you to enable it. You can also use the **Detect and Enable** button in this dialog box to detect the *main files* from the current project.

  Warning:
  Once you close this window tip, Oxygen XML Editor hides it for all projects. You can make the window tip reappear by resetting Oxygen XML Editor to its default settings *(on page 323)*. However, doing so will result in you losing your customized options.

Related information
Detecting Main Files *(on page 430)*
Adding or Removing Files/Folders in the Main Files Directory *(on page 431)*

Detecting Main Files

Oxygen XML Editor allows you to detect the *main files* using the **Detect Main Files** option. This action applies to the folders you select in the project.

To detect *main files* over the entire project, do one of the following:

- Right-click the root of the project and select **Detect Main Files**.
- Use the **Detect Main Files from Project** option, available in the contextual menu of the `Main Files` folder.

Both of these options display the **Detect Main Files** wizard. In the first panel you can select the type of *main files* you want Oxygen XML Editor to detect. In the subsequent panel the detected *main files* are presented in a tree-like fashion.The resources are grouped into three categories:

- **Possible *main files*** - The files presented on the first level in this category are not imported or included from other files. These files are most likely to be set as *main files*.

  Note:
  For DITA projects, only *DITA Maps (on page 3419)* are reported as possible *main files*.

- **Cycles** - The files that are presented on the first level have circular dependencies between them. Any file presented on the first level of a cycle is a possible *main file*.
- **Standalone** - Files that do not include or import other files and are also not included or imported themselves. It is not necessary to set them as *main files*.

To set them as *main files*, simply select their checkboxes. Oxygen XML Editor marks all the children of a *main file* as modules. Modules are rendered in gray and their tool-tip presents a list of their *main files*. A module can be accessed from multiple *main files*.

The next panel displays a list with the selected *main files*. Click the **Finish** button to add the *main files* in the `Main Files` folder.

You can use the **Select Main Files** option to automatically mark all *main files*. This action sets all the resources from the **Possible Main Files** category and the first resource of each **Cycle** as *main files*. The **Deselect All** button simply removes all of your selections.

Tip:
It is recommended that you only add top-level files (files that are at the root of the include/import graph) in the `Main Files` directory.

Attention:
If the **Main Files Support** is disabled, the `Main Files` directory is rendered only if it contains *main files*.

Enabling the Main Files Support *(on page 429)*
Adding or Removing Files/Folders in the Main Files Directory *(on page 431)*

Adding or Removing Files/Folders in the Main Files Directory

Adding Files/Folders to the Main File Directory

The `Main Files` directory can contain logical folders, linked folders, or linked files.

To add files in the `Main Files` directory, use one of the following methods:

- Right-click a file from your project and select **Add to Main Files** from the contextual menu.
- Select **Add Files** or **Add Edited File** from the contextual menu of the `Main Files` directory.
- Drag and drop files into the `Main Files` directory.
- From the contextual menu of the **Referenced/Dependent Resources** view *(on page 844)*, use the **Add to Main Files** action.

To add folders in the `Main Files` directory, use one of the following methods:

- Right-click `Main Files` directory and select **Add Folder** from the contextual menu.
- Drag and drop folders into the `Main Files` directory.

You can view the *main files* for the current resource by selecting **Properties** from the contextual menu *(on page 422)* of the **Project** view *(on page 413)* and the *main files* for the current editor in the **Properties** *(on page 407)* and **Information** *(on page 522)* views.

Removing Files/Folders from the Main Files Directory

The main files that are already defined in the project are automatically marked in the tree. To disable a main file or folder, remove it from the `Main Files` folder (for example, right-click and select **Remove from Main Files**). Removing files or folders from the `Main Files` folder does NOT delete the files from disk. It just removes the logical files from that logical folder in the project.

Enabling the Main Files Support *(on page 429)*

Detecting Main Files *(on page 430)*

Quick Validation and Transformation for Main Files

If *Main Files Support* is enabled *(on page 429)*, you can hover the cursor over the Main Files directory, or a node within the directory, and Oxygen XML Editor will display inline **Validate** and **Transform** buttons that can be used to quickly run a validation or transformation over the directory or node. For nodes within the Main Files directory, hovering over the **Validate** and **Transform** buttons also displays the most recently used validation or transformation scenario. To change the assigned validation or transformation scenario, right-click the node and select **Validate > Configure Validation Scenario(s)** or **Transform > Configure Transformation Scenario(s)**, respectively.

Search and Find/Replace Features

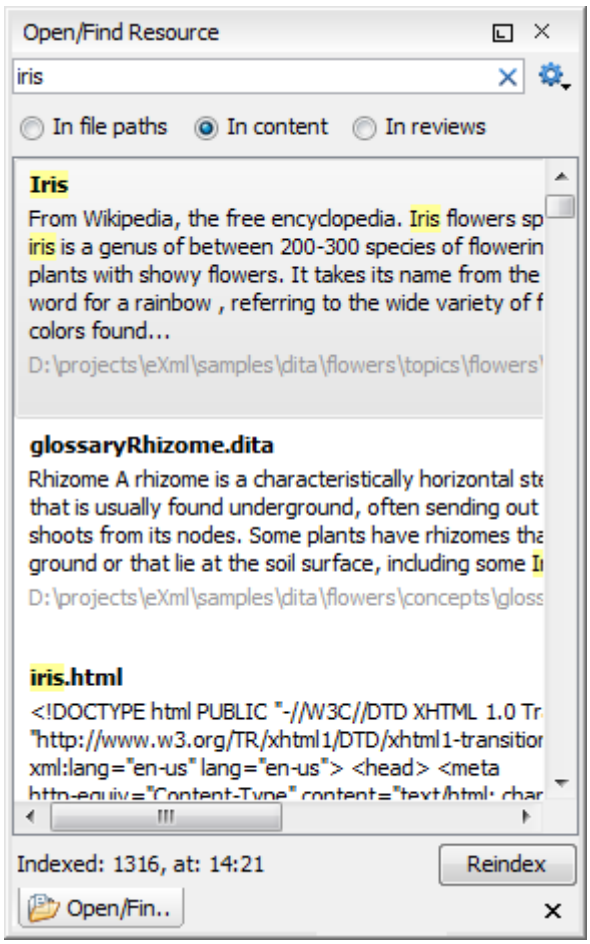
Oxygen XML Editor includes advanced search capabilities to help you locate documents and resources. The search features are powered by Apache Lucene. Apache Lucene is a free open source information retrieval software library. You can perform simple text searches or more complex searches using the Apache Lucene - Query Parser Syntax.

Note:
When Oxygen XML Editor performs the indexing of resources, referenced content is not taken into account. For example, when DITA documents are indexed, the content referenced in a `@conref` or `@conkeyref` attribute is not parsed. The files that make up the index are stored on disk in the `[user_home_directory]\AppData\Roaming\com.oxygenxml\lucene` folder.

Open/Find Resource View

The **Open/Find Resource** view is designed to offer advanced search capabilities either by using a simple text search or by using the Apache Lucene - Query Parser Syntax. By default, the view is presented in the left side of the Oxygen XML Editor layout, next to the **Project** view *(on page 413)* or **DITA Maps Manager** *(on page 3073)*. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 74. Open/Find Resource View



You can use this view to find a file in the current Oxygen XML Editor project or in one of the *DITA maps (on page 3419)* opened in the **DITA Maps Manager** view *(on page 3073)* by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The **Open/Find Resource** view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content) by selecting the **In reviews** option *(on page 434)*.

Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the **Results** view *(on page 558)* view at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on macOS)** or **Ctrl + UpArrow (Command + UpArrow on macOS)** on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

Note:
Searches are not case-sensitive. For example, if you search for `car` you get the same results as when you search for `Car`.

Tip:
Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for `*ing` with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for `*/samples/*.gif` with the **in file paths** option selected, you will find all the *gif* images from the `samples` directory.

Options Available in the View

The **Open/Find Resource** view offers the following options:

- **Settings** - Drop-down menu that includes the following settings for the view:
  - **Clear Index** - Clears the index.
  - **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.
  - **Options** - Opens the **Open/Find Resource** preferences page *(on page 307)* where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.
- **In file paths** *(on page 441)* - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** *(on page 439)* - Select this option to search through the content of your resources.
- **In reviews** *(on page 441)* - Select this option to search through the comments, *tracked change* insertions/deletions, or highlights in your resources.
- **Reindex** - Use this option to reindex your resources.

Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Editor internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called **stop words**): *a*, *an*, *and*, *are*, *as*, *at*, *be*, *but*, *by*, *for*, *if*, *in*, *into*, *is*, *it*, *no*, *not*, *of*, *on*, *or*, *such*, *that*, *the*, *their*, *then*, *there*, *these*, *they*, *this*, *to*, *was*, *will*, *with*. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of **stop words** in the **Open/Find Resource** preferences page *(on page 307)*.

Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you click the **Reindex** button.

Important:
Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Editor project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

Opening the Results

Once you find the files that you want to open, select them in the list and click the **Open** button (or double-click them). Each of the selected files is opened in the editor associated with the type of the file *(on page 306)*.

Note:
You can drag a resource from the **Open/Find Resource** view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

Resources

For more information about the **Open/Find Resource** feature and its search capabilities, watch our video demonstration:

https://www.youtube.com/embed/PENoDNdaGao

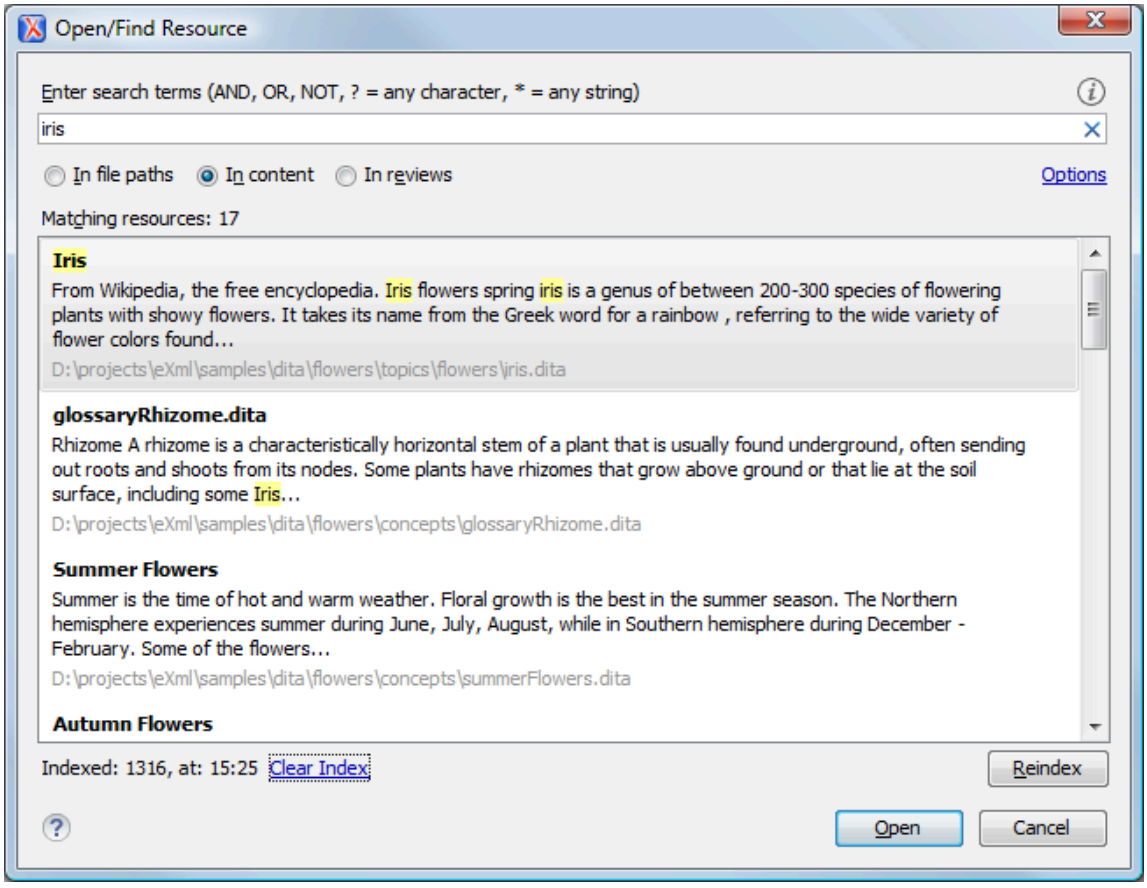
Related information

Open/Find Resource Dialog Box *(on page 436)*

Open/Find Resource Dialog Box

The **Open/Find Resource** dialog box offers advanced search capabilities. To open the dialog box, go to **Find > Open/Find Resource (Ctrl + Shift + R (Command + Shift + R on macOS))**. You can also click the **Open/Find Resource** toolbar button or use the **Search for file** action that is available in some URL input fields.

Figure 75. Open/Find Resource Dialog Box



You can use this dialog box to find a file in the current Oxygen XML Editor project or in one of the *DITA maps (on page 3419)* opened in the **DITA Maps Manager** view *(on page 3073)* by typing a few letters of the file name or a fragment of the content you are searching for. The **Open/Find Resource** dialog box also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the **Results** view *(on page 558)* view at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on macOS)** or **Ctrl + UpArrow (Command + UpArrow on macOS)** on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

Note:
Searches are not case-sensitive. For example, if you search for `car` you get the same results as when you search for `Car`.

Tip:
Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for `*ing` with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for `*/samples/*.gif` with the **in file paths** option selected, you will find all the *gif* images from the `samples` directory.

Options Available in the Dialog Box

The **Open/Find Resource** dialog box includes the following options:

- **In file paths** *(on page 441)* - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** *(on page 439)* - Select this option to search through the content of your resources.
- **In reviews** *(on page 441)* - Select this option to search through the comments, *tracked change* insertions/deletions, or highlights in your resources.
- **Options** - Opens the **Open/Find Resource** preferences page *(on page 307)* where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.
- **Clear Index** - Clears the index.
- **Reindex** - Use this option to reindex your resources.

Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Editor internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.

- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called **stop words**): *a*, *an*, *and*, *are*, *as*, *at*, *be*, *but*, *by*, *for*, *if*, *in*, *into*, *is*, *it*, *no*, *not*, *of*, *on*, *or*, *such*, *that*, *the*, *their*, *then*, *there*, *these*, *they*, *this*, *to*, *was*, *will*, *with*. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of **stop words** in the **Open/Find Resource** preferences page *(on page 307)*.

Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you click the **Reindex** button.

Important:
Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Editor project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

Opening the Results

Once you find the files that you want to open, select them in the list and click the **Open** button (or double-click them). Each of the selected files is opened in the editor associated with the type of the file *(on page 306)*.

Resources

For more information about the **Open/Find Resource** feature and its search capabilities, watch our video demonstration:

https://www.youtube.com/embed/PENoDNdaGao

Related information

Open/Find Resource View *(on page 433)*

Open/Find Resource Preferences Page *(on page 307)*

Searching in Content

To perform a search through the content of your resources, open the **Open/Find Resource** dialog box *(on page 436)* (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on macOS)**) or the **Open/Find Resource** view *(on page 433)* (by default, located on the left side of the editor), select the **in content** option, and in the search field enter the terms that you want to search for.

The **Open/Find Resource** feature is powered by Apache Lucene. Apache Lucene is a free open source information retrieval software library.

You can use the **Open/Find Resource** feature to either perform a simple text search or a more complex search using the Apache Lucene - Query Parser Syntax.

Complex Query Patterns Using Lucene Syntax

Using the Apache Lucene - Query Parser Syntax means you can perform any of the following searches:

- **Term Searches**

  Searching for plain text:

  ```
  Garden Preparation
  ```

- **Element-Specific Searches**

  Searching for content that belongs to a specific element:

  ```
  title:"Garden Preparation"
  ```

- **Wildcard Searches**

  Using wildcards to make your search more permissive:

  ```
  Garden Prepar?tion
  ```

- **Fuzzy Searches**

  If you are not sure of the exact form of a term that you are interested in, use the fuzzy search to find the terms that are similar to the search term. To perform a fuzzy search, use the `~` symbol after the word that you are not sure of:

  ```
  Garden Preparing~
  ```

- **Proximity Searches**

Use proximity searches to find words that are within a specific distance away. To perform a proximity search, use the `~` symbol at the end of your search. For example, to search for the word **Garden** and the word **Preparation** within 6 words of each other use:

```
"Garden Preparation"~6
```

- **Range Searches**

  Use range searches to match documents whose element values are between the lower and upper bound specified in the range query. For example, to find all documents whose titles are between **Iris** and **Lilac**, use:

  ```
  title:{Iris TO Lilac}
  ```

  The curly brackets denote an exclusive query. The results you get when using this query are all the documents whose titles are between **Iris** and **Lilac**, but not including **Iris** and **Lilac**. To create an inclusive query use square brackets:

  ```
  title:[Iris to Lilac]
  ```

- **Term Boosting Searches**

  Use term prioritising searches if the fragment of text that you are searching for contains certain words that are more important to your search than the rest of them. For example, if you are searching for **Autumn Flower**, a good idea is to prioritize the word **Autumn** since the word **Flower** occurs more often. To prioritize a word use the `^` symbol:

  ```
  Autumn^6 Flower
  ```

- **Searches Using Boolean Operators**

  You can use the **AND**, **+**, **OR**, **-**, and **NOT** operators.

  To search for documents that contain both the words **Garden** and **Preparation**, use:

  ```
  Garden AND Preparation
  ```

  To search for documents that must contain the word **Garden** and may contain the word **Preparation**, use:

  ```
  +Garden Preparation
  ```

  To search for documents that contain either the word **Garden** or the word **Preparation**, use:

  ```
  Garden OR Preparation
  ```

  To search for documents that contain **Garden Preparation** but not **Preparation of the Flowers**, use:

  ```
  "Garden Preparation" - "Preparation of the Flowers"
  ```

- **Searches Using Grouping**

To search either for the word **Garden** or **Preparation**, and the word **Flowers**, use:

```
(Garden OR Preparation) AND Flowers
```

- **Searches Using Element Grouping**

  To search for a title that contains both the word **Flowers** and the phrase **Garden Preparation**, use:

  ```
  title:(+Flowers +"Garden Preparation")
  ```

- **Searching for Special Characters**

  Sometimes you might need to search your content for special character, such as:

  ```
  + - && || ! ( ) { } [ ] ^ ~ * ? : \
  ```

  In this case, you should surround your search query with quotes. For example, to search for **(Hydrogen + Oxygen)=Water**, use:

  ```
  "(Hydrogen + Oxygen)=Water"
  ```

Searching in File Paths

To perform a search in the file paths of your resources, open the **Open/Find Resource** dialog box *(on page 436)* (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on macOS)**) or the **Open/Find Resource** view *(on page 433)* (by default, located on the left side of the editor), select the **In file paths** option, and in the search field enter the terms that you want to search for.

The **Open/Find Resource** feature allows you to search for a resource either by its name or by its path (or by a fragment of its path).

You can use wildcards when you perform such searches:

- Use "*" to match any sequence of characters.
- Use "?" to match any single character.

For example, if you search for ***-preferences-page** you will find all the resources that contain the *-preferences-page* fragment in their name. If you search for ***/samples/*.gif**, you will find all the `.gif` images from the `samples` directory.

Searching in Reviews

To perform a search in the edits of your resources, open the **Open/Find Resource** dialog box *(on page 436)* (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on macOS)**) or the **Open/Find Resource** view *(on page 433)* (by default, located on the left side of the editor), select the **In reviews** option, and in the search field enter the terms that you want to search for.

The following options are available:

- **Type** - Specifies whether you want to search for content in comments, tracked change insertions/deletions, or highlighted content.
- **Author** - Displays all the authors of the edits in your resources. The authors are collected when indexing. You can set a specific author for your search or search all of them.
- **Time**- Specifies the time when the edits that you are searching through were created.

Both the view and the dialog box display the edits that contain the search results and their parent topics along with a short description. To hide this description, go to **Settings** and deselect the **Show Description** option.

Find/Replace Dialog Box

To open the **Find/Replace** dialog box, use the  **Find/Replace** action that is available in the **Find** menu, on the toolbar, or by pressing **Ctrl + F (Command + F on macOS)**. It is also invoked by the **Find/Replace** contextual menu action found in certain views.

You can use the **Find/Replace** dialog box to perform the following operations:

- Replace occurrences of target defined in the **Find** area with a new fragment of text defined in **Replace with** area.
- Find all the occurrences of a word or string of characters (that can span over multiple lines) in the document you are editing. This operation also takes into account all the whitespaces contained in the fragment you are searching for. The **Find/Replace** dialog box counts the number of occurrences of the text you are searching for and displays it at the bottom of the dialog box, above the **Close** button. This number is also displayed in the **Results** view *(on page 558)* view after you click the **Find All** button.

The *find* operation works on multiple lines, meaning that a find match can cover characters on multiple lines of text. To input multiple-line text in the **Find** and **Replace with** areas, do one of the following:

- Press **Ctrl + Enter (Command + Enter on macOS)** on your keyboard.
- Use the **Insert newline** contextual menu action.

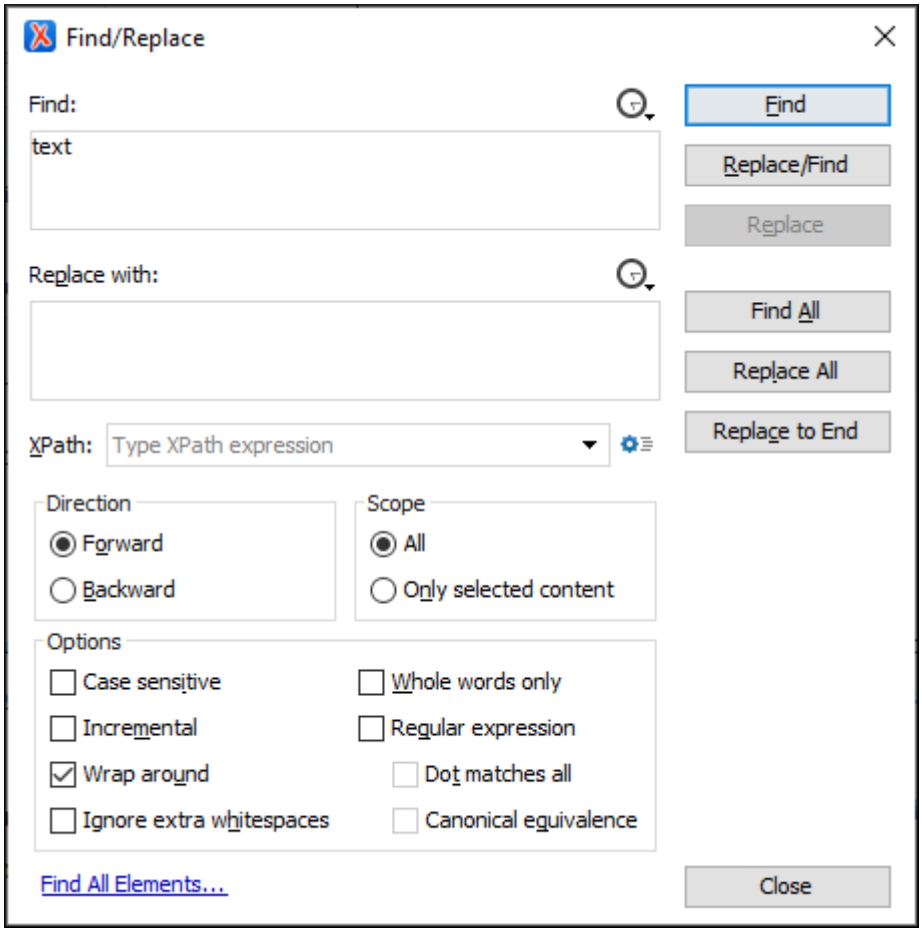
You can use Perl-like regular expressions syntax *(on page 457)* to define patterns. A content completion assistance window is available in the **Find** and **Replace with** areas to help you edit regular expressions. It is activated every time you type ****(backslash key) or on-demand if you press **Ctrl + Space** on your keyboard.

The *replace* operation can bind regular expression capturing groups (`$1, $2`, etc.) from the find pattern.

Tip:
To replace the `<tag-name>` start tag and its attributes with the `<new-tag-name>` tag use as **Find** the expression *<tag-name(\s+)(.*)>* and as **Replace with** the expression *<new-tag-name$1$2>*.

Find/Replace Dialog Box

Figure 76. The Find/Replace Dialog Box



The **Find/Replace** dialog box contains the following options:

Find text area box

This is where you enter the character string to search for. You can search for Unicode characters specified in the `\uNNNN` format. Also, hexadecimal notation (`\xNNNN`) and octal notation (`\0NNNN`) can be used. In this case you have to select the **Regular expression** option *(on page 445)*. For example, to search for a space character you can use the `\u0020` code.

You can use the **History** button to select from a list of the most recently used expressions. Use the **Clear history** action from the bottom of the lists to remove these expressions.

Replace with text area box

The character string with which to replace the target. The string for replace can be on a line or on multiple lines. It can contain Perl notation capturing groups, only if the search expression is a regular expression and the **Regular expression** option *(on page 445)* is selected.

> **Note:**
> Some regular expressions can indefinitely block the application. If the execution of the regular expression does not end in about 5 seconds, the application displays a dialog box that allows you to interrupt the operation.

> **Tip:**
> Special characters such as *newline* and *tab* can be inserted in the **Find** and **Replace with** text boxes using dedicated actions in the contextual menu (**Insert newline** and **Insert tab**).

Unicode characters in the `\uNNNN` format can also be used in the **Replace with** area.

You can use the **History** button to select from a list of the most recently used expressions. Use the **Clear history** action from the bottom of the lists to remove these expressions.

XPath

The XPath 2.0 expression you input in this combo is used for restricting the search scope. The cursor position does not affect the result of the XPath evaluation. The context of the XPath expression evaluation from the **Find/Replace** dialog box is the XML document root. The XPath is used for determining the intervals to be searched from the document, so the XPath result must be a node-set.

> **Tip:**
> You can use the *Content Completion Assistant (on page 3418)* to help you input XPath expressions that are valid in the current context. See *Working with XPath Expressions (on page 2117)* for more information and some common examples of how to write XPath expressions.

Clicking the **XPath Options** button opens a preferences page where you can configure some XPath-related options.

Direction

Specifies if the search direction is from current position to end of file (**Forward**) or to start of file (**Backward**).

Scope

Specifies whether the **Find/Replace** operation is executed over the entire content of the edited document (**All** option), or over the selected content/lines.

Options section

Case sensitive

When selected, the search operation follows the exact letter case of the text entered in the **Find** field.

Incremental

The search operation is started every time you type or delete a letter in the **Find** text box.

Wrap around

When the end of the document is reached, the search operation is continued from the start of the document, until its entire content is covered.

Ignore extra whitespaces

If selected, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces when performing the search operation. This is helpful when searching for spaced-separated words since line breaks and indentation between words will not affect the results. This option is automatically disabled if the **Regular expression** option is selected.

Whole words only

Only entire occurrences of a word are included in the search operation. This option is automatically disabled if the **Regular expression** option is selected.

Regular expression

When this option is selected, you can use regular expressions in Perl-like regular expressions syntax *(on page 457)* to look for specific pieces of text.

- **Dot matches all** - A dot used in a regular expression also matches end of line characters.
- **Canonical equivalence** - If selected, two characters will be considered a match if, and only if, their full *canonical (on page 3418)* decompositions match. For example, the **ã** symbol can be inserted as a single character or as two characters (the **a** character followed by the tilde **~** character). This option is not selected by default.

Find All Elements link

Available when editing in **Author** mode, you can use this link to extend the search scope to XML-specific markup (names and values of both attributes and elements).

Find button

Executes a find operation for the next occurrence of the target. It stops after highlighting the find match in the editor panel.

Replace/Find button

Executes a replace operation for the target followed by a find operation for the next occurrence.

Replace button

Executes a replace operation for the target without going to the next occurrence.

Find All button

Executes a find operation and displays all results in the **Results** view *(on page 558)* view.

Replace All button

Executes a replace operation in the entire scope of the document.

Replace to End button

Executes a replace operation starting from current target until the end of the document, in the direction specified by the current selection of the **Direction** switch (**Forward** or **Backward**).

Find/Replace in Multiple Files

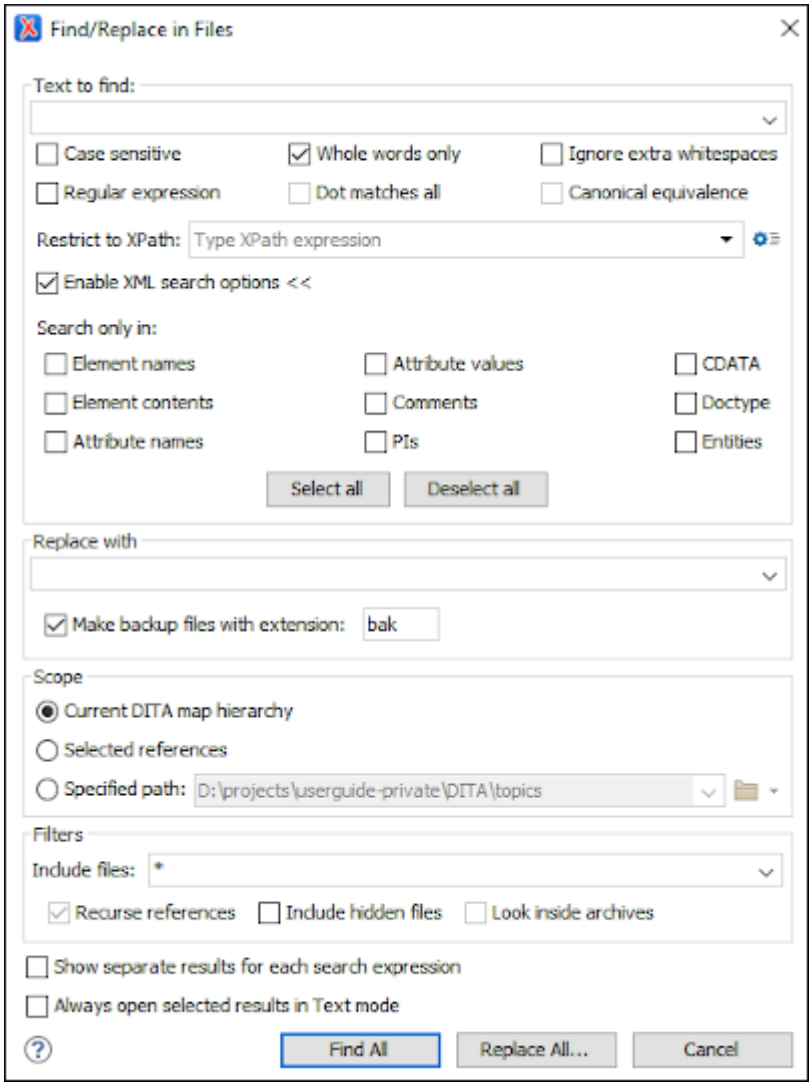
The **Find/Replace in Files** feature enables you to define *Search for* or *Search for and Replace* operations across multiple files (for example, in DITA projects you can search in the scope of an entire *DITA map (on page 3419)*). To open the **Find/Replace in Files** dialog box, use the  **Find/Replace in Files** action that is available in the following locations:

- The **Find** menu.
- The  **Find/Replace in Files** button on the main toolbar.
- The contextual menu of the **DITA Maps Manager** view *(on page 3073)*.
- The contextual menu of the **Project** view *(on page 413)*.
- The contextual menu of the **Data Source Explorer** view *(on page 2133)* for most types of database connections.

The operation works on both local and remote files from an (S)FTP, WebDAV, or CMS server.

Find/Replace in Files Dialog Box

Figure 77. Find / Replace in Files Dialog Box (When Opened from the Toolbar Button)



The dialog box contains the following options:

Text to Find section

The first text field is where you enter the character string to search for. You can search for Unicode characters specified in the `\uNNNN` format. Also, hexadecimal notation (`\xNNNN`) and octal notation (`\0NNNN`) can be used. In this case you have to select the **Regular expression** option. For example, to search for a space character you can use the `\u0020` code.

The rest of the options in this section can be used to refine your search:

Case sensitive

When selected, the search operation follows the exact letter case of the value entered in the **Text to find** field.

Whole words only

Only entire occurrences of a word are included in the search operation. This option is automatically disabled if either the **Ignore extra whitespaces** or **Regular expression** options are selected.

Ignore extra whitespaces

If selected, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces when performing the search operation. This is helpful when searching for spaced-separated words since line breaks and indentation between words will not affect the results. This option is automatically disabled if the **Regular expression** option is selected.

Regular expression

When this option is selected, you can use regular expressions in Perl-like regular expressions syntax *(on page 457)* to look for specific pieces of text.

- **Dot matches all** - A dot used in a regular expression also matches end of line characters.
- **Canonical equivalence** - If selected, two characters will be considered a match if, and only if, their full *canonical (on page 3418)* decompositions match. For example, the **ã** symbol can be inserted as a single character or as two characters (the **a** character followed by the tilde **~** character). This option is not selected by default.

Restrict to XPath

The XPath 2.0 expression you input in this combo is used for restricting the search scope. The XPath is used for determining the intervals to be searched from the document, so the XPath result must be a node-set.

Example: Use the XPath filter expression `//*[not(local-name() = 'uicontrol')]` to skip over the contents of any `<uicontrol>` element.

> **Tip:**
> You can use the *Content Completion Assistant (on page 3418)* to help you input XPath expressions that are valid in the current context. See Working with XPath Expressions *(on page 2117)* for more information and some common examples of how to write XPath expressions.

Clicking the **XPath Options** button opens a preferences page where you can configure some XPath-related options.

Enable XML search options

This option is only available when editing in **Text** mode. It provides access to a set of options that allow you to search specific XML component types:

- **Element names** - Only the element names are included in the search operation that ignores XML-tag notations ('<', '/', '>'), attributes or white-spaces.
- **Element contents** - Search in the text content of XML elements.
- **Attribute names** - Only the attribute names are included in the search operation, without the leading or trailing white-spaces.
- **Attribute values** - Only the attribute values are included in the search operation, without single quotes(') or double quotes(").
- **Comments** - Only the content of comments is included in the search operation, excluding the XML comment delimiters ('<!--', '-->').
- **PIs** (Processing Instructions) - Only the content is searched, skipping '<?'...'?>' (for example, `<?processing instruction?>`).
- **CDATA** - Searches inside content of CDATA sections.
- **DOCTYPE** - Searches inside content of DOCTYPE sections.
- **Entities** - Only the entity names are searched.

The two buttons **Select All** and **Deselect All** allow a simple activation and deactivation of all types of XML components.

Note:
Even if you select all options of the **Enable XML search options** section, the search is still XML-aware. If you want to perform the search over the entire file content, deselect **Enable XML search options**.

Replace with section

Use the text field in this section to specify a character string to replace the target with. It may contain regular expression group markers if the search expression is a regular expression and the **Regular expression** checkbox is selected.

Tip:
If you want to change the XML structure, you could use the built-in XML refactoring operations *(on page 856)*. You can even customize your own refactoring operations *(on page 868)*.

Make backup files with extension

In the replace process Oxygen XML Editor makes backup files of the modified files. The default extension is `.bak`, but you can change the extension as you prefer.

Scope section

The options available in this section depend on the context (how the dialog box was opened). Select one of the listed options to specify the scope for the operation. The possible options include:

Selected project resources

Searches only in the selected files.

Project files

Searches in all files from the current project.

All opened files

Searches in all files opened in Oxygen XML Editor (regular files or *DITA maps*). You are prompted to save all modified files before any operation is performed.

Current file directory

The search is done in the directory of the file opened in the current editor panel. If there is no open file, this option is not available.

Current DITA Map hierarchy (only available if opened from the DITA Maps Manager)

The search is done in all maps and topics referenced by the currently selected *DITA map*, opened in the **DITA Maps Manager** view *(on page 3073)*.

Selected references (only available if opened from the DITA Maps Manager)

Searches only in the selected DITA references.

Opened archive (only available if opened from the Archive Browser view)

The search is done in an archive opened in the Archive Browser *(on page 2126)* view.

Specified path

Use this option to specify the search path.

Filters section

The options available in this section depend on the context (how the dialog box was opened) and they can be used to filter the search operation. The possible options include:

Include files

Narrows the scope of the operation only to the files that match the given filters. For example, you can choose to filter the search to only include files with a certain file extension (such as `*.xml`).

Recurse subdirectories

When selected, the search is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.

Recurse references (only available if opened from the DITA Maps Manager)

When selected, the search is performed recursively for the selected scope.

Include hidden files

When selected, the search is also performed in the hidden files.

Include archives

When selected, the search is also done in all individual file entries from all supported ZIP-type archives.

Show separate results for each search expression

When selected, the application opens a new tab to display the result of each new search expression. When the option is unchecked, the search results are displayed in the *Find in Files* tab, replacing any previous search results.

Always open selected results in Text mode

If selected, double-clicking results will always open the documents in **Text** mode (even if the particular document type is set to open in **Author** mode, by default). If not selected (default state), double-clicking results will open the documents in whatever editing mode is specified as the default for that document type. For example, by default, DITA documents will open in **Author** mode (as specified in the default framework configuration for DITA document types). Specialized XML documents such as XSLT or XML Schema will continue being opened in the **Text** editing mode.

Find All

Use the **Find All** button to execute the search operation. The results are displayed in a view that allows grouping the results as a tree with two levels.

Replace All

Use the **Replace All** button to execute the search operation and replace all occurrences with the specified string. When you replace a fragment of text, Oxygen XML Editor offers an option to preview of the changes you make. The **Preview** dialog box is divided in two sections. The first section presents a list of all the documents containing the fragment of text you want to modify. The second section offers a view of the original file and a view of the final result. It also allows you to highlight all changes using the vertical bar from the right side of the view. The **Next change** and **Previous change** buttons allow you to navigate through the changes displayed in the **Preview** dialog box.

CAUTION:
Use the **Replace All** option with caution. Global searches may result in matching strings being replaced in instances that were not originally intended.

Note:

- You can use Perl-like regular expression syntax *(on page 457)* to match patterns in text content. The *replace* operation can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.
- Exclusion patterns are accepted. For example, `*.java, !*Test.java` would search for all files with a *.java* extension, with the exception of any file whose name ends in *Test*.
- To replace the `<tag-name>` start tag and its attributes with the `<new-tag-name>` tag use as **Text to find** the expression *<tag-name(\s+)(.*)>* and as **Replace with** the expression *<new-tag-name $1$2>*.
- The encoding used to read and write the files is detected from the XML header or from the BOM. If a file does not have an XML header or BOM Oxygen XML Editor uses by default the UTF-8 encoding for files of type XML, that is for files with one of the extensions: `.xml`, `.xsl`, `.fo`, `.xsd`, `.rng`, `.nvdl`, `.sch`, `.wsdl` or an extension associated with the XML editor type *(on page 306)*. For the other files it uses the encoding configured for non-XML files *(on page 175)*.
- You can cancel a long operation at any time by pressing the **Cancel** button of the progress dialog box, but doing so will not revert any replacements that have been processed up to that point.
- Since the content of read-only files cannot be modified, the **Replace** operation does not process those files. For every such file, a warning message is displayed in the message panel.

Related information

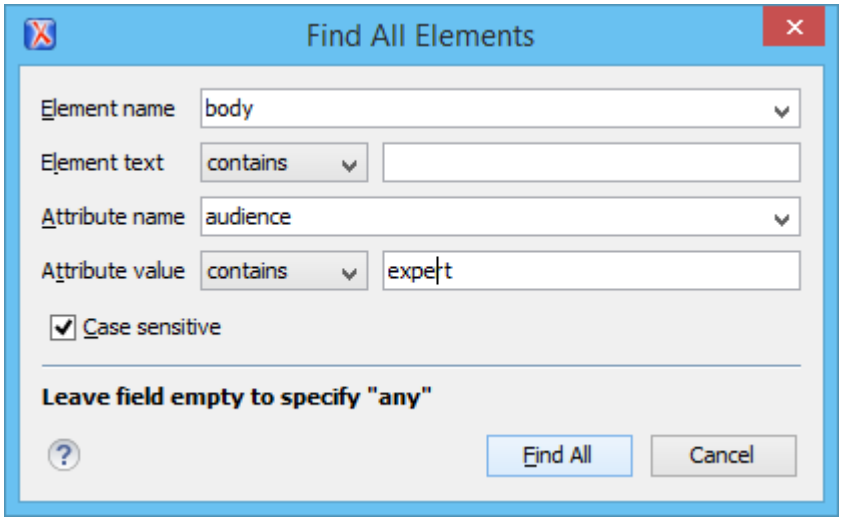
Built-in Refactoring Operations *(on page 856)*

Custom Refactoring Operations *(on page 868)*

Find All Elements Dialog Box

To open the **Find All Elements** dialog box, go to **Find > Find All Elements**(**Ctrl + Shift + E (Command + Shift + E on macOS)**) or from the shortcut **Find All Elements** that is available in the **Find / Replace** dialog box *(on page 442)*. It assists you in defining XML element / attribute search operations in the current document.

Figure 78. Find All Elements Dialog Box



The dialog box can perform the following actions:

- Find all the elements with a specified name.
- Find all the elements that contain, or does not contain, a specified string in their text content.
- Find all the elements that have a specified attribute.
- Find all the elements that have an attribute with, or without, a specified value.

You can combine all of these search criteria to filter your results.

The following fields are available in the dialog box:

- **Element name** - The qualified name of the target element to search for. You can use the drop-down menu to find an element or enter it manually. It is populated with valid element names collected from the associated schema. To specify *any* element name, leave the field empty.

  Note:
  Use the qualified name of the element (`<namespace prefix>:<element name>`) when the document uses this element notation.

- **Element text** - The target element text to search for. The drop-down menu beside this field allows you to specify whether you are looking for an exact or partial match of the element text. For *any* element text, select **contains** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements with no text will be found. Select **not contains** to find all elements that do not include the specified text.
- **Attribute name** - The name of the attribute that must be present in the element. You can use the drop-down menu to select an attribute or enter it manually. It is populated with valid attribute names collected from the associated schema. For *any* or no attribute name, leave the field empty.

Note:
Use the qualified name of the attribute (`<namespace prefix>:<attribute name>`) when the document uses this attribute notation.

- **Attribute value** - The drop-down menu beside this field allows you to specify that you are looking for an exact or partial match of the attribute value. For *any* or no attribute value, select **contains** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements that have at least an attribute with an empty value will be found. Select **not contains** to find all elements that have attributes without a specified value.
- **Case sensitive** - When this option is selected, operations are case-sensitive.

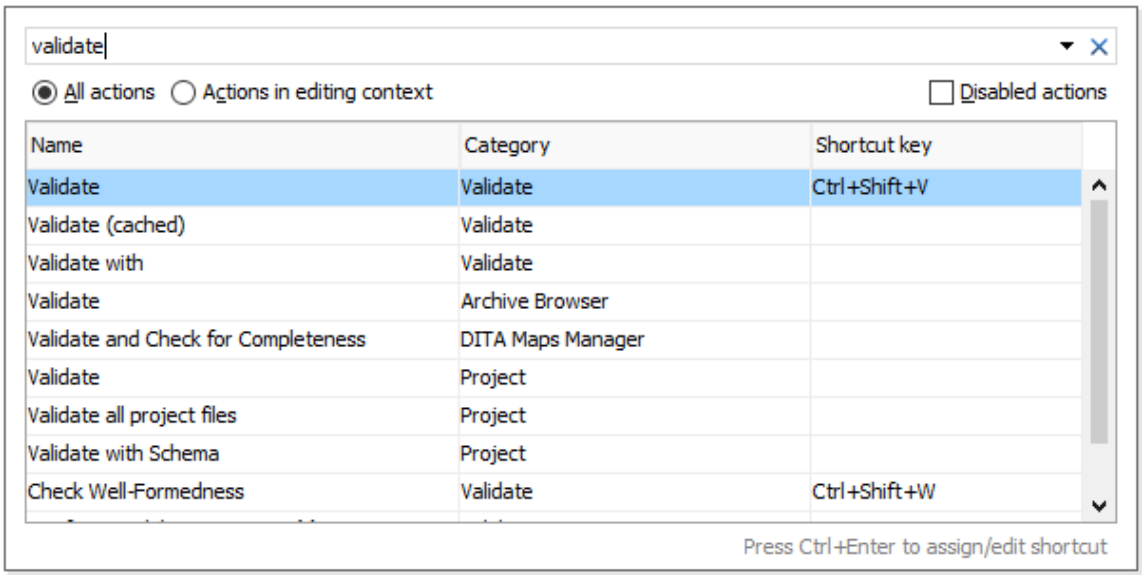
When you select **Find All**, Oxygen XML Editor tries to find the items that match all the search parameters. The results of the operation are presented as a list in the message panel.

Find and Invoke Actions

Oxygen XML Editor includes a **Find action** feature that provides a quick way to find actions that are available throughout the application. You can also assign shortcuts for particular actions and invoke actions using this feature.

The **Find action** operation is available in the **Find** or **Help** menus and it opens a pop-up window where all the actions are presented in a sortable, filterable table.

Figure 79. Find Action Pop-Up Window



This pop-up window includes the following features, options, and controls:

Search Field

You can use the search field at the top to search for a specific action and it includes a history drop-down down menu for quickly preforming recently-used search criteria. You can use the

Delete button to the right of the search field to clear the current text from the search field.
You can also search for actions using certain keyboard shortcuts (excluding the common editing commands such as **Delete**, **Home**, **End**, **Delete**, **Ctrl+A**, **Ctrl+C**, **Ctrl+V**, etc.)

Filtering Options

All actions

Filters the table to display all available actions.

Actions in editing context

Filters the table to display available actions based on the current editing context where the application is focused (for example, if the current focus is a particular side-view, the table displays actions that are available in that side-view).

Disabled actions

Filters the table to also display actions that are currently disabled.

Double-Click

You can double-click an action in the table (or select an action and press **Enter**) to execute the particular action. Some actions will not have an effect if they are not allowed in the current editing context.

Accessibility Shortcuts

The following keyboard shortcuts can be used to enjoy this feature using only a keyboard:

- **Ctrl + Alt + K** - Opens the **Find action** pop-up window feature.
- **Up arrow / Down arrow** - Navigates the table vertically and switches from the search field to the table, and vice versa.
- **Tab / Shift + Tab** - Navigates between the radio filtering options and the checkbox option.
- **Left arrow / Right arrow** - Toggles the selection for the radio filtering options.
- **Space** - Toggles the checkbox option.
- **Enter** - Executes the selected action.
- **Ctrl + Enter** - Opens a dialog box where you can assign a keyboard shortcut for the selected action.
- **Ctrl + Up arrow / Ctrl + Down arrow** - Accesses the history drop-down when the search field is in focus.
- **Esc** - Closes the **Find action** pop-up window feature.

Actions Table

Displays the available actions based on the selected filtering options or search criteria. Some actions might be disabled/deactivated depending on the current editing context. When the **Disabled action** filtering option is selected, the disabled actions are displayed at the end of the results in the table.

Note:
It is possible for certain actions not to be displayed in the actions table if they are created and implemented in other ways (for example, if they are implemented only to be available in a contextual menu).

Quick Find Toolbar

A reduced version of the **Find / Replace** dialog box *(on page 442)* is available as a dockable toolbar *(on page 369)*. To display it, press the **Alt + Shift + F (Command + Option + F on macOS)** key combination or select the **Find >** **Quick Find** action. By default, the toolbar is displayed at the bottom of the Oxygen XML Editor window, above the status bar, but can be changed at any time by dragging (and docking) it to a different location. To hide the toolbar, use the **Close** button.

All matches are highlighted in the current editor.

Figure 80. Quick Find Toolbar

The toolbar offers the following controls:

- Search input box - This is where you can insert the text you want to search for. The input box keeps a history of the last used search text. The background color of the input box turns red when no match is found.
- **Next** - Advances to the next match. You can also use the **Enter** key to jump forward to the next match.
- **Previous** - Jumps to the previous match. You can also use **Shift+Enter** to jump backward to the previous match.
- **All** - Highlights all matches of the search string in the current document.
- **Incremental** - If selected, the search operation is started every time you type or delete a character in the search input box.
- **Case sensitive** - If selected, the search operation follows the exact letter case of the search text.
- **Find/Replace** - Opens the **Find/Replace** dialog box *(on page 442)*.
- **Find/Replace in Files** - Opens the **Find/Replace in Files** dialog box *(on page 446)*.
- **Close** - Closes the **Quick Find** toolbar.

Keyboard Shortcuts for Finding the Next and Previous Match

Navigating from one match to the next or previous one is very easy to perform using the **F3** and **Shift + F3 (Command + Shift + G on macOS)** keyboard shortcuts. They are useful for quickly repeating the last find action performed in the **Find / Replace** dialog box *(on page 442)*, taking into account the same find options.

Restriction:
These shortcuts only take XPath expressions into account if the **Find / Replace** dialog box remains opened. Once you close it, the XPath expressions are no longer considered.

Regular Expressions Syntax

Oxygen XML Editor uses the Java regular expression syntax. It is **similar** to that used in Perl 5, with several exceptions. Thus, Oxygen XML Editor does not support the following constructs:

- The conditional constructs `(?{X})` and `(?(condition)X|Y)`.
- The embedded code constructs `(?{code})` and `(??{code})`.
- The embedded comment syntax `(?#comment)`.
- The preprocessing operations `\l`, `\u`, `\L`, and `\U`.

When using regular expressions, note that some sets of characters from XPath/XML Schema/Schematron are slightly different than the ones used by Oxygen XML Editor/Java in the text searches from the **Find/Replace** dialog box *(on page 442)* and **Find/Replace in Files** dialog box *(on page 446)*. The most common example is with the `\w` and `\W` set of characters. To ensure consistent results between the two, it is recommended that you use the following constructs in the **Find/Replace** dialog box *(on page 442)* and **Find/Replace in Files** dialog box *(on page 446)*:

- **/w** - `[#x0000-#x10FFFF]-[\p{P}\p{Z}\p{C}]` instead of `\w`
- **/W** - `[\p{P}\p{Z}\p{C}]` instead of `\W`

There are some other notable differences that may cause unexpected results, including the following:

- In Perl, `\1` through `\9` are always interpreted as back references. A backslash-escaped number greater than 9 is treated as a back reference if at least that many sub-expressions exist. Otherwise, it is interpreted, if possible, as an octal escape. In this class octal escapes must always begin with a zero. In Java, `\1` through `\9` are always interpreted as back references, and a larger number is accepted as a back reference if at least that many sub-expressions exist at that point in the regular expression. Otherwise, the parser will drop digits until the number is smaller or equal to the existing number of groups or it is one digit.
- Perl uses the `g` flag to request a match that resumes where the last match left off.
- In Perl, embedded flags at the top level of an expression affect the whole expression. In Java, embedded flags always take effect at the point where they appear, whether they are at the top level or within a group. In the latter case, flags are restored at the end of the group just as in Perl.
- Perl is forgiving about malformed matching constructs, as in the expression `*a`, as well as dangling brackets, as in the expression `abc]`, and treats them as literals. This class also accepts dangling brackets but is strict about dangling meta-characters such as `+`, `?` and `*`.

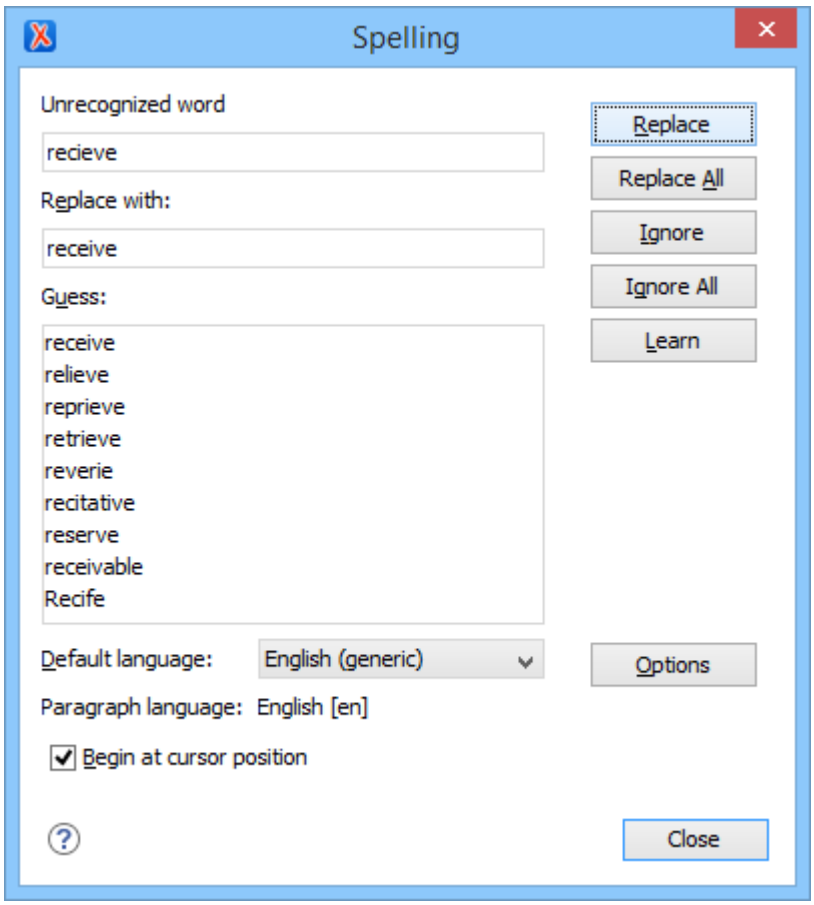
Comparison between the Java and Perl 5 regular expression syntax

Spell Checking

Oxygen XML Editor includes an automatic (as-you-type) spell checking feature *(on page 466)*, as well as a manual spell checking action to open a **Spelling** dialog box that offers a variety of options.

To manually check spelling in the current document, use the **Check Spelling** action on the toolbar or from the **Edit** menu.

Figure 81. Check Spelling Dialog Box



The **Spelling** dialog box contains the following:

Unrecognized word

Displays the word that cannot be found in the selected dictionary. The word is also highlighted in the XML document.

Replace with

The character string that will replace the misspelled word.

Guess

Displays a list of suggested words to replace the unknown word. Double-click a word to automatically insert it in the document and resume the spell checking process.

Default language

Allows you to select the default language dictionary used by the spelling engine.

Paragraph language

In an XML document, you can mix content written in multiple languages. You can set the language code in the `@lang` or `@xml:lang` attribute for any particular section and Oxygen XML

Editor will automatically instruct the spell checker engine to apply the appropriate language dictionary for that section.

Begin at cursor position

Instructs the spell checker to begin checking the document starting from the current cursor position.

Action Buttons

Replace

Use this button to replace the unrecognized word with the selected word from the **Replace with** field.

Replace All

Use this button to replace all occurrences of the unrecognized word with the selected word from the **Replace with** field, starting from the cursor's position to the end of the document.

> **Note:**
> This action is case-sensitive.

Ignore

Ignores the first occurrence of the unrecognized word and allows you to continue checking the document. Oxygen XML Editor skips the content of the XML elements marked to be ignored *(on page 466)*.

Ignore All

Ignores all instances of the unrecognized word in the current document.

Learn

Adds the unrecognized word to the list of valid words.

Options

Opens the **Spell Check** preferences page *(on page 238)* where you can configure various options regarding the feature.

AutoCorrect Misspelled Words *(on page 470)*

Spell Check Dictionaries and Term Lists

Oxygen XML Editor uses the **Hunspell** engine for the spell checking feature. The Hunspell spell checking engine is open source and has an LGPL license. It is designed for languages with rich morphology and complex compounding or character encoding. Each language-country variant combination have their own specific dictionaries. Oxygen XML Editor includes the following built-in dictionaries for the spell checker:

- English (US) [`en_US`]
- English (UK) [`en_GB`]
- French [`fr`]
- German [`de_DE`]
- Spanish [`es_ES`]

Other Hunspell Dictionaries

You can also download Hunspell dictionaries for other languages and add them to the Oxygen XML Editor spell checker. An example of a website that includes numerous dictionary files is: http://extensions.services.openoffice.org/dictionary.

If you cannot find a Hunspell dictionary that is already built for your language, you can build the dictionary you need. To build a full Hunspell dictionary, follow these instructions and then add the dictionary to the Oxygen XML Editor spell checker by following this procedure *(on page 461)*.

Personalized Term Lists

Authoring in certain areas of expertise (for example, the pharmaceutical or automobile industries) might require the use of specific terms that are not part of the standard spell checker dictionary. To avoid marking these terms as errors, Oxygen XML Editor provides a way of adding personalized *term lists (on page 463)* to the spell check engine. This involves creating a term list file that the spell checker will recognize and it is similar to the file Oxygen XML Editor uses for storing *learned words (on page 466)*.

The term list files are specific for each language and can be specific to each domain or area of expertise (for example, *legal*, *medical*, *automotive*). They can also be used to control forbidden words.

Related information

Adding Custom Spell Check Dictionaries *(on page 461)*
Adding Custom Spell Check Term Lists *(on page 463)*
Building and Testing Hunspell Dictionaries

Adding Custom Dictionaries and Term Lists

The Oxygen XML Editor spell checker allows you to add customized Hunspell dictionaries and personalized term lists. The Hunspell dictionary mechanism requires a dictionary file (with a `.dic` file extension) and an affix file (with the `.aff` file extension). The personalized term lists are custom files (with the `.tdi` file extension) that you can create to include specialized terms or specify forbidden words in the Oxygen XML Editor spell checker.

You can add dictionaries *(on page 461)* and personalized term lists *(on page 463)* to the default folder where they are stored or specify your own custom locations. You can view the default storage location in the **Spell Check Dictionaries** preferences page *(on page 241)* and the **Include dictionaries and term list from** option *(on page 241)* allows you to choose a custom storage location. All the dictionaries and term lists for a

particular language that are found in either location are merged and used by the spell checker in Oxygen XML Editor.

Replacing a Spell Check Dictionary *(on page 464)*

Editing the Spell Checking Dictionaries

Adding Custom Spell Check Dictionaries

There are three possible scenarios for adding Hunspell dictionaries to the Oxygen XML Editor spell checker:

- You can download a pre-built Hunspell dictionary and add it to the spell checking mechanism.
- You can create a custom Hunspell dictionary file that defines your own list of words and add it to the spell checking mechanism.
- You can build your own full Hunspell dictionary and add it to the spell checking mechanism.

Download and Add a Pre-Built Hunspell Dictionary

To add a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a *dictionary* file (with a `.dic` file extension) and an *affix* file (with the `.aff` file extension). If the dictionary does not include an affix file (`.aff`), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: http://extensions.services.openoffice.org/dictionary.

   Important:
   The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, `en_US_medical.dic` for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: `en_medical.dic`). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Spell Check > Dictionaries** *(on page 241)*.
3. Choose one of the following two options for adding the downloaded files.
   a. Copy both files (`.dic` and `.aff`) to the default directory displayed in the **Dictionaries and term lists default folder** option *(on page 241)*.
   b. Copy both files (`.dic` and `.aff`) to any other directory, select the **Include dictionaries and term list from** option *(on page 241)*, and select that directory. If you choose this option, make sure you read this important note *(on page 241)*.
4. Restart the application for the spell checker to start using the new dictionary.

Create a Custom Hunspell Dictionary that Defines a List of Words

To create a custom Hunspell dictionary that defines your own list of words, follow these steps:

1. Create a *dictionary* file (with a `.dic` file extension) and an *affix* file (with the `.aff` file extension). The affix file (`.aff`) can be left empty, but it is needed for the mechanism to work properly.

   Important:
   The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, `en_US_medical.dic` for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: `en_medical.dic`). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. In the dictionary file (`.dic` extension), add the words you want to be included in your custom dictionary. Add one word per row and the first line needs to contain the number of words, as in the following example:

   ```
   2
   parabola
   asimptotic
   ```

   Tip:
   Words stored in dictionaries are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

   Note:
   If you save the `.dic` file using UTF-8 encoding, then the corresponding `.aff` file should specify the encoding as a property inside it (if you do not specify the encoding, the default platform encoding will be used):

   ```
   SET UTF-8
   ```

3. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Spell Check > Dictionaries** *(on page 241)*.
4. Choose one of the following two options for saving the files.
   a. Save both files (`.dic` and `.aff`) to the default directory displayed in the **Dictionaries and term lists default folder** option *(on page 241)*.
   b. Save both files (`.dic` and `.aff`) to any other directory, select the **Include dictionaries and term list from** option *(on page 241)*, and select that directory. If you choose this option, make sure you read this important note *(on page 241)*.
5. Restart the application for the spell checker to start using the new dictionary.

Build and Add a Full Hunspell Dictionary

To build and add a full Hunspell dictionary, follow these steps:

1. Create your Hunspell dictionary. For more information on how to do this, see: Editing the Spell Checking Dictionaries.

   Step Result: You should end up with a *dictionary* file (with a `.dic` file extension) and an *affix* file (with an `.aff` file extension). The affix file (`.aff`) can be empty, but it is needed for the mechanism to work properly.

   > **Important:**
   > The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, `en_US_medical.dic` for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: `en_medical.dic`). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Spell Check > Dictionaries** *(on page 241)*.
3. Choose one of the following two options for saving the files.
   a. Save both files (`.dic` and `.aff`) to the default directory displayed in the **Dictionaries and term lists default folder** option *(on page 241)*.
   b. Save both files (`.dic` and `.aff`) to any other directory, select the **Include dictionaries and term list from** option *(on page 241)*, and select that directory. If you choose this option, make sure you read this important note *(on page 241)*.
4. Restart the application for the spell checker to start using the new dictionary.

Related information
Adding Custom Spell Check Term Lists *(on page 463)*
Editing the Spell Checking Dictionaries

Adding Custom Spell Check Term Lists

You can create personalized term lists that are used to store specialized terms or control forbidden words. They can then be added to one of the directories that store the spell check dictionaries, and the spell checker will merge them with all the dictionaries and other term lists for a particular language.

Create and Add Personalized Term Lists

To create and add a personalized term list, follow these steps:

1. Create a *term list* file (with the `.tdi` file extension). The name of the file must begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, `en_US_myterms.tdi` for term list in the US version of the English language or `en_myterms.tdi` for a less specific English term list). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.
2. In the term list file (`.tdi` extension), add the terms you want to be included in your custom dictionary. If you need to specify forbidden terms, those words simply need to be preceded by an asterisk. Add one word per row, as in the following example:

   ```
   parabola
   asimptotic
   *hyperbola
   ```

   Note:
   Words stored in term lists are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.
3. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Spell Check > Dictionaries** *(on page 241)*.
4. Choose one of the following two options for saving the file.
   a. Save the file (`.tdi`) to the default directory displayed in the **Dictionaries and term lists default folder** option *(on page 241)*.
   b. Save the file (`.tdi`) to any other directory, select the **Include dictionaries and term list from** option *(on page 241)*, and select that directory. If you choose this option, make sure you read this important note *(on page 241)*.
5. Restart the application for the spell checker to start using the new term list.

Adding Custom Spell Check Dictionaries *(on page 461)*

Replacing a Spell Check Dictionary

There are several possible scenarios for replacing an existing Hunspell dictionary for the Oxygen XML Editor spell checker:

- You can download a pre-built Hunspell dictionary and replace an existing dictionary with it.
- You can build your own full Hunspell dictionary and replace an existing dictionary with it.

Download a Pre-Built Hunspell Dictionary and Replace an Existing One

To replace an existing dictionary with a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a *dictionary* file (with a `.dic` file extension) and an *affix* file (with the `.aff` file extension). If the dictionary does not include an affix file (`.aff`), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: http://extensions.services.openoffice.org/dictionary.
2. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Spell Check > Dictionaries** *(on page 241)*.
3. Choose one of the following two options to replace existing files.
    a. Replace the existing files (`.dic` and `.aff`) for the particular language in the default directory displayed in the **Dictionaries and term lists default folder** option *(on page 241)*. Leave the **Include dictionaries and term list from** option deselected.
    b. Replace existing files (`.dic` and `.aff`) for the particular language in a directory specified in the **Include dictionaries and term list from** option *(on page 241)*. If you choose this option, make sure you read this important note *(on page 241)*.

    Important:
    Do not alter the naming convention. The name of the files must begin with a two letter prefix that indicates the language it should be attached to (for example, `en_US.dic` for a US English dictionary or `en.dic` for a less specific English dictionary). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.
4. Restart the application for the spell checker to start using the new dictionary.

Build a Full Hunspell Dictionary and Replace an Existing One

To replace an existing dictionary with a full Hunspell dictionary that you build, follow these steps:

1. Follow these instructions: Building and Testing Hunspell Dictionaries.

    Step Result: You should end up with a *dictionary* file (with a `.dic` file extension) and an *affix* file (with the `.aff` file extension). The affix file (`.aff`) can be empty, but it is needed for the mechanism to work properly.
2. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Spell Check > Dictionaries** *(on page 241)*.
3. Choose one of the following two options to replace existing files.
    a. Replace the existing files (`.dic` and `.aff`) for the particular language in the default directory displayed in the **Dictionaries and term lists default folder** option *(on page 241)*. Leave the **Include dictionaries and term list from** option deselected.
    b. Replace existing files (`.dic` and `.aff`) for the particular language in a directory specified in the **Include dictionaries and term list from** option *(on page 241)*. If you choose this option, make sure you read this important note *(on page 241)*.
4. Restart the application for the spell checker to start using the new dictionary.

Related information

Adding Custom Dictionaries and Term Lists *(on page 460)*

Learned Words

Spell checker engines rely on dictionaries to decide if a word is spelled correctly. To instruct the spell checker engine that an unknown word is actually correctly spelled, you need to add that word to a list of learned words. There are two ways to do this:

- Invoke the contextual menu on an unknown word, then select **Learn word**.
- Click the **Learn** button from the **Spelling** dialog box *(on page 457)* that is invoked by using the **Check Spelling** action on the toolbar.

Note:
To delete items from the list of learned words, use the **Delete learned words** option in the **Editor > Spell Check > Dictionaries** preferences page *(on page 241)*.

Related information

Adding Custom Spell Check Term Lists *(on page 463)*

Ignored Words (Elements)

You may want the content of certain XML elements to always be skipped during the spell check process (for example, `<programlisting>`, `<codeblock>`, `<codeph>`, `<filepath>`, or `<screen>`). This can be done in one of several ways:

- You can skip through them manually, word by word, using the **Ignore** button in the **Spelling** dialog box *(on page 457)* that is invoked by using the **Check Spelling** action on the toolbar.
- You can automatically skip the content of certain elements by maintaining a set of known element names that should never be checked. You can manage this set of element names by using the **Ignore elements** section *(on page 240)* in the **Spell Check** preferences page.

Automatic Spell Check

Oxygen XML Editor includes an option to automatically check the spelling as you type. Not only does it check spelling when you are typing in the main editor, but also when you are typing in a comment *(on page 664)*. This feature is disabled by default, but it can be enabled and configured in the **Spell Check** preferences page *(on page 238)*. When the **Automatic Spell Check** option *(on page 238)* is selected, unknown words are underlined and some actions are available in the contextual menu to help you correct the word or prevent the word from being reported in the future.

Figure 82. Automatic Spell Checking in Author Mode

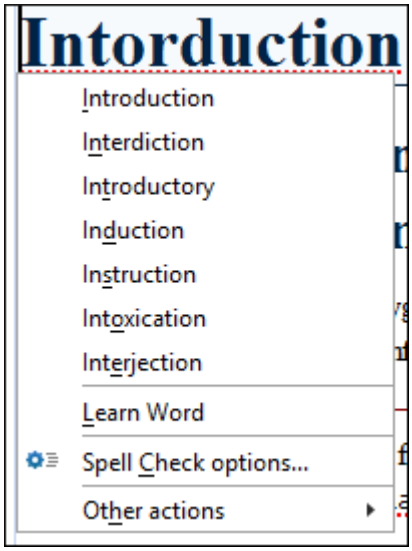

Figure 83. Automatic Spell Checking in Text Mode

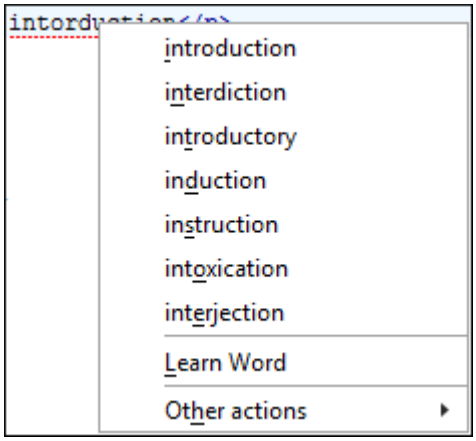


The contextual menu includes the following actions:

Delete Repeated Word

Allows you to delete words that were repeated in consecutive order.

List of Suggestions

A list of words suggested by the spell checking engine as possible replacements for the unknown word.

Learn Word

Allows you to add the current unknown word to the persistent dictionary of learned words *(on page 466)*.

Spell check options (Available in Author mode only)

Opens the **Spell Check** preferences page *(on page 238)*.

Other actions

This submenu give you access to all the usual contextual menu actions.

Related information

Learned Words *(on page 466)*

Spell Check Multiple Files

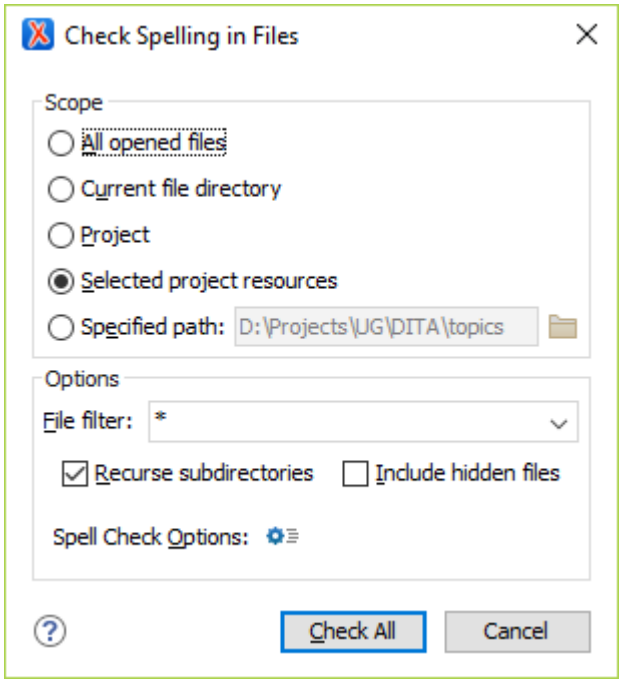
The **Check Spelling in Files** action allows you to check the spelling on multiple local or remote documents. This action is available in the following locations:

- The **Edit** menu.
- The contextual menu of the **Project** view *(on page 413)*.
- The contextual menu of the **DITA Maps Manager** view *(on page 3073)*, when editing DITA documents.

This action opens the **Check Spelling in Files** dialog box that allows you to define the scope and several other options. After you configure the settings for the operation, click the **Check All** button to check the spelling in all specified files. The spelling corrections are displayed in the **Results** view *(on page 558)* view at the bottom of the editor and you can group the reported errors as a tree with two levels.

Tip:
If you want to instruct the spell checking engine to not report a particular word as being a spelling error in the future, use the **Learn Word(s)** action from the contextual menu in the **Results** view.

Figure 84. Check Spelling in Files Dialog Box (Invoked from Project View)



The following scopes are possible, depending on where the action was invoked:

- **All opened files** - The spell check is performed in all open files.
- **Current file directory** - All the files in the folder of the currently edited file.

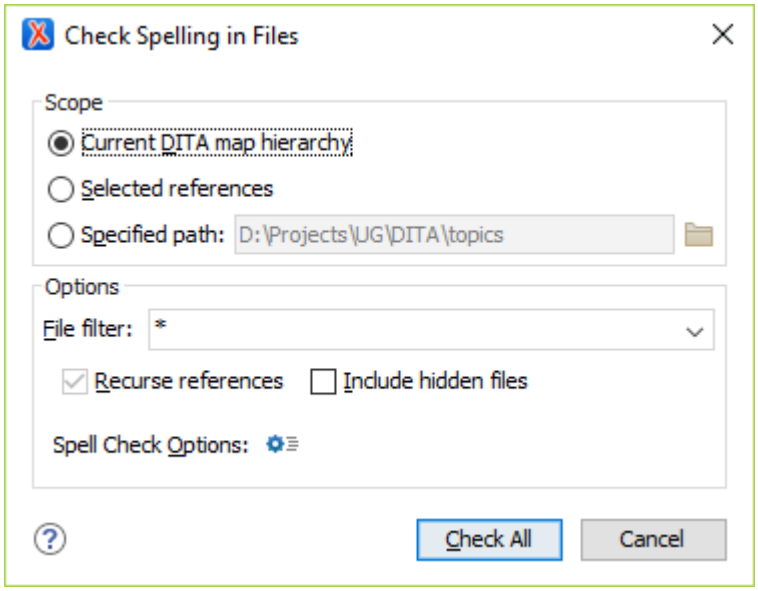
- **Current DITA map hierarchy** - Option available when the dialog is invoked from the **DITA Maps Manager** view. Checks the spelling in all references contained in the DITA map.
- **Project** - All files from the current project.
- **Selected project resources** - The selected files from the current project.
- **Specified path** - Checks the spelling in the files located at a path that you specify.

The **Options** section includes the following options:

- **File filter** - Allows you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the spell check is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the spell check is also performed in the hidden files.
- **Spell Check Options** - The spell check processor uses the options available in the **Spell Check** preferences page *(on page 238)*.

When working with DITA documents, if you invoke the **Check Spelling in Files** action in the **DITA Maps Manager** view *(on page 3073)*, a slightly different version of the dialog box is displayed:

Figure 85. Check Spelling in Files Dialog Box (Invoked from the DITA Maps Manager View)



The following scopes are available when you check the spelling in files from the **DITA Maps Manager** *(on page 3073)*:

- **Current DITA Map hierarchy** - All the files referenced in the currently selected *DITA map (on page 3419)* from in the **DITA Maps Manager** view.
- **Selected references** - Checks the spelling in the selected references.
- **Specified path** - Checks the spelling in the files located at a path that you specify.

AutoCorrect Misspelled Words

Oxygen XML Editor includes an *AutoCorrect* feature to automatically correct misspelled words, as well as to insert certain symbols or other text, as you type in **Author** mode. Oxygen XML Editor includes a default list of commonly misspelled words and symbols, but you can modify the list to suit your needs. You can also choose to have the *AutoCorrect* feature use suggestions from the main spell checker. The suggestions will only be used if the misspelled words are not found in the *Replacements Table (on page 202)*.

When enabled, the *AutoCorrect* feature can be used to do the following:

- Automatically correct misspelled words while you edit in **Author** mode. The actual operation of replacing a word is triggered by a space, dash, or certain punctuation characters (`, . ; : ? ! ' " ) ] }`).
- Easily insert symbols. For example, if you want to insert a ® character, you would type `(R)`.
- Quickly insert text fragments.
- Quickly insert XML fragments. For example, if you enter a hyphen (**-**) in an empty paragraph followed by a space, it will automatically be converted to a list with a list item.

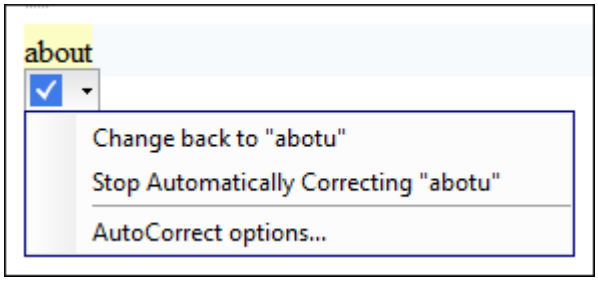
AutoCorrect is enabled by default. To configure this feature, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit Modes > Author > AutoCorrect**.

AutoCorrect Drop-down Actions

After the automatic operation of replacing a misspelled word (triggered by a space, dash, or certain punctuation characters), the affected string is highlighted. The highlight is removed upon the next editing action (text insertion or deletion). If you hover over the highlight, a small widget appears below the word. If you hover over the widget, it expands and you can click it to present a drop-down list that includes the following actions:

- **Change back to "[original word]"** - Reverts the correction back to its original form.
- **Stop Automatically Correcting "[original word]"** - This option is presented if the correction is performed based on the *AutoCorrect Replacements Table (on page 202)* and selecting it will delete the corresponding entry from the Replacements Table.
- **Learn Word "[original word]"** - This option is presented if the **Use additional suggestions from the spell checker** option *(on page 201)* is selected in the **AutoCorrect** preferences page *(on page 201)* and the correction is performed based on the *Spell Checker*. Selecting this option will add the item to the list of learned words *(on page 466)*.
- **AutoCorrect options** - Opens the **AutoCorrect** preferences page *(on page 201)* that allows you to configure the feature.

Figure 86. AutoCorrect Drop-down Actions



AutoCorrect Case-Sensitivity

The *AutoCorrect* feature results in the following types of substitutions regarding case-sensitivity:

- Words with all lower-case characters will be replaced with lower-case substitutions (for example, "*abotu*" is replaced with "*about*").
- Words with irregular-case characters will be replaced with lower-case substitutions ("*ABotU*" is replaced with "*about*").
- Words with all upper-case characters will be replaced with upper-case substitutions ("*ABOTU*" is replaced with "*ABOUT*").
- Words starting with an upper-case character will be replaced with substitutions having the same pattern ("*Abotu*" is replaced with "*About*").

Note:
The *AutoCorrect* feature also uses the list of **ignored elements from the Spell Check preferences page** *(on page 240)*. All elements (along with their descendant elements) included in this list will be ignored by the *AutoCorrect* engine.

Related information
Spell Checking *(on page 457)*

Add Dictionaries for the AutoCorrect Feature

To add new dictionaries for the *AutoCorrect* mechanism *(on page 470)*, or to replace an existing one, follow these steps:

1. Download an *AutoCorrect* dictionary file for the desired language. The file needs to have a `.dat` file extension. An example of a website that includes some *AutoCorrect* dictionary files is: OpenOffice Extensions Search Page.
2. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit Modes > Author > AutoCorrect > Dictionaries** *(on page 203)*.
3. Choose one of the following two options for adding the downloaded files:

a. Copy the downloaded `.dat` file to the default directory displayed in the **Dictionaries default folder** option. *(on page 203)*. Note that if you are replacing an existing dictionary file, this is the best option.
b. Copy the downloaded `.dat` file to any other directory, select the **Include dictionaries from** option *(on page 203)*, and select that directory. If you choose this option, make sure you read this important note *(on page 203)*.

4. Restart the application for the *AutoCorrect* mechanism to start using the new dictionary.

Working with Special Characters and Encoding

While regular characters make up the English and European alphabets and the corresponding basic set of figures and symbols, there are many other *special characters* that belong to various other language representations, such as Arabic, Indian, Japanese, Chinese, or Korean. Oxygen XML Editor provides support for special characters in various ways:

Opening and Saving Documents

The Unicode standard provides support for all the character symbols in all known languages andOxygen XML Editor provides support for all Unicode characters *(on page 473)*. There are various encoding options and features to help determine how to handle documents with unsupported characters *(on page 474)*.

Fonts

Oxygen XML Editor provides the ability to choose the fonts to be used in the various editing modes *(on page 140)*. In some cases, changing the font may be a solution when special characters are not rendered as expected.

For special characters that are not included in any of the default fonts, Oxygen XML Editor tries to find that symbol in a *fallback* font *(on page 474)*. For the **Author** editing mode, you can specify a set of fallback fonts in the `font-family` CSS property (in the particular CSS file used for rendering your documents). For more information, see the CSS Support in Author Mode *(on page 2424)* section.

Tip:
For documents written in languages that use special characters (such as Japanese or Chinese), change the font to one that supports the specific characters (a Unicode font). For the Windows platform, *Arial Unicode MS* or *MS Gothic* is recommended. To change the font in Oxygen XML Editor, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Appearance > Fonts**. You can select a font for each editing mode in this preferences page.

Navigation and Layout

Oxygen XML Editor supports bidirectional text, such as Arabic, Hebrew, and certain Asian languages, or other special characters that are combined into a single glyph. In **Text** mode, you

can enable or disable the support for special characters. See Special Character Support in Text Mode *(on page 574)* for details about which option to choose.

Editing

Oxygen XML Editor includes a contextual menu action that converts a sequence of hexadecimal characters to the corresponding Unicode character *(on page 579)*.

If you do not have a special way of inserting special characters using your keyboard, you can insert special characters using the **Character Map** feature *(on page 475)*.

For more information about working with special characters in specific editing modes, see the following sections:

- Special Character Support in Author Mode *(on page 763)*
- Special Character Support in Text Mode *(on page 574)*
- Special Character Support in Grid Mode *(on page 596)*

Unicode Support

Unicode is a standard for providing consistent encoding, representation, and handling of text. There is a unique Unicode number for every character, independent of the platform and language. Unicode is internationally recognized and is required by modern standards (such as XML, Java, JavaScript, LDAP, CORBA 3.0, WML, etc.).

Oxygen XML Editor provides support for the Unicode standard, enabling your XML application to be targeted across multiple platforms, languages, and countries without re-engineering. Internally, the Oxygen XML Editor uses 16-bit characters covering the Unicode Character set.

As a Java application, Oxygen XML Editor includes a default Java input method for typing characters with Unicode codes. However, the default input method does not cover all the Unicode codes (for example, the codes for some accented characters or characters found in East Asian languages). Such characters can be inserted in the editor panel of Oxygen XML Editor either with the **Character Map** dialog box *(on page 477)* available from **Edit > Insert from Character Map** or by installing a Java input method that supports the insertion of the needed characters. The installation of a Java input method depends on the platform (Windows, macOS, Linux, etc.) and is the same for any Java application.

Note:
Oxygen XML Editor may not be able to display characters that are not supported by the operating system (either not installed or unavailable).

Tip:
On windows, you can enable the support for **CJK** (Chinese, Japanese, Korean) languages from **Control Panel / Regional and Language Options / Languages / Install files for East Asian languages**.

Related information

Unicode Fallback Font Support *(on page 474)*

Inserting Special Characters with the Character Map *(on page 475)*

Opening and Saving Documents with Unsupported Characters

When loading documents, Oxygen XML Editor reads the document prolog to determine the specified encoding type. This encoding is then used to instruct the Java Encoder to load support for and to save the document using the specified code chart. When the encoding type cannot be determined, Oxygen XML Editor displays the **Available Java Encodings** dialog box that provides a list of all encodings supported by the Java platform.

Opening Documents with Unsupported Characters

When opening a document in Oxygen XML Editor, if it contains characters that are not supported by the specified encoding standard (these unrecognized characters are rendered as an empty box ☐), the application determines how to handle them based upon the setting specified in the **Encoding Errors Handling** option in the **Encoding** preferences page *(on page 176)*. The default setting is **REPORT**, which means an error message is displayed for characters that cannot be represented in the specified encoding. If the option is set to **REPLACE**, the character is replaced with a standard replacement character for the particular encoding. If the option is set to **IGNORE**, the error is ignored and the character is not rendered.

Saving Documents with Unsupported Characters

When saving a document edited in the **Text**, **Grid**, or **Design** modes, if it contains characters that are not supported by the encoding declared in the document prolog, Oxygen XML Editor displays a notification that you need to resolve the conflict before saving the document.

When saving a document edited in the **Author** mode, all characters that fall outside the detected encoding will be automatically converted to hexadecimal character entities.

When saving a document with UTF-16 encoding, the saved document has a Byte Order Mark (BOM) that specifies the byte order of the document content. The default byte order is platform-dependent. That means that a UTF-16 document created on a Windows platform (where the default byte order mark is *UnicodeLittle*) has a different BOM than one created on a macOS platform (where the byte order mark is *UnicodeBig*). The byte order and the BOM of an existing document are preserved when the document is edited and saved. This behavior can be changed in Oxygen XML Editor from the **Encoding** preferences page *(on page 175)*.

Unicode Fallback Font Support

Oxygen XML Editor provides fonts for most common Unicode ranges. However, if you use special symbols or characters *(on page 475)* that are not included in the default fonts, they will be rendered as small rectangles. A *fallback* font is a reserve typeface that contains symbols for as many Unicode characters *(on page 473)* as possible. When a display system encounters a character that is not part of the range of any of the available fonts, Oxygen XML Editor will try to find that symbol in a *fallback* font.

Example of a Scenario Where a Fallback Font is Needed

Suppose that you need to insert the wheelchair symbol (♿ - U+267F) into your content in a Windows operating system. By default, Oxygen XML Editor does not render this symbol correctly since it is not included in any of the default fonts. It is included in **Segoe UI Symbol**, but this font is not part of the default fonts that come with Oxygen XML Editor. To allow Oxygen XML Editor to recognize and render the symbol correctly, you can add **Segoe UI Symbol** as a *fallback* font.

Adding a Fallback Font in Windows (7 or Later)

To add a fallback font to the Oxygen XML Editor installation, use the following procedure:

1. Start Windows Explorer and browse to the `[OXYGEN_INSTALL_DIR]/jre/lib/fonts` directory.
2. Create a directory called `fallback` (if it is not already there).
3. Copy a font file (True Type Font - TTF) that includes the special characters into this directory.

   > **Tip:**
   > You could, for example, copy the *Segoe UI Symbol Regular* font from `C:\Windows\Fonts`.

4. Restart Oxygen XML Editor for the changes to take full effect.

Result: Whenever Oxygen XML Editor finds a character that cannot be rendered using its standard fonts, it will look for the glyph in the fonts stored in the `fallback` folder.

Adding a Fallback Font in Other Platforms

For macOS or other platforms, you could use the following approach:

1. Use a font editor (such as FontForge) to combine multiple true type fonts into a single custom font.
2. Install the font file into the dedicated font folder of your operating system.
3. In Oxygen XML Editor, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Appearance > Fonts**.
4. Click the **Choose** button for the particular editing mode (**Editor** for **Text** mode) and select your custom font from the drop-down list in the subsequent dialog box.
5. Restart Oxygen XML Editor for the font changes to take full effect.

Related information

Unicode Support *(on page 473)*
Inserting Special Characters with the Character Map *(on page 475)*

Inserting Special Characters with the Character Map

Oxygen XML Editor includes a **Character Map** for inserting special characters. It can also be used to find the decimal, hexadecimal, or *character entity* equivalent for a particular character or symbol.

Inserting Special Characters

To insert a special character at the current location within a document, follow these steps:

1. Open the **Character Map** dialog box *(on page 477)* by selecting **More symbols** from the Ω **Symbols** drop-down menu on the toolbar (if this button is not displayed, right-click in the toolbar area, select **Configure Toolbars** and chosen to display the **Symbols** toolbar *(on page 374)*).
2. Find the symbol you want to insert and double-click it (or select it and click **Insert**).

> **Tip:**
> The most recently used characters and some of the most common characters are listed when you click the Ω **Symbols** drop-down button so you can easily insert any of those characters by simply selecting it from the drop-down.

Finding the Decimal, Hexadecimal, or Character Entity Equivalent

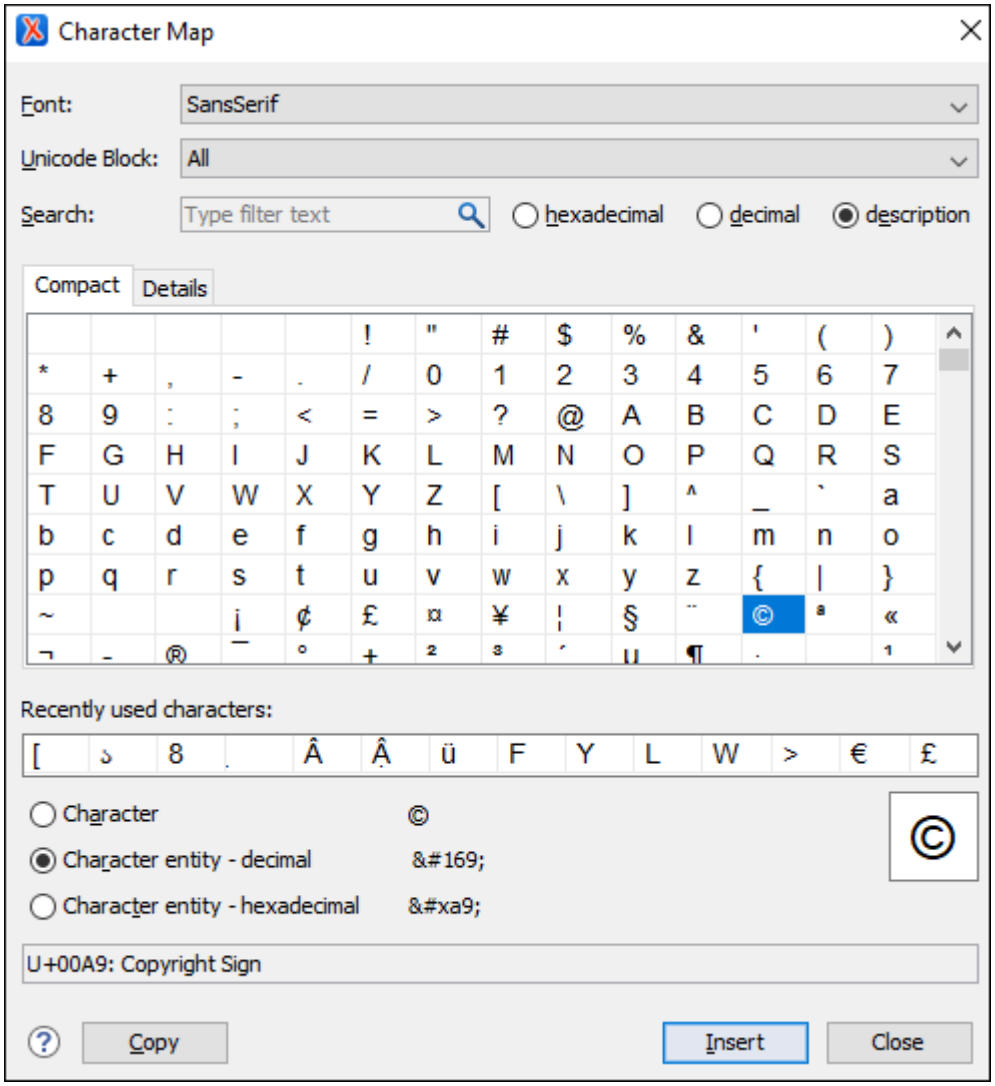
You can see the hexadecimal value for any character that is already inserted in your document by placing the cursor right after the character and you can see its value in the status bar at the bottom of the application.

For other characters, or to find the decimal equivalent, or even the *character entity* equivalent, following these steps:

1. Open the **Character Map** dialog box *(on page 477)* by selecting **More symbols** from the Ω **Symbols** drop-down menu on the toolbar (if this button is not displayed, right-click in the toolbar area, select **Configure Toolbars** and chosen to display the **Symbols** toolbar *(on page 374)*).
2. Find the symbol and select it. You can use the filters and the **Search** field at the top of the dialog box to narrow the search.
3. Click the **Details** tab on top of the preview window to see the decimal, hexadecimal, and description of the character. The *character entity* equivalent (both its decimal and hexadecimal values) are displayed at the bottom of the dialog box.

Character Map Dialog Box

Figure 87. Character Map Dialog Box



The **Character Map** dialog box allows you to visualize all characters that are available in a particular font, pick the character you need, and insert it in the document you are editing. It includes the following fields and sections:

Font

Use this drop-down list to choose the font that will have characters displayed.

Unicode Block

Use this drop-down list to only see a certain range of characters. This will filter the number of characters displayed, showing only a contiguous range of characters corresponding to the selected block. Unassigned characters are displayed as empty squares.

Search

Use this filter to search for a character by one of the following attributes:

- **hexadecimal**
- **decimal**

- **description**

> **Note:**
> Selecting **description** opens the **Details** tab *(on page 478)*. If you enter a character description in the **Search** field, the **description** is selected automatically.

Character Table Section

The characters that are available to be inserted are listed in two tabs:

- **Compact** - Matrix-like table that displays a visual representation of the characters.
- **Details** - Displays the available characters in a tabular format, presenting their decimal and hexadecimal value along with their description.

Recently Used Characters Section

Displays the symbols that you have used recently and you can also select one from there to insert it in the current document.

Character Mode Section

The next section of the dialog box allows you to select how you want the character to appear in the **Text** editing mode. You can choose between the following:

- **Character**
- **Character entity - decimal**
- **Character entity - hexadecimal**

You can see the character or code that will be inserted in **Text** mode next to the selections in this section and a box on the right side of the dialog box allows you to see the character that will be inserted in **Author** mode. You can also see the name and range name of a character either at the bottom of the dialog box, or in a tooltip when hovering the cursor over the character.

Click the **Insert** button to insert the selected character in the current editor at the cursor position. You will see the character in the editor if the editor font *(on page 140)* is able to render it. The **Copy** button copies it to the clipboard without inserting it in the editor.

> **Note:**
> The **Character Map** dialog box cannot be used to insert Unicode characters in the **Grid** editor *(on page 363)*. Accordingly, the **Insert** button of the dialog box will be disabled if the current document is edited in **Grid** mode.

Related information

Working with Special Characters and Encoding *(on page 472)*

Image Preview

Images and SVG files can be previewed in a separate pane. The supported image types are GIF, JPEG/JPG, PNG, BMP.

There are several ways to open an image in the **Image Preview** pane:

- In the **Project** view *(on page 413)*, double-click the image name.
- In the **Project** view *(on page 413)*, right-click an image and select **Preview**.
- In the **DITA Maps Manager** view *(on page 3073)*, double-click the key definition of the image.
- In the **DITA Maps Manager** view *(on page 3073)*, right-click the key definition of the image and select **Open**.
- In **Text** mode, **Ctrl + Mouse Click** or **Ctrl + Enter** with the cursor located within the image file path.

Once the image is displayed in the **Image Preview** pane, you have access to some contextual menu actions by right-clicking anywhere in the **Image Preview** pane. You can scale the image to its original size (by selecting the **1:1** action) or scale it down to fit in the pane (by selecting the **Scale to fit** action). Other actions include **Open in System Application**, **Print preview**, and **Print**.

If the image is an SVG file *(on page 1285)*, the **Image Preview** pane also includes the following other contextual menu actions: **Zoom in**, **Zoom out**, **Rotate**, and **Refresh**.

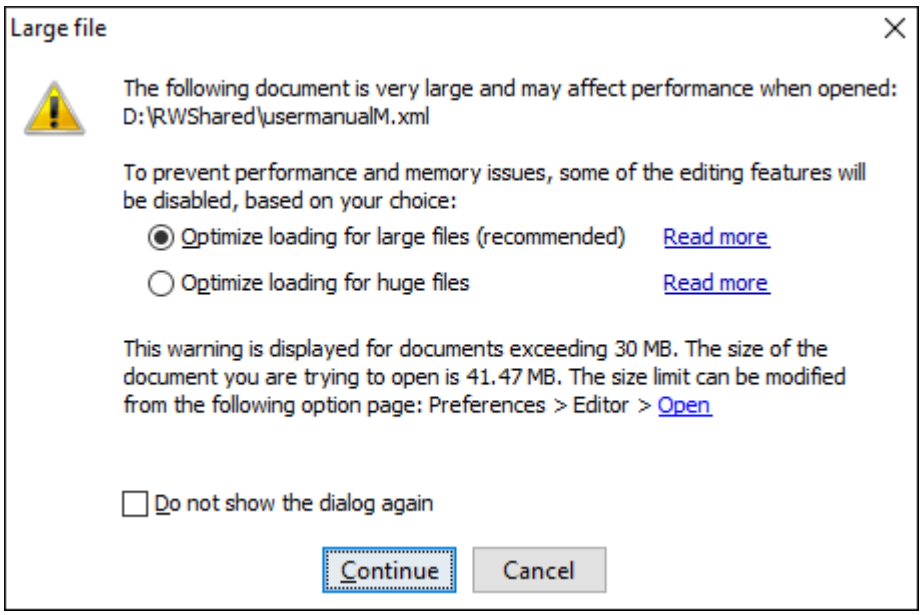
While the **Image Preview** view is visible, selecting an image in the **Project** view *(on page 413)* or **DITA Reusable Components** view *(on page 3242)* will automatically display the resource in the view. Also, as long as the **Link with Editor** toggle action (located on the **Project** view's toolbar) is enabled, focusing on the image in the **Image Preview** view will select the image file in the **Project** view.

Tip:
You can drag an image from the **Image Preview** view and drop it in a DITA, DocBook, or TEI document.

Loading Large Documents

When you open a document with a file size larger than the limit configured in **Open** preferences *(on page 208)*, Oxygen XML Editor prompts you to choose whether you want to optimize the loading of the document for large files or for huge files.

Figure 88. Large File Prompt Dialog Box



If your file has a size smaller than 300 MB, the recommended approach is **Optimize loading for large files** *(on page 480)*. For documents that exceed 300 MB, the recommended approach is **Optimize loading for huge files** *(on page 481)*.

Optimize Loading for Large Files

If you open a document that exceeds the limit configured in **Open** preferences *(on page 208)* (the default limit is 30 MB), a dialog box will be displayed *(on page 479)* prompting you to choose whether you want to optimize the loading of the document for large files or for huge files. If you choose the **Optimize loading for large files** option (typically recommended for files smaller than 300 MB), a special memory optimization is implemented so that the total memory allocated for the application is not exceeded. A temporary buffer file is created on disk and the available free disk space needs to be at least double the size of the file you want to open.

When opening a large file in this optimized editing environment, some editing features are disabled, including:

- The file can only be opened in **Text** mode.
- The automatic validation is not available.
- The XPath filter is disabled in the Find/Replace dialog box *(on page 442)*.
- The bidirectional Unicode support (right-to-left writing) is disabled.
- The **Format and indent the document on open** option *(on page 210)* is automatically deselected for non-XML documents. For XML documents, the formatting is done while optimizing the memory usage by ignoring the options set in the **Format** preferences page *(on page 210)*.
- Localizations for the results of an XPath expression will be less precise.

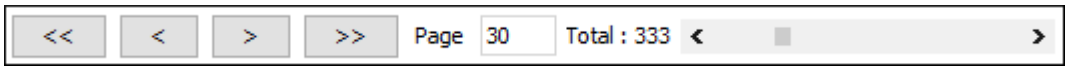
Related information

Optimize Loading for Huge Files *(on page 481)*

Optimize Loading for Huge Files

If you open a document that exceeds the limit configured in **Open** preferences *(on page 208)* (the default limit is 30 MB), a dialog box will be displayed *(on page 479)* prompting you to choose whether you want to optimize the loading of the document for large files or for huge files. If you choose the **Optimize loading for huge files** option (typically recommended for files larger than 300 MB), the file is split in multiple pages (each approximately 1MB in size). Each page is individually loaded (and edited) in **Text** mode by using a special horizontal slider located at the top of the editing area.

Figure 89. Huge File Editor Horizontal Slider



When opening a file in this special huge file editor, some editing features are disabled, including:

- For XML files, the UTF-8, UTF-16, ASCII, Windows-1252, and ISO 8859-1 encodings are supported. No other encoding is supported.
- The file can only be opened in **Text** editing mode.
- The automatic validation is disabled.
- The XPath filter is disabled in the **Find/Replace** dialog box *(on page 442)*.
- The bidirectional Unicode support (right-to-left writing) is disabled.
- The **Format and indent the document on open** option *(on page 210)* is automatically deselected for non-XML documents. For XML documents, the formatting uses less memory by ignoring the options set in the **Format** preferences page *(on page 210)*.
- The **Outline** view is not supported.
- The file content is soft wrapped by default.
- The **Find/Replace** dialog box *(on page 442)* only supports the **Find** action.
- Saving changes is only possible if the **Safe save** option *(on page 209)* (in the **Save** preferences page) is enabled.
- The **undo** operation is not available if you go to other pages and come back to the modified page.

Related information

Optimize Loading for Large Files *(on page 480)*

Documents with Long Lines

When working with documents that contain lines of text that exceed the boundaries of your monitor, you might want to see the text wrapped. To do so, use one of the following methods:

- Press **Ctrl + Shift + Y (Command + Shift + Y on macOS)** to toggle the line wrap feature for the current document only.
- Select the **Line wrap** *(on page 180)* option in the **Text** preferences page to apply the line wrap to all documents.

Features that Might be Affected by Wrapping Lines of Text

Documents that contain thousands of characters per line can affect the performance of Oxygen XML Editor **Text** mode. When a certain line length limit is reached (controlled from the Optimize loading for documents with lines longer than (Characters) *(on page 209)* option), Oxygen XML Editor prompts you to wrap the lines of text. By doing so, the following features may be affected to maintain a reasonable level of productivity:

- The editor uses the `Monospaced` font.
- You cannot set font styles.
- Automatic validation is disabled.
- Automatic spell checking *(on page 466)* is disabled.
- When editing XML documents, the **XPath** field is disabled in the **Find/Replace** dialog box *(on page 442)*.
- Less precise localization for executed XPath expressions in XML documents. The XPath executions use SAX sources for a smaller memory footprint. It is recommended to use XPath 2.0 instead of XPath 1.0 because it features an increased execution speed and uses a smaller memory footprint. Running an XPath expression requires additional memory of about 2 or 3 times the size of the document on disk.

Handling Read-Only Files

If a file marked as read-only is opened in Oxygen XML Editor you can by default perform modifications to it. This behavior is controlled by the **Can edit read only files** option *(on page 177)*. When attempting to save such files you will be prompted to save them to another location.

You can check out the read-only state of the file by looking in the **Properties** view *(on page 407)*. If you modify the file properties from the operating system and the file becomes writable, you can modify it on the spot without having to reopen it.

The read-only state is marked with a lock decoration that appears in the editor tab and specified in the tooltip for a certain tab.

Scratch Buffer

The **Scratch Buffer** view can be used for storing fragments of arbitrary text during the editing process. It can be used to drop bits of paragraphs (including arbitrary XML markup fragments) while rearranging and editing the document and also to drag and drop fragments of text from the Scratch Buffer to the editor panel. The **Scratch Buffer** is basically a text area offering XML syntax highlight. The view's contextual menu contains basic edit actions such as **Cut**, **Copy**, and **Paste**.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Compare Files or Directories

Oxygen XML Editor provides a simple means of performing file and folder comparisons. You can see the differences in your files and folders and merge the changes. You can also use the file comparison to compare fragments or files inside zip-based archives.

There are two types of comparison tools: **Compare Directories** or **Compare Files**. These utilities are available from the **Tools** menu or can be opened as stand-alone applications from the Oxygen XML Editor installation folder (`diffDirs.exe` and `diffFiles.exe`).

Starting the Tools from a Command Line

The comparison tools can also be started by using command-line arguments. In the installation folder there are two executable shells (`diffFiles.bat` and `diffDirs.bat` on Windows, `diffFiles.sh` and `diffDirs.sh` on macOS and Linux). To specify files or directories to compare, you can pass command-line arguments to each of these shells. The arguments can point to file or folder paths in directories or archives (supported formats: *zip*, *docx*, and *xlsx*).

Directory Comparison Example

To start a comparison between the two directories *(on page 504)*, use the following construct:

```
diffDirs.bat/diffDirs.sh [directory path 1] [directory path 2]
```

If you pass only one argument, you are prompted to manually choose the second directory or archive.

For example, to start a comparison between two Windows directories, the command line would look like this:

```
diffDirs.bat "c:\documents new" "c:\documents old"
```

Tip:
If there are spaces in the path names, surround the paths with quotes.

File Comparison Example

To start a comparison between 2 or 3 files *(on page 484)*, use the following construct: `diffFiles.bat/diffFiles.sh [path to left file] [path to right file] [path to base file]`.

If three files are specified, the tool will start in the 3-way comparison mode *(on page 487)*. If only two files are specified, the tool will start in the 2-way comparison mode *(on page 484)*. The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

For example, to do a 3-way comparison on Windows, the command line would look like this:

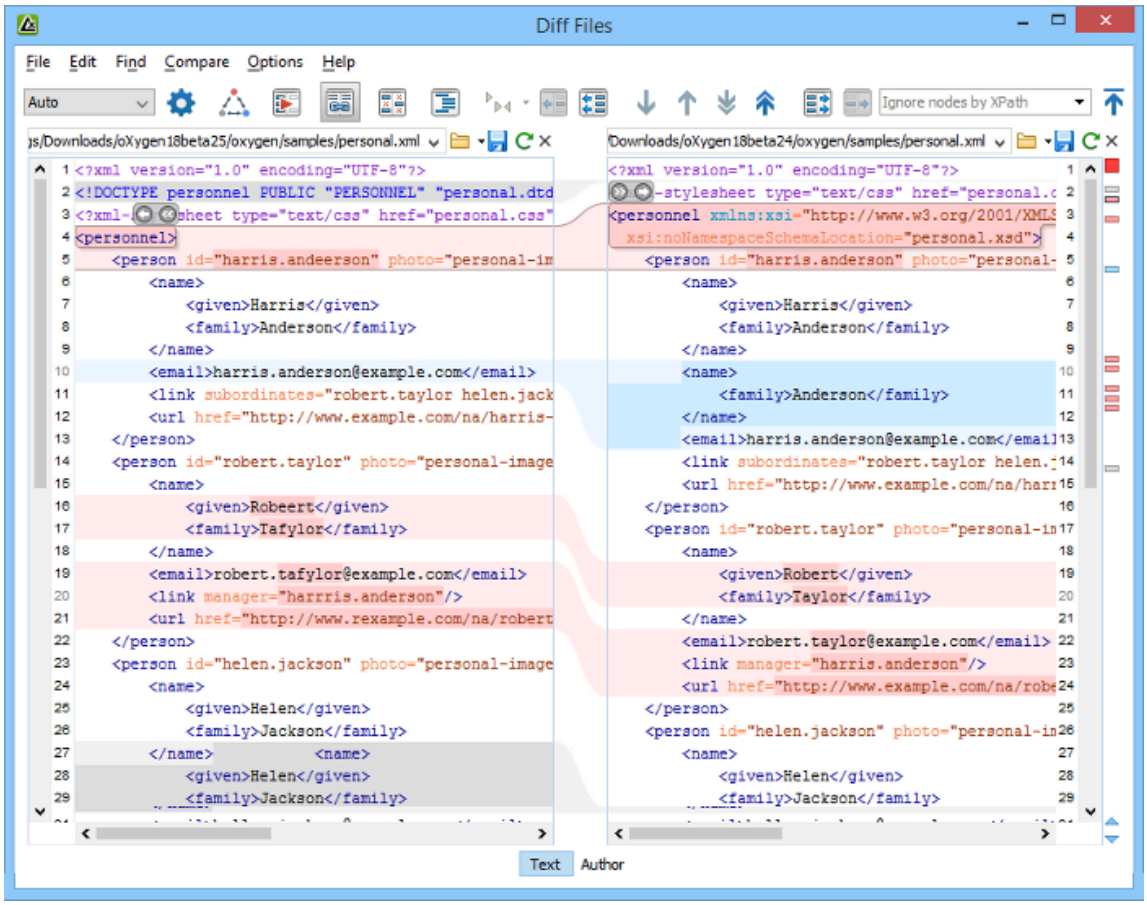
```
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```

Tip:
If there are spaces in the path names, surround the paths with quotes.

Compare Files Tool

The built-in **Compare Files** tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison. The utility is available from the **Tools > Comparison Tools** menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (`diffFiles.exe`).

Figure 90. Compare Files Tool



Two-Way Comparisons

The **Compare Files** tool can be used to compare the differences between two files or XML fragments.

Compare Files

To perform a two-way comparison, follow these steps:

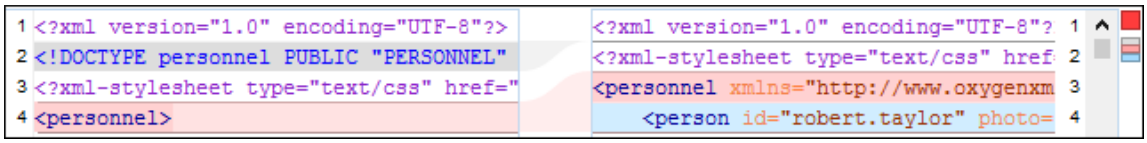
1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down menu.

   Step Result: The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. To highlight the differences between the two files, click the **Perform File Differencing** button from the toolbar.
3. You can use the drop-down menu on the left side of the toolbar to change the algorithm *(on page 486)* for the operation.
4. You can also use the **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.
5. If you are comparing XML documents using the **XML Fast** or **XML Accurate** algorithms, you can enter an XPath 2.0 expression in the **Ignore nodes by XPath** text field to ignore certain nodes from the comparison.

The resulting comparison will show you differences between the two files. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes. This layout allows you to easily identify and focus on a group of related changes.

Figure 91. Two-Way Differences



Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the **Files Comparison / Appearance** preferences page *(on page 297)*, but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Comparing Fragments (Copy/Paste)

To compare XML file fragments, you need to copy and paste the fragments you want to compare into each side, without selecting a file. If a file is already selected, you need to close it using the **Close (Ctrl + W (Command + W on macOS))** button, before pasting the fragments. Other notes for pasting fragments:

- As long as the fragment is more than 10 characters, the application will attempt to automatically detect the content type. It can detect the following types: XML, DTD, CSS, JSON, and Markdown (if it starts with #). If one of those content types is detected, the fragments will be displayed with syntax highlights.
- If you save modified fragments, a dialog box opens that allows you to save the changes as a new document.

Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the  **Perform File Differencing** button.

A variety of actions are available on the toolbar *(on page 496)* and in the various menus *(on page 500)* (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

 **Append left change to right and**  **Append right change to left**

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

 **Copy change from left to right and**  **Copy change from right to left**

Replaces the content of a change from one side with the content of the corresponding change from the other side.

 **Remove change**

Rejects the change on the particular side and preserves the particular content on the other side.

Two-Way Diff Algorithms

Oxygen XML Editor offers the following two-way diff algorithms to compare files or fragments:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** comparison mode.

- **Syntax Aware** - Computes differences for known file types or fragments. This algorithm splits the files or fragments into sequences of *tokens* and computes the differences between them. The meaning of a *token* depends on the type of compared files or fragments.

  Known file types include those listed in the **New** dialog box, such as XML file types (XSLT files, XSL-FO files, XSD files, RNG files, NVDL files, etc.), XQuery file types (`.xquery`, `.xq`, `.xqy`, `.xqm` extensions), DTD file types (`.dtd`, `.ent`, `.mod` extensions), TEXT file type (`.txt` extension), or PHP file type (`.php` extension).

  For example:
  - When comparing XML files or fragments, a token can be one of the following:
    - The name of an XML tag
    - The **<** character
    - The **/>** sequence of characters
    - The name of an attribute inside an XML tag
    - The **=** sign
    - The " character
    - An attribute value
    - The text string between the start tag and the end tag (a text node that is a child of the XML element corresponding to the XML tag that encloses the text string)
  - When comparing plain text, a token can be any continuous sequence of characters or any continuous sequence of whitespaces, including a new line character.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

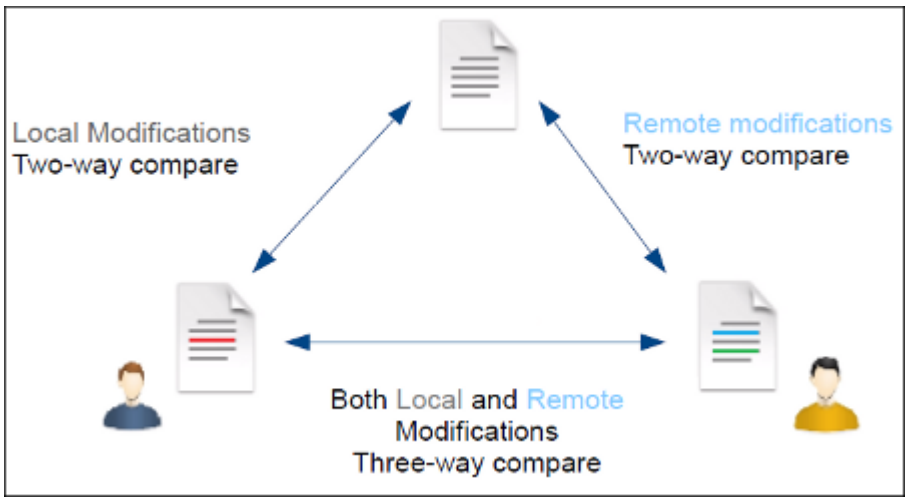
Three-Way Comparisons

Oxygen XML Editor also includes a three-way comparison feature to help you solve conflicts and merge changes between multiple modifications. It is especially helpful for teams who have multiple authors editing

and committing the same documents. It provides a comparison between a local change, another change, and the original base revision. Some additional advantages include:

- Visualize and merge content that was modified by you and another member of your team.
- Marks differences correctly even when the document structure is rearranged.
- Allows you to merge XML-relevant modifications.

Figure 92. Three-Way Comparison



Compare Files

To perform a three-way comparison, follow these steps:

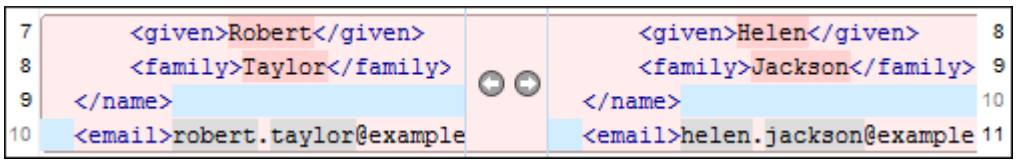
1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down menu.

   Step Result: The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. Click the **Three-Way Comparison** button on the toolbar and select the base (original) file in the **Base** field. You can specify the path by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down menu.
3. To highlight the differences, click the **Perform File Differencing** button on the toolbar.
4. You can use the drop-down menu on the left side of the toolbar to change the algorithm *(on page 486)* for the operation.
5. You can also use the **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.

The resulting comparison will show you differences between the two files, as well as differences between either of them and the base (original) file. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

Figure 93. Three-Way Differences



Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the **Files Comparison / Appearance** preferences page *(on page 297)*, but the default colors and their shades mean the following:

- **Pink** - Identifies blocks of changes that include conflicts.
- **Gray** - Identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies incoming changes that do not include conflicts.
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the **Perform File Differencing** button.

A variety of actions are available on the toolbar *(on page 496)* and in the various menus *(on page 500)* (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

Append left change to right and **Append right change to left**

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

Copy change from left to right and **Copy change from right to left**

Replaces the content of a change from one side with the content of the corresponding change from the other side.

Remove change

Rejects the change on the particular side and preserves the particular content on the other side.

Three-Way Diff Algorithms

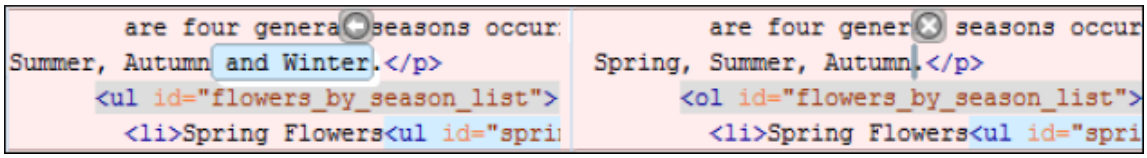
Oxygen XML Editor offers the following three-way diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Second-Level Comparisons

For both two-way and three-way comparisons, Oxygen XML Editor automatically performs a second-level comparison for the **Lines**, **XML Fast**, and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparison for the **Lines** algorithm is processed on text nodes using a word level comparison, meaning that it looks for identical words. For the **XML Fast** and **XML Accurate** algorithms, the second-level comparison is processed using a syntax-aware comparison *(on page 487)*, meaning that it looks for identical *tokens*. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

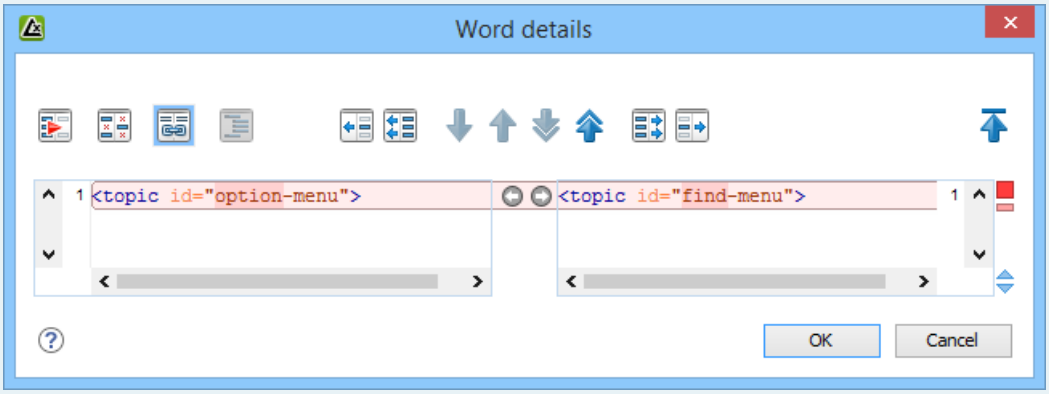
Figure 94. Second-Level Diff Comparison



Note:
If a modified text fragment contains XML markup (such as processing instructions, XML comments, CData, or elements), the second-level comparison will not automatically be performed. In this case you can manually select a second-level comparison by doing a word level or character level comparison.

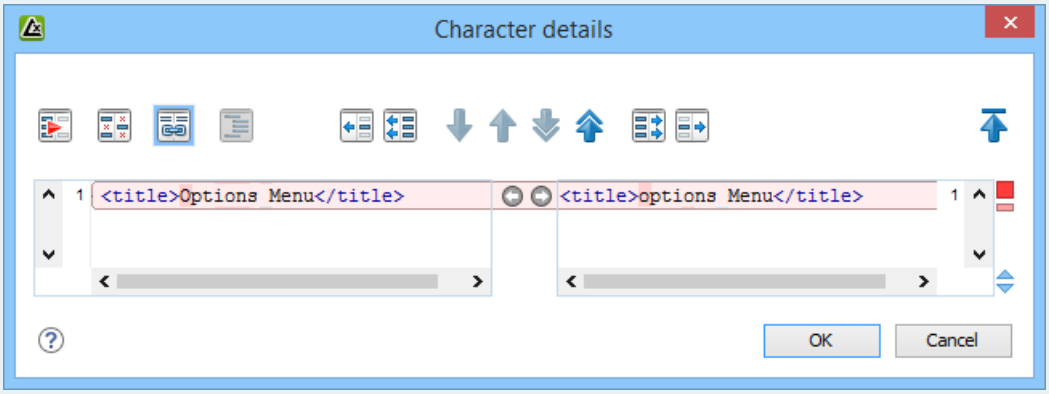
To do a word level comparison, select **Show word level details** from the contextual menu or **Compare** menu.

Figure 95. Word Level Comparison



To do a character level comparison, select **Show Character Level details** from the contextual menu or **Compare** menu.

Figure 96. Character Level Comparison



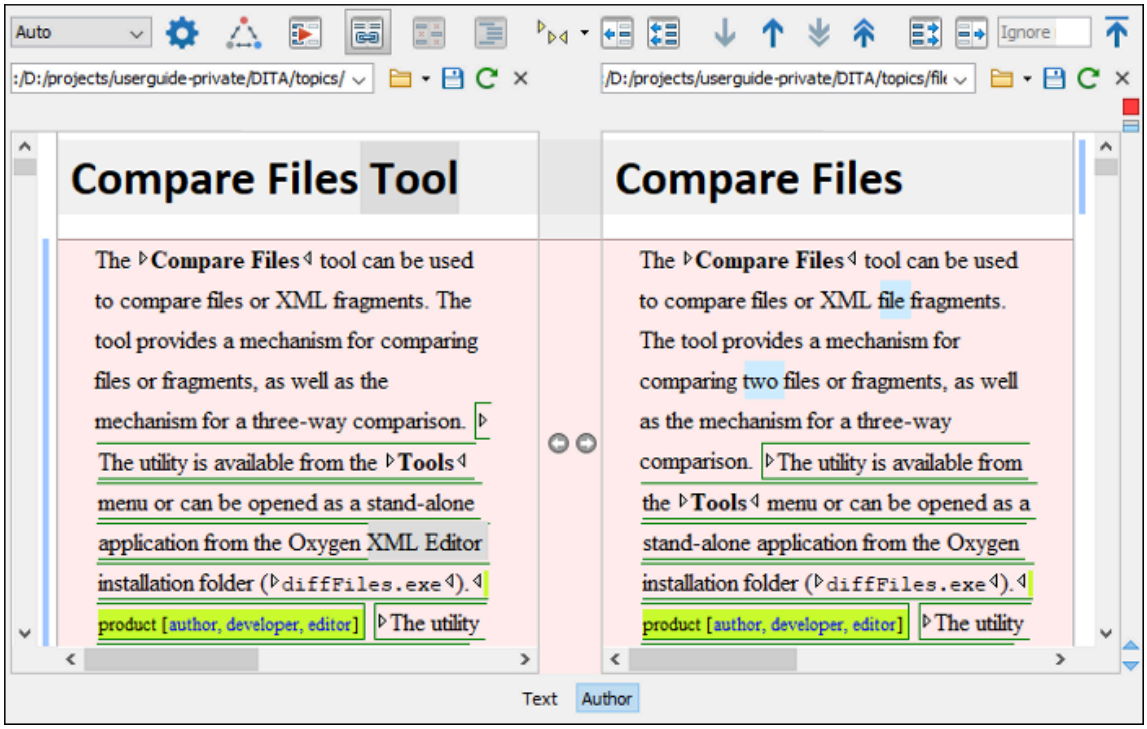
Author Visual Mode

The **Compare Files** tool includes an **Author** comparison mode that displays the files in a visual mode similar to the **Author** editing mode in *Oxygen XML Editor/Author*. This makes it easier to see how the compared changes will look in the final output. This visual mode is available when the compared files are detected as being XML. To determine whether the files are initially opened in the merge tool's **Text** or **Author** comparison mode, it detects the **Initial Edit Mode** in the *Document Type Association* configuration *(on page 149)* and the mode the files were last opened in *Oxygen XML Editor/Author*.

Note:
This mode is not available if the **Enable file comparison in Author mode** option *(on page 295)* is not selected in the **Diff > Files Comparison** preferences page.

This visual mode includes unique features such as a **Tags Display Mode** drop-down button *(on page 498)* on the toolbar that allows you to select the amount of tags to display in this visual mode. This mode also presents differences that were made using the **Track Changes** feature (although the **Track Changes** feature is not available in the comparison tool).

Figure 97. File Comparison Tool - Author Mode



Author Mode Algorithms

The visual **Author** comparison mode offers the following diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Author Mode Second-Level Comparisons

The visual **Author** comparison mode automatically performs a second-level comparison for the **XML Fast** and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparisons is processed on text nodes using a word-level comparison, meaning that it looks for identical words. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

Files Comparison Preferences Page *(on page 295)*
Compare Directories Tool *(on page 504)*

Starting File Comparison Tool from a Command Line

The file comparison tool can be started by using command-line arguments. In the installation folder there is an executable shell (`diffFiles.bat` on Windows, `diffFiles.sh` on macOS and Linux). To specify the files to

compare, you can pass command-line arguments using the following construct: `diffFiles.bat/diffFiles.sh [path to left file] [path to right file] [path to 3-way base file]`.

If three files are specified, the tool will start in the 3-way comparison mode *(on page 487)*. If only two files are specified, the tool will start in the 2-way comparison mode *(on page 484)*. The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

If you want to launch the file comparison tool from an external application with specified files and you want the file browsing buttons at the top of both panels to be hidden, you should use the `-ext` argument as the first command. There are some additional arguments that are allowed and to see all the details for the command-line construct, type `diffFiles.bat --help` in the command line.

Example:

To do a 3-way comparison, the command line might look like this:

Windows

```
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```

> **Tip:**
> If there are spaces in the path names, surround the paths with quotes.

Linux

```
diffFiles.sh home/file1 home/file2 home/basefile
```

macOS

```
diffFiles.sh documents/file1 documents/file2 documents/basefile
```

How to Integrate the File Comparison Tool with Git

The file comparison tool can be integrated with Git clients. It requires that you configure your `.gitconfig` file and then you can simply start the tool from the command line.

To integrate the **Compare Files** tool with your Git client, follow this procedure:

1. Use one of the following methods to instruct your Git client to use the *Oxygen* **Compare Files** tool:
   - **Manual Configuration** - Locate your Git user-specific configuration file (`.gitconfig`) and edit it with a text editor (for example, in Windows, the `.gitconfig` file is most likely located in your user home directory). Add (or replace) the following lines:

```
[diff]
    tool = oxygendiff
[merge]
    tool = oxygendiff
```

```
[difftool "oxygendiff"]
    cmd = '[pathToOxygenInstallDir]/diffFiles.exe' -ext $REMOTE $LOCAL $LOCAL
[mergetool "oxygendiff"]
    cmd = '[pathToOxygenInstallDir]/diffFiles.exe' -ext $LOCAL $REMOTE $BASE $MERGED
    trustExitCode = true
[difftool]
    prompt = false
```

Note:
For macOS, the **cmd** lines would start with something like: **sh "/Applications/Oxygen XML Editor/diffFiles.sh"**. For Linux, the **cmd** lines would start with something like: **sh "/Oxygen XML Editor/diffFiles.sh"**.

Tip:
On Redhat 7, the following command would work, where the whole command is quoted and then inside that, the path to `diffFiles.sh` is quoted:

```
[difftool "oxygendiff"]
   cmd = '"/home/user/Oxygen XML Editor 21/diffFiles.sh"' -ext $REMOTE $LOCAL
 $LOCAL
[mergetool "oxygendiff"]
   cmd = '"/home/user/Oxygen XML Editor 21/diffFiles.sh"' -ext $LOCAL $REMOTE
 $BASE
        $MERGED trustExitCode = true
```

- **Command Line Configuration** - To automatically configure the `.gitconfig` file, you can run the following commands from a command line:

```
git config --global diff.tool oxygendiff
git config --global difftool.oxygendiff.cmd '[Oxygen install dir]/diffFiles.exe -ext
$REMOTE $LOCAL $LOCAL'
git config --global merge.tool oxygendiff
git config --global mergetool.oxygendiff.cmd '[Oxygen install dir]/diffFiles.exe
-ext $LOCAL $REMOTE $BASE $MERGED'
git config --global mergetool.oxygendiff.trustExitCode true
```

Note:
For macOS, the *Oxygen* file comparison tool would be specified in the second and fourth commands with something like: **sh "/Applications/Oxygen XML Editor/diffFiles.sh"**. For Linux, it would be something like: **sh "/Oxygen XML Editor/diffFiles.sh"**.

2. To start the **Compare Files** tool and see a comparison of changes for a particular file, run the following command from a command line:

```
git difftool [PathToFile]
```

Tip:
If the file you want to compare has conflicts, you can start the **Compare Files** tool as a *merge conflict resolution* tool by running the following command:

```
git mergetool [PathToFile]
```

For more information about the Git *difftool* syntax, see https://git-scm.com/docs/git-difftool.

For more information about the Git *mergetool* syntax, see https://git-scm.com/docs/git-mergetool.

How to Integrate the File Comparison Tool with Sourcetree

The file comparison tool can be integrated with Sourcetree so that you can use it to compare changes. The advantages of doing this include:

- The *Oxygen* **Compare Files** tool presents the files side-by-side and makes it much easier to determine real changes.
- The *Oxygen* **Compare Files** tool includes XML comparison algorithms.
- The *Oxygen* **Compare Files** tool includes various options for configuring the comparison.
- The *Oxygen* **Compare Files** tool allows you to navigate through changes.

To integrate the **Compare Files** tool with Sourcetree, follow this procedure, depending on your operating system:

Windows

1. In Sourcetree, go to **Tools > Options**.
2. Go to the **Diff** tab.
3. In the **External Diff/Merge** section, configure the settings as follows:
   - **External Diff Tool** - Select **Custom**.
   - **Diff Command** - Enter the path of the *Oxygen* `diffFiles.exe` file (for example: `c:\Programs\Oxygen XML Editor\diffFiles.exe`).
   - **Arguments** - Enter **-ext $REMOTE $LOCAL $LOCAL**.
   - **Merge Tool** - Select **Custom**.
   - **Diff Command** - Enter the path of the *Oxygen* `diffFiles.exe` file (for example: `c:\Programs\Oxygen XML Editor\diffFiles.exe`).
   - **Arguments** - Enter **-ext $LOCAL $REMOTE $BASE $MERGED**.
4. Click **OK**.

Result: In Sourcetree, you can now compare file changes with the *Oxygen* **Compare Files** tool by simply selecting **External Diff** from the contextual menu, **Actions** menu, or **Ctrl+D**.

macOS

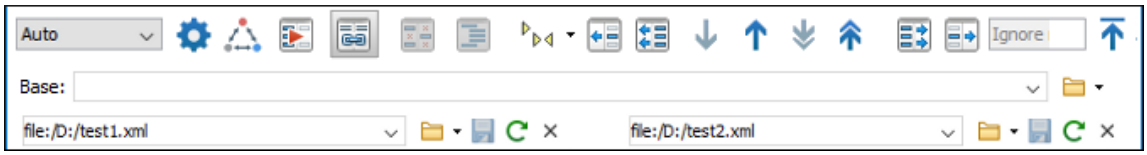
1. In Sourcetree, go to **Sourcetree > Preferences**.
2. Go to the **Diff** tab.
3. In the **External Diff/Merge** section, configure the settings as follows:
   - **External Diff Tool** - Select **Custom**.
   - **Diff Command** - Enter a command-line argument to launch the *Oxygen* `diffFiles.sh` file (for example: **sh "/Applications/Oxygen XML Editor/diffFiles.sh"**).
   - **Arguments** - Enter **-ext $REMOTE $LOCAL $LOCAL**.
   - **Merge Tool** - Select **Custom**.
   - **Diff Command** - Enter a command-line argument to launch the *Oxygen* `diffFiles.sh` file (for example: **sh "/Applications/Oxygen XML Editor/diffFiles.sh"**).
   - **Arguments** - Enter **-ext $LOCAL $REMOTE $BASE $MERGED**.
4. Close the preferences dialog box.

Result: In Sourcetree, you can now compare file changes with the *Oxygen* **Compare Files** tool by simply selecting **External Diff** from the contextual menu or **Actions** menu.

Toolbar and Contextual Menu Actions of the Compare Files Tool

The toolbar of the **Compare Files** tool contains operations that can be performed on the source and target files or XML fragments. Many of the actions are also available in the contextual menu.

Figure 98. Compare Toolbar



The following actions are available:

Algorithm

This drop-down menu allows you to select one of the following diff algorithms (depending on whether it is a two-way or three-way comparison):

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in **Author** comparison mode.

- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Editor, taking the syntax (the specific types of tokens) into consideration. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

 **Diff Options**

Opens the **Files Comparison** preferences page *(on page 295)* where you can configure various options.

 **Three-Way Comparison**

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

 **Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.

 **Synchronized scrolling**

Toggles synchronized scrolling on or off so that a selected difference can be seen on both sides of the application window. This option is on by default.

 **Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces. This option is not available when in the **Author** comparison mode.

 **Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on macOS))**

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences. This option is not available when in the **Author** comparison mode.

Note:
When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

Tags Display Mode

Allows you to select the amount of markup to be displayed in the **Author** visual comparison mode *(on page 491)*. You can choose between: **Full Tags with Attributes**, **Full Tags**, **Block Tags**, **Block Tags without Element Names**, **Inline Tags**, **Partial Tags**, or **No Tags**.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (Ctrl + Period (Command + Period on macOS))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

> **Note:**
> A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

Copy All Changes from Left to Right

Copies all changes from the file in the left panel to the file in the right panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Ignore Nodes by XPath

You can use this text field to enter an XPath expression *(on page 2117)* to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name

of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter `@id`). This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms.

> **Note:**
> If an XPath expression is specified in the **Ignore nodes by XPath** option *(on page 297)* in the **Diff / File Comparison** preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

First Change (Ctrl + B (Command + B on macOS))

Jumps to the first change.

Base

Available for three-way comparisons *(on page 487)*. It is the base file that will be compared with the files opened in the left and right editors. You can specify the path to the file by using the text field, its history drop-down, or the browsing actions in the **Browse** drop-down menu.

Left-Side (Source) File

You can specify the path to the file to be compared on the left side (source) by using the text field, its history drop-down, or the browsing actions in the **Browse** drop-down menu.

Save

Saves the changes made in the source (left-side) file.

Reload

Reloads the source (left-side) file.

Close

Closes the source (left-side) file.

Right-Side (Target) File

You can specify the path to the file to be compared on the right side (target) by using the text field, its history drop-down, or the browsing actions in the **Browse** drop-down menu.

Save

Saves the target (right-side) file.

Reload

Reloads the target (right-side) file.

Close

Closes the target (right-side) file.

Compare Files Tool Menus

The menus in the **Compare Files** tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

File Menu

Source > Open

Browses for a file that will be displayed in the left panel.

Source > Open URL

Browses for a remote file that will be displayed in the left panel.

Source > Open File from Archive

Browses an archive for a file that will be displayed in the left panel.

Source > Reload

Reloads the file in the left panel.

Source > Save

Saves the changes made to the file in the left panel.

Source > Save As

Allows you to choose a destination to save the file in the left panel.

Source > Close

Closes the file in the left panel.

Target > Open

Browses for a file that will be displayed in the right panel.

Target > Open URL

Browses for a remote file that will be displayed in the right panel.

Target > Open File from Archive

Browses an archive for a file that will be displayed in the right panel.

Target > Reload

Reloads the file in the right panel.

Target > Save

Saves the changes made to the file in the right panel.

Target > Save As

Allows you to choose a destination to save the file in the right panel.

Target > Close

Closes the file in the right panel.

Base > Open

Browses for a file that will be compared with both files in a three-way comparison *(on page 487)*.

Base > Open URL

Browses for a remote file that will be compared with both files in a three-way comparison *(on page 487)*.

Base > Open File from Archive

Browses an archive for a file that will be compared with both files in a three-way comparison *(on page 487)*.

Save Results as HTML (Available in Text mode only)

Generates an HTML file that contains detailed information about the comparison result. See an example of what the generated report look like in the Generate HTML Report for Directory Comparison topic *(on page 521)*.

Save Comparison as Document with Tracked Changes (Available for two-way comparison in Author mode only)

Allows you to merge two compared documents based on the differences detected and save the results as a specified file that includes the special change tracking marks. You can load the resulting file in **Oxygen's Author** mode to review the changes that resulted from the merge process and you can accept or reject them. Note that if the documents to be compared already contain tracked changes, they will be automatically accepted before generating the output file.

Close (Ctrl + W (Command + W on macOS))

Closes the application.

Edit Menu

Cut

Cut the selection from the currently focused editor panel to the clipboard.

Copy

Copy the selection from the currently focused editor panel to the clipboard.

Paste

Paste content from the clipboard into the currently focused editor panel.

Select all

Selects all content in the currently focused editor panel.

Undo

Undo changes in the currently focused editor panel.

Redo

Redo changes in the currently focused editor panel.

Find Menu

Find/Replace

Perform *find/replace* operations in the currently focused editor panel.

Find Next

Go to the next match using the same options as the last *find* operation. This action runs in both editor panels.

Find Previous

Go to the previous match using the same options as the last *find* operation. This action runs in both editor panels.

Compare Menu

Three-Way Comparison

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Next Block of Changes (Ctrl + Period (Command + Period on macOS))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

> **Note:**
> A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

Last Change (Ctrl + E (Command + E on macOS))

Jumps to the last change.

First Change (Ctrl + B (Command + B on macOS))

Jumps to the first change.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Copy All Changes from Left to Right

Copies all changes from the file in the left panel to the file in the right panel.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Show Word Level Details

Provides a word-level comparison of the selected change.

Show Character Level Details

Provides a character-level comparison of the selected change.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on macOS))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note:
When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

Options Menu

Preferences

Opens the preferences dialog box that includes numerous pages of options that can be configured.

Menu Shortcut Keys

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

Reset Global Options

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

Import Global Options

Allows you to import an options set that you have previously exported.

Export Global Options

Allows you to export the current options set to a file.

Help Menu

Help (F1)

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

Use Online Help

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

Report problem

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

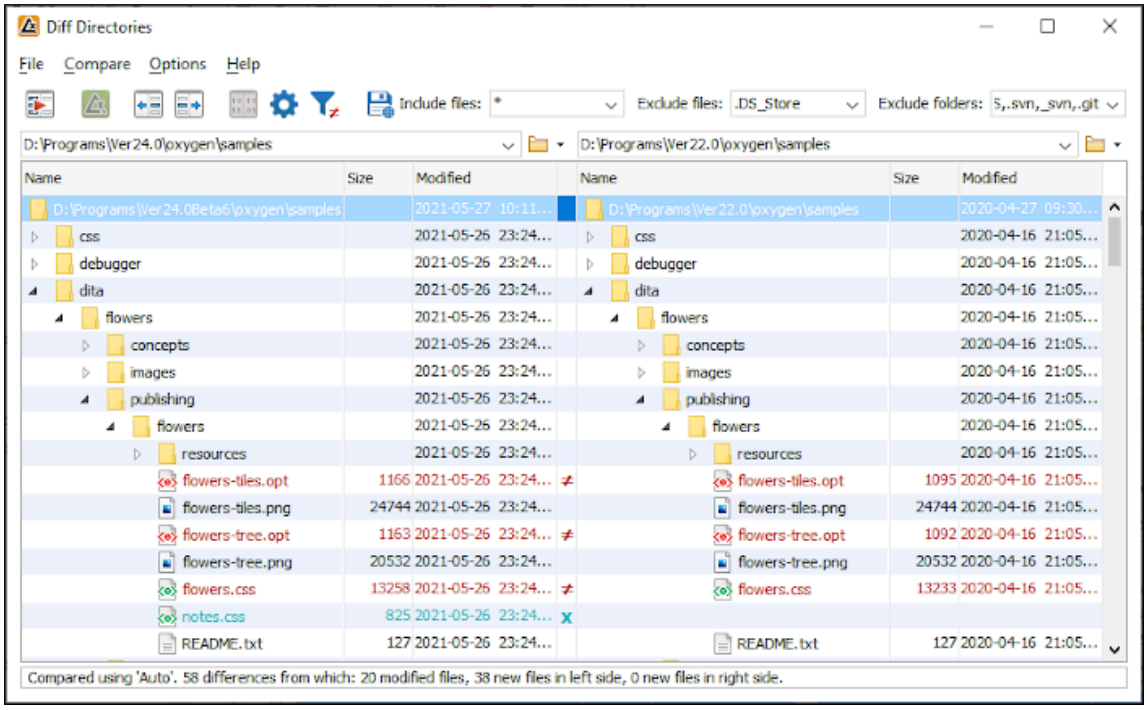
Support Center

Opens the Oxygen XML Editor Support Center web page in a browser.

Compare Directories Tool

The **Compare Directories** tool can be used to compare and manage changes to files and folders within the structure of your directories. The utility is available from the **Tools > Comparison Tools** menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (`diffDirs.exe`).

Figure 99. Diff Directories Dialog Box



Starting the Tool from a Command Line

The directory comparison tool can also be started by using command-line arguments. In the installation folder there is an executable shell (`diffDirs.bat` on Windows, `diffDirs.sh` on macOS and Linux). To specify the directories to compare, you can pass command-line arguments using the following construct: `diffDirs.bat/diffDirs.sh [directory path 1] [directory path 2]`.

If you pass only one argument, you are prompted to manually choose the second directory or archive.

Example:

To do a comparison between two directories, the command line would look like this:

Windows

```
diffDirs.bat "c:\documents new" "c:\documents old"
```

Tip:
If there are spaces in the path names, surround the paths with quotes.

Linux

```
diffDirs.sh home/documents1 home/documents2
```

macOS

```
diffDirs.sh documents1 documents2
```

Directory Comparisons

To perform a directory comparison, follow these steps:

1. Select a folder in the left panel and the folder you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the **Browse for local directory** action in the **Browse** drop-down menu.

   Step Result: The selected directory structures are opened in the two side-by-side panels.
2. To highlight the differences between the two folders, click the **Perform Directories Differencing** button from the toolbar.
3. You can also use the **Diff Options** button to access the **Directories Comparison** preferences page *(on page 298)* where you can configure various options.

To compare the content of two archives, follow these steps:

1. Use the **Browse for archive file** action in the **Browse** drop-down menu to select the archives in the left and right panels.
2. By default, the supported archives are not treated as directories and the comparison is not performed on the files inside them. To make Oxygen XML Editor treat supported archives as directories, select the **Look in archives** option *(on page 299)* in the **Directories Comparison** preferences page.
3. To highlight the differences, click the **Perform Directories Differencing** button from the toolbar.

The directory comparison results are presented using two tree-like structures showing the files and folders, including their name, size, and modification date. A column that contains graphic symbols separates the two tree-like structures. The graphic symbols can be one of the following:

- An **X** symbol, when a file or a folder exists in only one of the compared directories.
- A ≠symbol, when a file exists in both directories but the content differs. The same sign appears when a collapsed folder contains differing files.

The color used for the symbol and the directory or file name can be customized in the **Directories Comparison / Appearance** preferences page *(on page 299)*. You can double-click lines marked with the ≠ symbol to open a **Compare Files** window, which shows the differences between the two files.

The directories that contain files that differ are expanded automatically so that you can focus directly on the differences. You can merge the contents of the directories by using the copy actions. If you double-click (or press **Enter**) on a line with a pair of files, Oxygen XML Editor starts a file comparison *(on page 484)* between the two files, using the **Compare Files** tool.

Toolbar and Contextual Menu Actions of the Compare Directories Tool

The toolbar of the **Compare Directories** tool contains operations that can be performed on the compared directory structure. Some of the toolbar actions are also available in the contextual menu.

Figure 100. Compare toolbar

Toolbar Actions

Perform Directories Differencing

Looks for differences between the two directories displayed in the left and right side of the application window.

Perform Files Differencing

Opens the **Compare Files** tool *(on page 484)* that allows you to compare the currently selected files.

Copy Change from Right to Left

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

Copy Change from Left to Right

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

Binary Compare

Performs a byte-level comparison on the selected files.

Diff Options

Opens the **Directory Comparison** preferences page *(on page 298)* where you can configure various options.

Show Only Modifications

Displays a more uncluttered file structure by hiding all identical files.

Save Results as HTML

Generates an HTML file that contains detailed information about the comparison result.

File and folder filters

Differences can be filtered using three combo boxes: **Include files**, **Exclude files**, and **Exclude folders**. They come with predefined values and are editable to allow custom values. All of them accept multiple comma-separated values and the ***** and **?** wildcards. For example, to filter out

all `JPEG` and `GIF` image files, edit the **Exclude files** filter box to read `*.jpeg`, `*.png`. Each filter includes a drop-down menu with the latest 15 filters applied.

Contextual Menu Actions

Perform Files Differencing

Opens the **Compare Files** tool *(on page 484)* that allows you to compare the currently selected files.

Binary Compare

Performs a byte-level comparison on the selected files.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Open

If the action is invoked on a file, the selected file is opened in Oxygen XML Editor. If the action is invoked on a directory, the selected directory is opened in the default file browser for your particular operating system.

Open in System Application

Opens the selected file in the system application that is associated with that type of file. The action is available when launching the **Compare Directories** tool from the **Tools** menu in Oxygen XML Editor.

Show in Explorer

Opens the default file browser for your particular operating system with the selected file highlighted.

Compare Directories Tool Menus

The menus in the **Compare Directories** tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

File Menu

Save Results as HTML

Generates an HTML file that contains detailed information about the comparison result. See an example of what the generated report look like in the Generate HTML Report for Directory Comparison topic *(on page 521)*.

Close (Ctrl + W (Command + W on macOS))

Closes the application.

Compare Menu

 **Perform Directories Differencing**

Looks for differences between the two directories displayed in the left and right side of the application window.

 **Perform Files Differencing**

Opens the **Compare Files** tool *(on page 484)* that allows you to compare the currently selected files.

 **Copy Change from Right to Left**

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

 **Copy Change from Left to Right**

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

Options Menu

Preferences

Opens the preferences dialog box that includes numerous pages of options that can be configured.

Menu Shortcut Keys

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

Reset Global Options

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

Import Global Options

Allows you to import an options set that you have previously exported.

Export Global Options

Allows you to export the current options set to a file.

Help Menu

Help (F1)

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

Use Online Help

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

Report problem

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

Support Center

Opens the Oxygen XML Editor Support Center web page in a browser.

Compare Images

You can use the **Compare Directories** tool to compare images. If you double-click a line that contains two different images, the **Compare images** window is displayed. This dialog box presents the images in the left and right sides, scaled to fit the available view area. You can use the contextual menu actions to scale the images to their original size or scale them down to fit in the view area.

The supported image types are: *GIF*, *JPG*, *JPEG*, *PNG*, and *BMP*.

Compare Directories Against a Base (3-Way) Tool

The **Compare Directories Against a Base (3-way)** tool allows you to perform three-way comparisons on directories to help you identify and merge changes between multiple modifications of the same directory structure. It is especially helpful for teams that have multiple authors contributing documents to the same directory system. It offers information about conflicts and changes, and includes actions to easily merge, accept, overwrite, or ignore changes to the directory system.

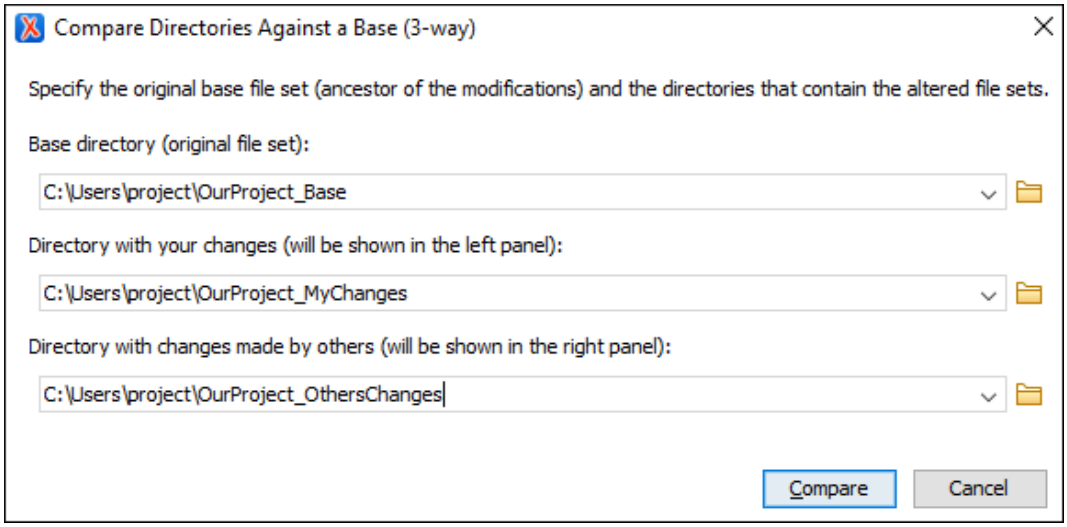
How to Perform 3-Way Directory Comparisons

To perform a 3-way directories comparison, follow these steps:

1. Select **Compare Directories Against a Base (3-way)** from the **Tools > Comparison Tools** menu.

   Step Result: This opens a dialog box that allows you to select the 3 file sets that will be used for the comparison.

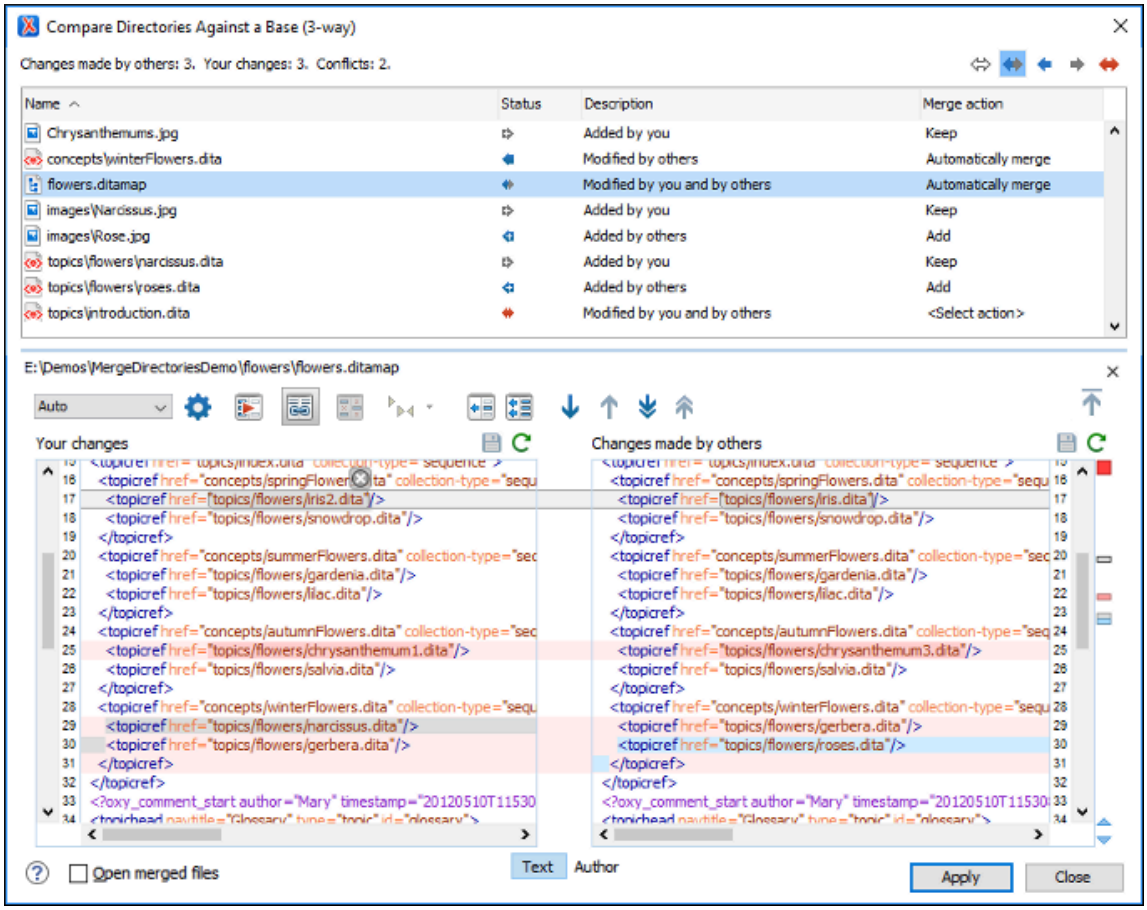
Figure 101. Compare Directories Against a Base File Set Chooser



2. Select the file sets to be compared:
   - **Base directory** - This is the original (base) file set before any modifications were made by you or others.
   - **Directory with your changes** - This is the file set with changes that you have made. This file set will be displayed in the left panel in the comparison tool.
   - **Directory with changes made by others** - This is the file set with changes made by others that you want to merge with your changes. This file set will be displayed in the right panel in the comparison tool.
3. Click the **Compare** button to compare the file sets and open the comparison and merge tool.
4. Use the features and actions described in the next section to identify and merge the changes.

3-Way Directory Comparison and Merge Tool

Figure 102. Comparison and Merge Tool



The 3-way directory comparison and merge tool includes the following information, features, and actions:

Number of Changes and Conflicts

The first thing you see in the top-left corner of the tool is the grand total of all the changes made by others, changes made by you, and the number of conflicts.

Filter Buttons

In the top-right corner you can use the toggle buttons to filter the list of modifications:

Show all files

Use this button to show all modified and unmodified files, as well as conflicts.

Show only files modified by you and others

Filters the list to show all files that have been modified, including conflicts.

Show only files modified by others

Filters the list to only show the files that were modified by others.

Show only files modified by you

Filters the list to only show the files that were modified by you.

Show only conflicting files

Filters the list to only show files that contain conflicts.

List of Files Panel

This panel shows the list of files in the compared file sets based upon the filter button that is selected. This panel includes the following sortable columns:

- **Name** - The file names.
- **Status** - An icon that represents the file status. Red icons indicate some sort of conflict. Gray icons indicate modifications made by you. Blue icons indicate modifications made by others.
- **Description** - A description of the file status.
- **Merge Action** - This column provides a drop-down menu for each file that allows you to choose some merge actions depending upon its status. A default action is always set to **Automatically merge** the changes made by others with your changes. If there is a conflict, the default is **<Select action>** and you are required to make a selection. Click this column to access the drop-down menu where you can make a selection. The same actions are available in the contextual menu.

Tip:
If the solution proposed in the **Merge Action** column for any particular file is not satisfactory, you can change it directly in that column (even if that file is not selected) without automatically re-triggering the comparison (except for in certain cases where re-triggering the comparison is necessary).

You can click a file to open it in the file comparison panel (the file from your file set is shown in the left panel while the file from the file set with changes made by others is shown in the right panel). For image files, the comparison panel shows a preview of the image. For other binary files, a preview is not available and you will just see its status.

File Comparison Panels

If you click a file in the top panel, the file is opened in this file comparison section. The file from your file set is shown in the left panel and the file from the other file set is shown in the right panel.

Note:
If Oxygen XML Editor does not recognize the file type, a dialog box will be displayed that allows you to select the type of editor you want it to be associated with for this comparison (if you want Oxygen XML Editor to remember this association, you can select the **Associate file type with editor** option at the bottom of the dialog box).

This panel includes the following information and toolbar actions:

File Path

The first thing you see in this panel is the file path where merge actions will be applied if you make changes.

Close

Closes the file comparison panel.

Algorithm Drop-down Menu

This drop-down menu allows you to select one of the following diff algorithms to be used for file comparisons:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Diff Options

Opens the **Files Comparison** preferences page *(on page 295)* where you can configure various options.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Synchronized scrolling

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces. This option is not available when the file comparison is in **Author** mode.

Tags Display Mode

Allows you to select the amount of markup to be displayed in the **Author** visual mode. You can choose between: **Full Tags with Attributes**, **Full Tags**,

Block Tags, **Block Tags without Element Names**, **Inline Tags**, **Partial Tags**, or **No Tags**.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (Ctrl + Period (Command + Period on macOS))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

> **Note:**
> A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

First Change (Ctrl + B (Command + B on macOS))

Jumps to the first change.

Left-Side File (Your changes)

Above the panel you can see the file path and the following two buttons:

Save

Saves changes made to the file.

Reload

Reloads the file.

Right-Side File (Changes made by others)

Above the panel you can see the file path and the following two buttons:

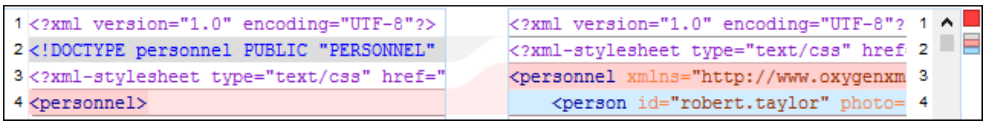
Reload

Reloads the file.

Displaying Changes in the File Comparison Panels

The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

Figure 103. File Comparison Panels



The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the **Files Comparison / Appearance** preferences page *(on page 297)*, but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Direct Editing Actions in the File Comparison Panels

In addition to selecting merge actions from the drop-down menus in the **Merge Action** column in the top panel, you can also edit the files directly in the left pane (your local changes). The two editors are constantly synchronized and the differences are refreshed when you save the modified document (**Save** button or **Ctrl+S**) or when you click the **Perform File Differencing** button.

A variety of actions are available in the contextual menu in both editing panes. The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

Append right change to left

Copies the content of the selected change from the right side and appends it on the left side.

Copy change from right to left

Replaces the content of a change in the left side with the content of the change in the right side.

Remove change

Removes the change from the left side.

Anytime you save manual changes (**Save** button or **Ctrl+S**), the selection in the **Merge Action** column in the top panel automatically changes to **Use merged** and a copy of the original file is kept so that you can revert to the original file if necessary. To discard your manual changes and revert to your original changes, select a different action in the **Merge Action** drop-down menu.

Open Merged Files

If you select this option, all the files that will be modified by the merge operation will be opened in the editor after the operation is finished.

Applying Changes

When you click the **Apply** button, all the merge actions you have selected and the changes you have made will be processed.

If there are unresolved conflicts (conflicts where no merge action is selected in the **Merge Action** drop-down menu), a dialog box will be displayed that allows you to choose how to solve the conflicts. You can choose between the following:

- **Keep your changes** - If you select this option and then click **Apply**, your local changes will be preserved for the unresolved conflicts.
- **Overwrite your changes** - If you select this option and then click **Apply**, your local changes will be overwritten with the changes made by others, for the unresolved conflicts.
- **Cancel** - You can click the **Cancel** button to go back to the merge tool to resolve the conflicts individually.

Canceling Changes

If you click the **Cancel** button at the bottom of the merge tool, all the changes you made in the tool will be lost.

Author Visual Mode

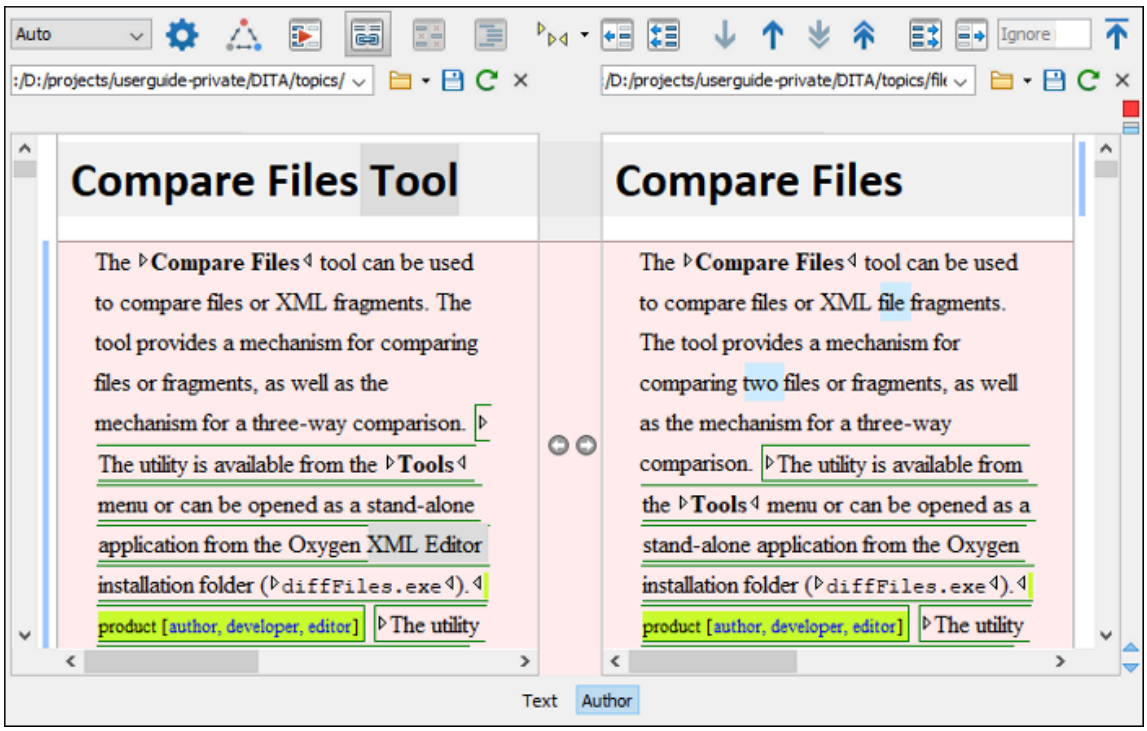
The **Comparison and Merge** tool includes an **Author** mode that displays the files in a visual mode similar to the **Author** editing mode in *Oxygen XML Editor/Author*. This makes it easier to see how the compared changes will look in the final output. This visual mode is available when the compared files are detected as being XML. To determine whether the files are initially opened in the merge tool's **Text** or **Author** mode, it

detects the **Initial Edit Mode** in the *Document Type Association* configuration *(on page 149)* and the mode the files were last opened in *Oxygen XML Editor/Author*.

Note:
This mode is not available if the **Enable file comparison in Author mode** option *(on page 295)* is not selected in the **Diff > Files Comparison** preferences page.

This visual mode includes unique features such as a **Tags Display Mode** drop-down button *(on page 514)* on the toolbar that allows you to select the amount of tags to display in this visual mode. This mode also presents differences that were made using the **Track Changes** feature (although the **Track Changes** feature is not available in the comparison tool).

Figure 104. File Comparison Tool - Author Mode



Author Mode Algorithms

The visual **Author** mode offers the following diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Author Mode Second-Level Comparisons

The visual **Author** mode automatically performs a second-level comparison for the **XML Fast** and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparison is processed on text nodes using a word level comparison, meaning that it looks for identical words. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

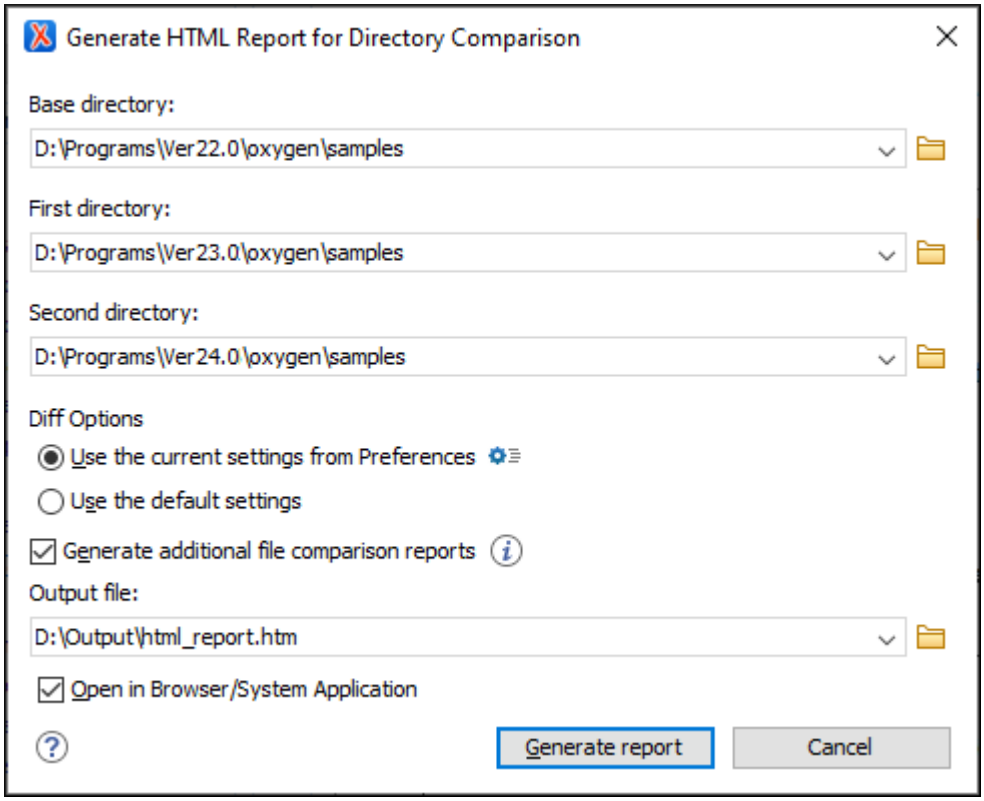
Compare Directories Tool *(on page 504)*
Compare Files Tool *(on page 484)*

Generate HTML Report for Directory Comparison

The **Generate HTML report for directory comparison** tool can be used to generate a report in the form of an HTML file that contains the results of a directory comparison (for either 2-way or 3-way comparisons). The **Generate HTML report for directory comparison** action for invoking the tool can be found in the **Tools > Comparison Tools** menu. It opens a dialog box where you can specify the directories to compare as well as some other options.

Figure 105. Generate HTML Report for Directory Comparison Dialog Box



The **Generate HTML report for directory comparison** dialog box contains the following options:

Base directory

Specifies the path of the base directory that the other two directories will be compared against in a 3-way comparison. This field should be left empty for 2-way comparisons.

First directory

Specifies the path of the first directory to be included in the comparison.

Second directory

Specifies the path of the second directory to be included in the comparison.

Diff options

Specifies which option set to use for generating the comparison report. If you choose **Use the current settings from Preferences**, the options set in the **Directories Comparison** preferences page *(on page 298)* and the include/exclude filter options in the **Compare Directories** tool *(on page 507)* are taken into account when generating the comparison result. You can also click the **Diff options** button to open the **Directories Comparison** preferences page where you can see or modify the current settings. If you choose **Use the default settings**, the default values for all settings are used.

Generate additional file comparison reports

Generates further comparison reports for all non-binary modified file pairs and provides links to them in the main report (in the middle cells of the results table). See the example below *(on page 521)*. These additional file comparison reports are saved to a directory that will have the same parent directory and the same name as the output file provided, suffixed by "**-OXY-FC-REPORTS**". The links created in the main report are relative to this directory. If the main HTML report is later copied or moved to another location, to retain full functionality in the browser, the directory with the additional file comparison reports must also be copied/moved to the same location.

Note:
Generating additional file comparison reports could significantly increase the execution time. A progress tracker for the whole operation is available.

Tip:
An XPath expression specified in the **Ignore nodes by XPath** text field within the **Files Comparison** preferences page *(on page 295)* is now taken into account if you enable the **Generate additional file comparison reports** option.

Output file

Specifies the path for an output file to save the comparison results file.

Open in Browser/System Application

Opens the comparison results file in the browser or system application that is associated with HTML files.

After clicking the **Generate report** button, a report in the form of an HTML file is generated with details about the comparison results.

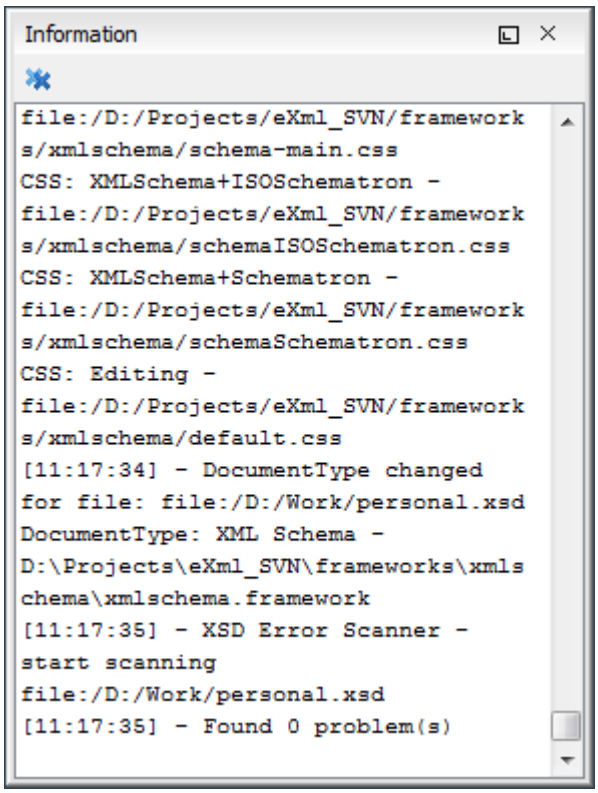
Viewing Status Information

Status information generated by operations such as *schema detection*, *manual validation*, *automatic validation*, and *transformations* are fed into the **Information** view, allowing you to monitor how the operation is being executed.

Figure 108. Information view messages



Messages contain a timestamp, the name of the thread that generated it, and the actual status information. The number of displayed messages can be controlled with the **Maximum number of lines** option *(on page 315)* in the **Views** preference page.

To make the view visible, select **Window > Show View > Information**.

Editor Highlights

An *editor highlight* is a text fragment emphasized by a colored background.

Highlights are generated in both **Text** and **Author** mode when the following actions generate results:

- **Find/Replace in Files** *(on page 446)*
- **Find/Replace** *(on page 442)*
- **Open/Find Resource** *(on page 436)*
- **Find All**
- **Find All Elements** *(on page 452)*
- **XPath in Files** *(on page 420)*
- **Search References** *(on page 587)*
- **Search Declarations** *(on page 587)*

By default, Oxygen XML Editor uses a different color for each type of highlight (*XPath in Files*, *Find/Replace*, *Search References*, *Search Declarations*, etc.) You can customize these colors and the maximum number of highlights displayed in a document on the **Editor** preferences page *(on page 176)*. The default maximum number of highlights is 10000.

You can navigate the highlights in the current document by using the following methods:

- Clicking the markers from the range ruler, located at the right side of the editor pane.
- Clicking the **Next** and **Previous** buttons ( ) from the bottom of the range ruler, located at the right side of the editor pane.

  Note:
  When there are multiple types of highlights in the document, the **Next** and **Previous** buttons ( ) navigate through highlights of the same type.

- Clicking the messages displayed in the **Results** view *(on page 558)* view at the bottom of the editor.

To remove the highlights, you can do the following:

- Click the **Remove all** button from bottom of the range ruler, located at the right side of the editor pane.
- Close the results tab at the bottom of the editor that contains the output of the action that generated the highlights.
- Click the **Remove all** button on the right side of the **Results** view *(on page 558)* view at the bottom of the editor.

  Note:
  Use the **Highlight all results in editor** button (on the right side of the **Results** panel) to either display all the highlights or hide them.

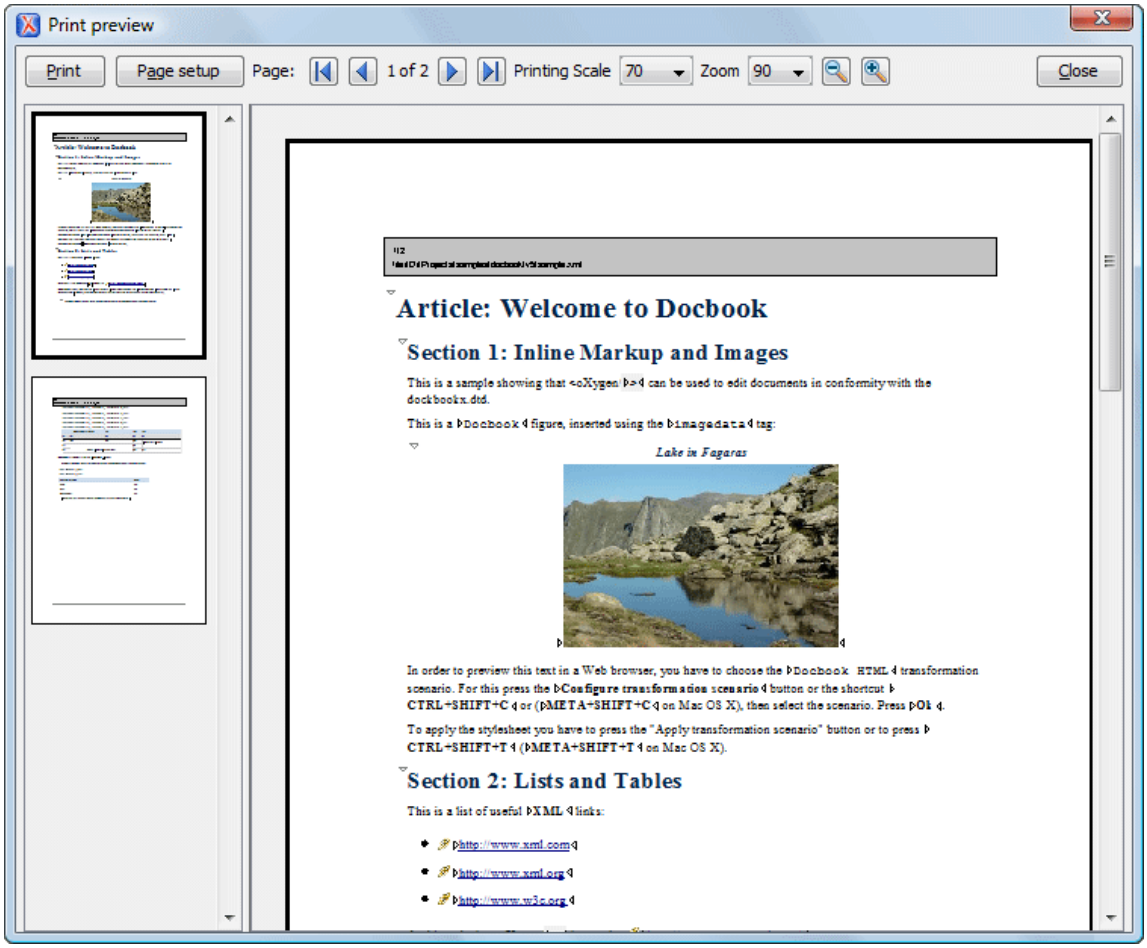
Printing a Document

Printing is supported in **Text**, **Author,** and **Grid** modes.

The **Print** (**Ctrl + P (Command + P on macOS)**) action that is available from **File** menu displays a series of dialog boxes that allow you to configure print settings. After defining the settings in each dialog box, click **OK** to continue to the next one.

A **Print Preview** action is also available in the **File** menu. It first opens a **Page Setup** dialog box where you can define some paper, orientation, and margin settings. After you click **OK**, it displays the **Print Preview** dialog box where you can see a preview of how the document will look when it is printed..

Figure 109. Print Preview Dialog Box



The main window is split in three sections:

- **Preview area** - Displays the formatted document page as it will appear on printed paper.
- **Left stripe** - The left-side stripe that displays a list of thumbnail pages. Clicking any of them displays the page content in the main preview area.
- **Toolbar** - The toolbar area at the top that contains controls for printing, page settings, page navigation, print scaling, and zoom.

Other Printing Features

- If you are printing a document that is opened in the **Author** visual editing mode, you can use the CSS print media type *(on page 2429)* to change the styling in the printed output.
- If you are printing a document that is opened in **Author** mode and it contains *Tracked Changes (on page 652)*, you can print (or print preview) a copy of the document as if all changes have been accepted by switching the **Track Changes Visualization Mode** *(on page 657)* to **View Final**.
- If you are printing a document that is opened in **Text** mode and line numbers are displayed (the **Show line numbers** option *(on page 179)* is selected), the printed output will include the line numbers.
- If you are printing an XML document that is opened in **Text** mode and the *folding* support is activated (the **Enable folding** option *(on page 180)* is selected), the printed output will include the current *folded* state. Note that this applies to printing an entire document and not selections within the document.
- If you are printing an XML document that is opened in **Text** mode and a block of content is selected, you have the ability to print only the selection of text rather than the entire document. When you invoke the print action with a block of content selected in **Text** mode, a dialog box will be presented that offers you the choice to print the selection or the entire document.

8.

Editing Supported Document Types

Oxygen XML Editor includes built-in *frameworks* for the most popular XML document types (DITA, DocBook, TEI, XHTML, JATS) *(on page 1327)* with a full set of features (full editing support, document templates, enhanced CSS rendering, specific actions, validation, content completion, transformation scenarios, and more). In addition, Oxygen XML Editor provides support for editing numerous other types of documents (all XML document types and even some non-XML formats).

Each type of document has unique features and options and this chapter includes a large amount of information about editing numerous types of documents and various editing features that are provided in Oxygen XML Editor, including general information about editing XML documents in **Text** mode *(on page 527)*, the visual **Author** mode *(on page 598)*, and **Grid** mode *(on page 589)*.

For extensive details about the DITA editing features included in Oxygen XML Editor, see the DITA Authoring chapter *(on page 3062)*.

Related information

Built-in Frameworks (Document Types) *(on page 1327)*

Editing XML Documents

The structure of an XML document and the required restrictions on its elements and their attributes are defined with an XML schema. This makes it easier to edit XML documents in the visual **Author** editing mode. For more information about schema association, see Associating a Schema to XML Documents *(on page 827)*.

Oxygen XML Editor includes fully supported built-in *frameworks (on page 3420)* for the most popular XML document types (DITA, DocBook, TEI, XHTML, JATS) *(on page 1327)* with a full set of features. These built-in *frameworks* are defined according to a set of rules and a variety of settings that improve editing capabilities for its particular file type. For extensive details about the DITA editing features included in Oxygen XML Editor, see the DITA Authoring chapter *(on page 3062)*.

This section includes information about the user interface components and actions that are available in the various editing modes and numerous features to help you edit XML documents in any mode.

Built-in Frameworks (Document Types) *(on page 1327)*

Editing XML Documents in Text Mode

This section includes topics that describe how to work with XML documents in **Text** mode, including various features, actions that are available, and much more.

The Oxygen XML Editor **Text** editing mode is designed to be a simple, yet powerful, XML source editor. You can use this mode to edit XML code, markup, and text and it provides support to help you transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Editor also includes numerous specialized editing actions, a powerful *Content Completion Assistant (on page 542)*, a helpful **Outline** view *(on page 549)*, and many other unique features.

To switch to this mode, select **Text** at the bottom of the editing area. 

Navigating the Document Content in Text Mode

Oxygen XML Editor includes some useful features to help you navigate XML documents in **Text** mode.

Navigation Keyboard Shortcuts

Ctrl + CloseBracket (Command + CloseBracket on macOS)

Navigate to the next XML node.

Ctrl + OpenBracket (Command + OpenBracket on macOS)

Navigate to the previous XML node.

Ctrl + RightArrow (Command + RightArrow on macOS)

Navigate one word forward.

Ctrl + LeftArrow (Command + LeftArrow on macOS)

Navigate one word backward.

Ctrl + Home (Command + Home on macOS)

Position the cursor at the beginning of the document.

Ctrl + End (Command + End on macOS)

Position the cursor at the end of the document.

Navigating to a Modification

Oxygen XML Editor includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar (they can also be accessed from the **Find** menu):

 **Last Modification**

Navigates to the last modification in any open tab.

 **Back**

Navigates to the last selected editor tab or to the last selected element/content in the current tab. You can also go back after clicking on links in **Text** or **Author** mode.

Forward

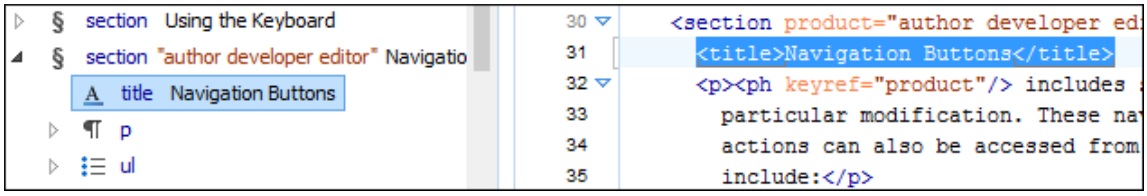
Available after you use the **Back** button at least once, and it navigates in the opposite direction as the **Back** button.

Navigating with the Outline View

Oxygen XML Editor includes an **Outline** view *(on page 549)* that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

Figure 110. Outline View Navigation in Text Mode



Using the Breadcrumb to Navigate

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

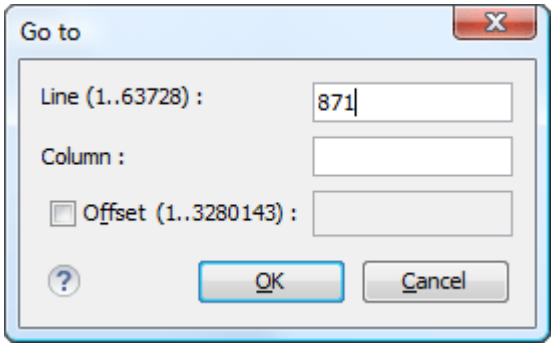
Figure 111. Breadcrumb in Text Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

Navigating with the Go To Dialog Box

In **Text** mode, you can navigate precisely to a location in the document you are editing by using the **Go to** dialog box. To open this dialog box, press **(Ctrl+L (Command+L on macOS))** or select **Find > Go to** .

Figure 112. Go to Dialog Box



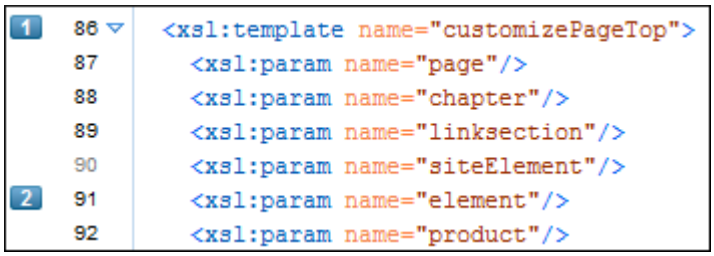
The dialog box includes the following fields for specifying a specific navigation location:

- **Line** - Destination line in the current document.
- **Column** - Destination column in the current document.
- **Offset** - Destination offset relative to the beginning of document.

Navigating with Bookmarks

By using *bookmarks*, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents. You can place up to nine distinct *bookmarks* in any document. Shortcut keys are available to navigate to any of the marked positions (**Ctrl+1** through **Ctrl+9**). There are also shortcuts for creating bookmarks (**Ctrl+Shift+1** through **Ctrl+Shift+9**). You can also configure these shortcut keys in the **Options > Menu Shortcut Keys** *(on page 303)* menu.

Figure 113. Editor Bookmarks



To insert a *bookmark* in **Text** mode, do any of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Press **F9** on your keyboard or use any of the specific bookmark creation shortcuts **(Ctrl+Shift+1** through **Ctrl+Shift+9)**.
- Select the **Create Bookmark** action from the **Edit > Bookmarks** menu.

To remove *bookmark* in **Text** mode, do either of the following:

- Left-click its icon in the vertical stripe.
- Right-click its icon on the vertical stripe and select **Remove** or **Remove all (Ctrl+F7 (Command+F7 on macOS))**.

To navigate to a specific *bookmark*, do either of the following:

- Use any of the specific bookmark navigation shortcuts **(Ctrl+1** through **Ctrl+9)**.
- Use one of the actions available on the **Edit > Bookmarks > Go to** menu.

> **Tip:**
> The navigation shortcuts work even if the document where the bookmark was inserted has been closed. In this case, using the shortcut will automatically re-open the document.

Smart Editing in Text Mode

Oxygen XML Editor includes *smart editing* features to help you edit XML documents in **Text** mode. The following smart editing features are included:

- **Closing tag auto-expansion** - This feature helps save some keystrokes by automatically inserting a closing tag when you insert a complete start tag and the cursor is automatically placed in between the start and end tags. For instance, after entering a start `<tag>`, the corresponding closing `</tag>` is automatically inserted and the cursor is placed between the two (`<tag>`|`</tag>`.
- **Auto-rename matching tag** - When you edit the name of a start tag, Oxygen XML Editor will mirror-edit the name of the matching end tag. This feature can be controlled from the **Content Completion** option page *(on page 219)*.
- **Auto-breaking the edited line** - The **Hard line wrap** option *(on page 212)* automatically breaks the edited line when its length exceeds the maximum line length defined for the format and indent operation *(on page 212)*.
- **Indent on Enter** - The **Indent on Enter** option *(on page 211)* indents the new line inserted when you press **Enter**.
- **Smart Enter** - The **Smart Enter** option *(on page 212)* inserts an empty line between the start and end tags. If you press **Enter** between a start and end tag, the action places the cursor in an indented position on the empty line between the lines that contain the start and end tag.
- **Double-click** - A double-click selects certain text, depending on the position of the click in the document:
  - If the click position is on a start tag or end tag, then the element name is selected.
  - If the click position is immediately after the opening quote or immediately before the closing quote of an attribute value, then the entire attribute value is selected.
  - Otherwise, a double-click selects contiguous text.
- **Triple-click** - A triple-click selects entire regions of text, depending on the click position:
  - If the click position is on a start or end tag, then the entire tag is selected, including the start and end tags, and the content in between.
  - If the click position is after a start tag or before an end tag, then the entire content of the element without the start and end tags is selected.
  - If the click position is before a start tag or after an end tag, then the entire tag is selected, including the start and end tags, and the content in between.

- If the click position is immediately before an attribute, then the entire attribute and its value are selected.
- If the click position is in between the opening and closing quotes of an attribute value, then the entire attribute value is selected.
- Otherwise, it selects the entire current line.

Shortcut Actions in Text Mode

Oxygen XML Editor includes numerous shortcut actions to help you edit content in the **Text** editing mode.

Changing the Font Size (Zoom)

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on macOS) or Ctrl + MouseWheelForward (Windows/Linux)

Increases the font size (zooms in) with one point for each execution of the action.

> **Note:**
> For macOS, if you activate the **Enable mouse-wheel zooming** option *(on page 178)* in the **Editor** preferences page, you can use **Command + MouseWheelForward** to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on macOS.

Decrease editor font (Ctrl + NumPad- (Command + NumPad- on macOS) or Ctrl + MouseWheelBackwards (Windows/Linux)

Decreases the font size (zooms out) with one point for each execution of the action.

> **Note:**
> For macOS, if you activate the **Enable mouse-wheel zooming** option *(on page 178)* in the **Editor** preferences page, you can use **Command + MouseWheelBackwards** to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on macOS.

Normal editor font (Ctrl + 0 (Command + 0 on macOS))

Resets the font size to the value of the editor font set in the **Fonts** preferences page *(on page 140)*.

Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

Undo (Ctrl + Z (Command + Z on macOS))

Reverses a maximum of 200 editing actions (configurable with the **Undo history size** option *(on page 177)* in the **Editor** preferences page) to return to the preceding state.

> **Note:**
> Complex operations such as **Replace All** or **Indent selection** count as single undo events.

Redo (Ctrl + Y (Command + Shift + Z on macOS, Ctrl + Shift + Z on Linux/Unix))

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Select All (Ctrl + A (Command + A on macOS))

Selects the entire content of the current document.

Moving XML Nodes

You can use the following shortcuts to move XML elements or XSLT variables up or down in **Text** mode:

Ctrl + Alt + UpArrow (Command + Option + UpArrow on macOS)

Moves the node up one line.

Ctrl + Alt + DownArrow (Command + Option + DownArrow on macOS)

Moves the node down one line.

> **Note:**
> The requirements for these node moving actions to work are as follows:

- The mechanism is designed to work without a selection. If you use these actions on a selection of content, it moves the entire selection. To make this mechanism work as intended, simply position the cursor somewhere on the line that you want to move.
- A start tag must be the first text occurrence on the line where the cursor is positioned.
- On the line where the element ends, only whitespaces are allowed after the end tag.

Miscellaneous Shortcut Actions in Text Mode

Oxygen XML Editor also includes the following other miscellaneous shortcut actions in **Text** mode:

Ctrl + Delete (Command + Delete on macOS)

Deletes the next word.

Ctrl + Backspace (Command + Backspace on macOS)

Deletes the previous word.

Ctrl + W (Command + W on macOS)

Cuts the previous word.

Ctrl + K (Command + K on macOS)

Cuts to end of line.

Ctrl + Single-Click (Command + Single-Click on macOS)

Use this shortcut to open any of the following:

- Any absolute URL (URLs that have a protocol), regardless of their location in the document.
- URI attributes such as: `@schemaLocation`, `@noNamespaceSchemaLocation`, `@href` and others.
- Open the target for DITA references (such as a `@conref`, `@conkeyref`, `@keyref`, and more).
- Processing instructions used for associating resources, xml-models, xml-stylesheets.

Ctrl + Shift + Y (Command + Shift + Y on macOS) (Document > Edit > Toggle Line Wrap)

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

Frequently Used Shortcut Keys *(on page 55)*

Editing XML Markup in Text Mode

Oxygen XML Editor includes some useful actions that allow you to easily edit XML markup in **Text** mode. These actions are available in the **Refactoring** submenu of the contextual menu and in the **Document > Markup** menu, and many of the actions can also be done with simple keyboard shortcuts.

Using the Breadcrumb

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

Figure 114. Breadcrumb in Text Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element in the *breadcrumb* selects the entire element in the editor area. Also, each element provides a contextual menu with access to the following actions:

Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

Edit Attributes

Opens an editing window that allows you to edit the attributes of the currently selected element.

Toggle Comment

Encloses the currently selected element in a comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Cut

Removes the selected element and copies it to the clipboard.

Copy

Copies the selected element to the clipboard.

Delete

Deletes the currently selected element.

Move Nodes

You can easily move XML nodes in the current document by using the following shortcut keys:

Alt + UpArrow (Option + UpArrow on macOS)

Moves the current node or selected nodes in front of the previous node.

Alt + DownArrow (Option + DownArrow on macOS)

Moves the current node or selected nodes after the subsequent node.

Rename Elements

You can rename elements by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Rename Prefix (Alt + Shift + P (Command + Shift + P on macOS))

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Editor will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from `p1` to `p5`. If `p5` is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from `p1` to `p5` without inserting a new declaration.
- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

Surround Content with Tags (Wrap)

You can surround a selection of content with tags (*wrap* the content) by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Surround with submenu

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

Surround with Tags (Ctrl + E (Command + E on macOS))

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option *(on page 220)* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option *(on page 220)* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on macOS))

Surround the selected content with the last tag used.

Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Delete element tags (Alt + Shift + X (Command + Option + X on macOS))

Deletes the start and end tag of the current element.

Join or Split Elements

You can join or split elements in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Join elements (Alt + Shift + J (Command + Option + J on macOS))

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

Split element (Alt + Shift + D (Ctrl + Option + D on macOS))

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Refactoring XML Documents *(on page 852)*
Contextual Menu Actions in Text Mode *(on page 577)*
Frequently Used Shortcut Keys *(on page 55)*

Folding XML Elements in Text Mode

When working with a large document, the *folding (on page 3420)* support in Oxygen XML Editor can be used to collapse some element content leaving only those that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

By default, the *folding (on page 3420)* feature is enabled in Oxygen XML Editor, but it can be disabled in the **Text** preferences page with the **Enable folding** option *(on page 180)*.

Figure 115. Folding of XML Elements in Text Mode

The fact that the folds are persistent is a unique feature of Oxygen XML Editor. The next time you open the document the folds are restored to its last state.

Folding Actions in Text Mode

Element folds are marked with a small triangle (/) in the left stripe. To toggle the fold, simply click the icon. Also, if you right-click the icon, the following actions are available:

Collapse Other Folds

Folds all the elements except the current element.

Collapse Child Folds

Folds the child elements that are indented one level inside the current element.

Expand Child Folds

Unfolds all child elements of the currently selected element.

Expand All

Unfolds all elements in the current document.

Resources

For more information about the *folding* support in Oxygen XML Editor, watch our video demonstration:

https://www.youtube.com/embed/eR9HfN_peAE

Drag and Drop in Text Mode

To move a whole region of text to other location in the same edited document, just select the text, drag the selection by holding down the left mouse button and drop it to the target location.

You can also copy content from other applications and paste it into the document.

Selecting Content in Text Mode

Oxygen XML Editor includes a variety of keyboard shortcuts that allow you to select content in **Text** mode. These include numerous standard continuous selection possibilities that are common to many text editors, as well as a selection feature that allows you to select a rectangular area within a document in **Text** mode.

Standard Continuous Selection Shortcuts

Ctrl + A (Meta + A on macOS)

Selects all content in the document.

Shift + Left/Right Arrow Keys

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

Shift + Up/Down Arrow Keys

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on macOS)

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

Shift + Home

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on macOS, it extends to the beginning of the document).

Shift + End

Begins a continuous selection at the cursor position and extends it to the end of the current line (on macOS, it extends to the end of the document).

Ctrl + Shift + Home

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

Ctrl + Shift + End

Begins a continuous selection at the cursor position and extends it to the end of the document.

Shift + PageUp

Begins a continuous selection at the cursor position and extends it up one screen page.

Shift + PageDown

Begins a continuous selection at the cursor position and extends it down one screen page.

Double-Click

Selects certain text, depending on the position of the click in the document. See Smart Editing: Double-Click *(on page 530)* for the specifics.

Triple-Click

Selects entire regions of text, depending on the position of the click in the document. See the Smart Editing: Triple-Click *(on page 530)* for the specifics.

Right-Click > Select > Element

Selects the entire element at the current cursor position.

Right-Click > Select > Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Right-Click > Select > Attributes

Selects all the attributes of the element at the current cursor position.

Right-Click > Select > Parent

Selects the entire parent element at the current cursor position.

Rectangular Selection Shortcuts

Oxygen XML Editor also includes some keyboard shortcuts that allow you to select a rectangular block of content in **Text** mode and you can then copy, cut, paste, delete, or edit the selection.

Attention:
The rectangular selection shortcuts will not work if the **Line Wrap** option *(on page 180)* is selected in the **Text** preferences page.

The following shortcuts can be used to create a rectangular selection:

Alt + Mouse Click + Mouse Movement (Option + Meta + Mouse Click + Mouse Movement on macOS)

Begins a rectangular selection at the mouse click position and extends it in the direction that you move the mouse. Release **Alt** **(Alt + Meta on macOS)** to enter the *in-place editing* mode *(on page 541)*.

Shift + Alt + Left/Right Arrow Keys (Shift + Option + Meta + Left/Right Arrow Keys on macOS)

Begins a rectangular selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

Shift + Alt + Up/Down Arrow Keys (Shift + Option + Meta + Up/Down Arrow Keys on macOS)

Begins a rectangular selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

Ctrl + Shift + Alt + Left/Right Arrow Keys (Ctrl + Shift + Option + Meta + Left/Right Arrow Keys on macOS)

Begins a rectangular selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

Shift + Alt + Home (Shift + Option + Meta + Home on macOS)

Begins a rectangular selection at the cursor position and extends it to the beginning of the current line.

Shift + Alt + End (Shift + Option + Meta + End on macOS)

Begins a rectangular selection at the cursor position and extends it to the end of the current line.

Shift + Alt + PageUp (Shift + Option + Meta + PageUp on macOS)

Begins a rectangular selection at the cursor position and extends it up one screen page.

Shift + Alt + PageDown (Shift + Option + Meta + PageDown on macOS)

Begins a rectangular selection at the cursor position and extends it down one screen page.

You can then use standard editing actions to copy, cut, paste, or delete the entire selection.

In-Place Editing Mode

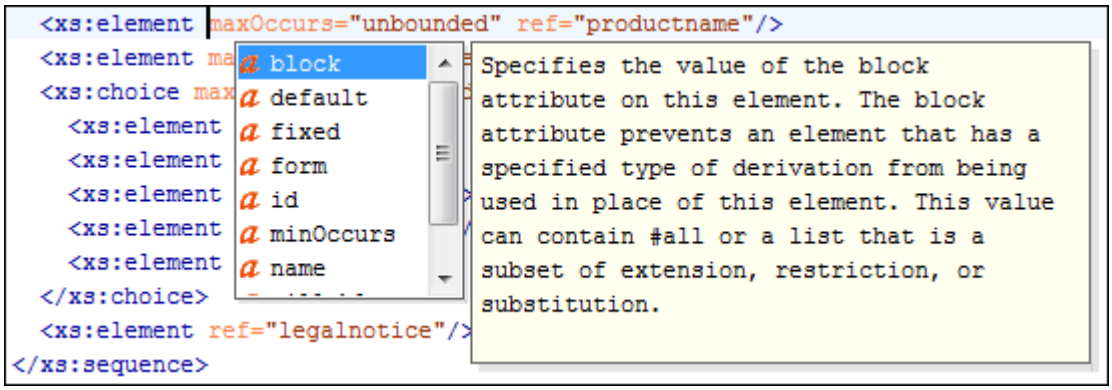
To edit the content of the rectangular selection, you can enter an in-place editing mode by releasing the **Alt** key (on macOS, release both **Alt** & **Meta**). Once you are in the editing mode, you can simply use your keyboard to edit the entire selection of content, or click anywhere inside the selection to edit the content at the cursor position for all lines within the selection at once (as if the rectangular selection is a selection of columns). To exit the editing mode, press either **Enter** or **Esc**.

Content Completion Assistant in Text Mode

Oxygen XML Editor includes an intelligent *Content Completion Assistant (on page 3418)* that offers proposals for inserting structured language elements, attributes, and attribute values that are valid in the current editing context.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Editor > Content Completion**, and deselect the **Enable content completion** option *(on page 219)*.

Figure 116. Content Completion Assistant



Content Completion and the Associated Schema

The *Content Completion Assistant* feature is schema-driven and the list of proposals in the *Content Completion Assistant (on page 3418)* depend on the associated schemas (DTD, XML Schema, Relax NG, or NVDL schema). For information about the various ways to associate a schema and the order of their precedence, see the Associating a Schema to XML Documents *(on page 827)* section.

Using the Content Completion Assistant in Text Mode

The feature is activated in **Text** mode in the following situations:

- After you enter the **<** character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the **Activation delay of the proposals window (ms)** option *(on page 221)* from the **Content Completion** preferences page.
- After typing a partial element or attribute name, you can manually activate it by pressing **Ctrl + Space** or **Alt + ForwardSlash (Command + Option + ForwardSlash on macOS)**. If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. In some cases, the *Content Completion Assistant* displays a documentation window with information about the particular proposal and some of them have links to additional information (for example, DITA elements might have a link to the DITA Style Guide). You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on macOS)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

Note:
When the DTD, XML Schema or RELAX NG schema specifies required child elements for the newly added element, they are inserted automatically only if the **Add Element Content** option *(on page 219)* (in the **Content Completion** preferences page) is selected. The *Content Completion Assistant* can also add optional content and first choice particle, as specified in the DTD, XML Schema, or RELAX NG schema. To activate these features, select the **Add optional content** *(on page 219)* and **Add first Choice particle** *(on page 219)* options in the **Content Completion** preferences page.

After inserting an element, the cursor is positioned:

- Before the > character of the start tag, if the element allows attributes, to allow rapid insertion of any of the attributes supported by the element. Pressing the space bar displays the Content Completion list once again. This time it contains the list of allowed attribute names. If the attribute supports a fixed set of parameters, the assistant list displays the list of valid parameters. If the parameter setting is user-defined and therefore variable, the assistant is closed to allow manual insertion. The values of the attributes can be learned from the same elements in the current document.
- After the > character of the start tag, if the element has no attributes.

Where the Content Completion Assistant is Displayed

The *Content Completion Assistant* is displayed:

- Anywhere within a tag name or at the beginning of a tag name in an XML document, XML Schema, DTD, or Relax NG (full or compact syntax) schema.
- Anywhere within an attribute name or at the beginning of an attribute name in any XML document with an associated schema.
- Within attribute values or at the beginning of attribute values in XML documents where lists of possible values have been defined for that element in the schema associated with the document.

Types of Proposals Listed in the Content Completion Assistant

The following things are considered for determining the proposals that are listed in the content completion window:

Element Structure Specified in DTD or Schema

The proposals that populate the *Content Completion Assistant* depend on the element structure specified in the DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema associated with the edited document.

Note:
The *Content Completion Assistant* is able to offer elements defined both by XML Schemas version 1.0 and 1.1.

Current Cursor Position

The number and type of elements displayed by the *Content Completion Assistant* is dependent on the cursor's current position in the structured document. The child elements displayed within a given element are defined by the structure of the specified DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema.

Unique ID Attribute Values

A schema may declare certain attributes as *ID* or *IDREF/IDREFS*. When the document is validated, Oxygen XML Editor checks the uniqueness and correctness of the `@id` attributes. It also collects the attribute values declared in the document to prepare the list of proposals. This is available for documents that use DTD, XML Schema, and Relax NG schema.

Values for *xml:id* Attributes

Values of all the `@xml:id` attributes are handled as `@id` attributes. They are collected and displayed by the *Content Completion Assistant* as possible values for *anyURI* attributes defined in the schema of the edited document. This works only for XML Schema and Relax NG schemas.

Links/References in DITA

When entering values for the various types of links and references in DITA (for example, values for `@href` or `@conref` elements), the *Content Completion Assistant* will propose potential targets when you use the forward slash key (*/*).

ID Values for DITA Key References

In DITA, when inserting key references (`@keyref`) or content key references (`@conkeyref`), the ID values that are defined in the key reference are presented as possible targets. The *Content Completion Assistant* will only propose targets that are valid in the current context.

Element and Attribute Values

For documents that use an XML Schema or Relax NG schema, the *Content Completion Assistant* offers proposals for attribute and element values as long as the allowed values are defined in the schema. Also, if a default value or fixed value is defined in the schema, then that value is offered in the *Content Completion Assistant*.

Related information

Customizing the Content Completion Assistant Using a Configuration File *(on page 2309)*

Schema Annotations in Text Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in:

- The *Content Completion Assistant (on page 3418)*.
- A small tooltip window shown when the mouse hovers over an element or attribute. The tooltip window can be invoked at any time by using the **F2** shortcut.

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the **Show annotations in Content Completion Assistant** *(on page 224)* option in the **Annotations** preferences page.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `<div>`, `<body>`, `<p>`, `<br>`, `<table>`, `<ul>`, or `<ol>`).

The HTML rendering is controlled by the **Show annotations using HTML format, if possible** *(on page 225)* option in the **Annotations** preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`<p>`, `<br>`, `<ul>`, `<li>`), they are rendered as an HTML document loaded in a web browser. For example, `<p>` begins a new paragraph, `<br>` breaks the current line, `<ul>` encloses a list of items, and `<li>` encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```
<xs:annotation>
  <xs:documentation>
            Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the `http://relaxng.org/ns/compatibility/annotations/1.0` namespace like this:

```
<define name="person" >
  <element name="person">
```

```
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
            Information about a person. </a:documentation>
      <ref name="name"/>
        <zeroOrMore>
      <ref name="email"/>
        </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (`http://relaxng.org/ns/structure/1.0`) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the **Use all Relax NG annotations as documentation** *(on page 225)* option in the **Annotations** preferences page.

Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```
##  Information about a person.
element person { name, email*}
```

Collecting Annotation from DTDs

For DTD, Oxygen XML Editor defines a custom mechanism for annotations using comments enabled by the **Prefer DTD comments that start with "doc:" as annotations** *(on page 224)* option in the **Annotations** preferences page. The following is an example of a DTD annotation:

```
<!--doc:Description of the element. -->
```

Content Completion Helper Views (Text Mode)

Information about the current element being edited is also available in various *dockable (on page 3418)* views, such as the **Model** view *(on page 555)*, **Attributes** view *(on page 552)*, **Elements** view *(on page 556)*, and **Entities** view *(on page 557)*. By default, they are located on the right-hand side of the main editor window. These views, along with the powerful **Outline** view *(on page 549)*, provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Editor includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, JSON, HTML, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a symbol in the content completion list (**Enter** in **Author** mode or **Ctrl + Space** in **Text** mode). Also, in **Text** mode you can press **Ctrl + Shift + Space** to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content

completion list or type its code and press **Enter**. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

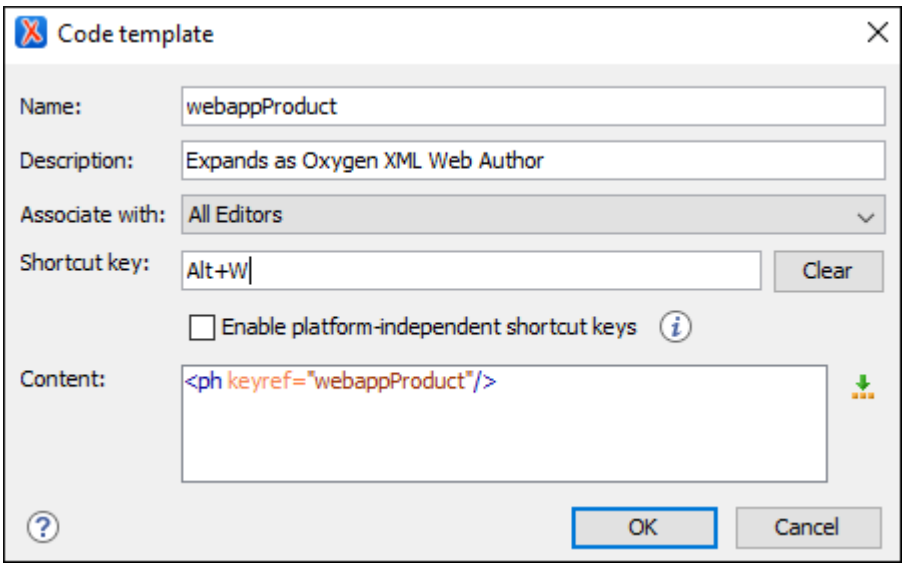
How to Create Code Templates

To create a code template, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Content Completion > Code Templates**.
2. Click **New** to open a code template configuration dialog box.

   Tip:
   You can use one of the existing code templates as a starting point by selecting that template and clicking **Duplicate**.

   Figure 117. Code Template Configuration Dialog Box

3. Configure your template using the fields in the code template configuration dialog box:
   - **Name** - The name of the code template.
   - **Description** - [Optional] The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the *Content Completion Assistant (on page 3418)*. HTML markup can be used for better rendering.
   - **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
   - **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the **Clear** button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:

        - **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
        - **M2** represents the **Shift** key.
        - **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
        - **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.
    - **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable *(on page 332)* can be inserted in the text box using the **Insert Editor Variables** button.
4. Click **OK** to save your new code template.

Result: Your code template can now be selected using the *Content Completion Assistant (on page 3418)* (**Enter** in **Author** mode or **Ctrl + Space** in **Text** mode). The code templates are displayed with a symbol.

How to Share Code Templates

There are two ways to easily share all of your code templates with other members of your team:

Method 1: Export/Import

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Templates > Code Templates**.
2. Click the **Export** button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.
5. Instruct them to open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Editor > Templates > Code Templates**, click the **Import** button, and select the file you sent them.

   Result: The code templates will be now available in their content completion list.

Method 2: Share Project

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Templates > Code Templates**.
2. Select **Project Options** at the bottom of the dialog box. This stores the preferences in the project file (`.xpr`).
3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

   Result: When they open the updated project file in their **Project** view *(on page 413)*, the code templates will be available in their content completion list.

Tip:
It is also possible to configure certain actions that function similar to code templates and add them to the content completion list *(on page 2309)* for a particular framework. You could then share the whole framework *(on page 2406)* with other members of your team.

Text Mode Views

There is a variety of *dockable (on page 3418)* helper views that are displayed by default in **Text** mode. There are also a large selection of additional views available in the **Window > Show View** menu. This section presents some of the most helpful views for editing in **Text** mode.

Outline View for XML Documents

The **Outline** view displays a general tag overview of the currently edited XML document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*` or `?`) and separate multiple patterns with commas.

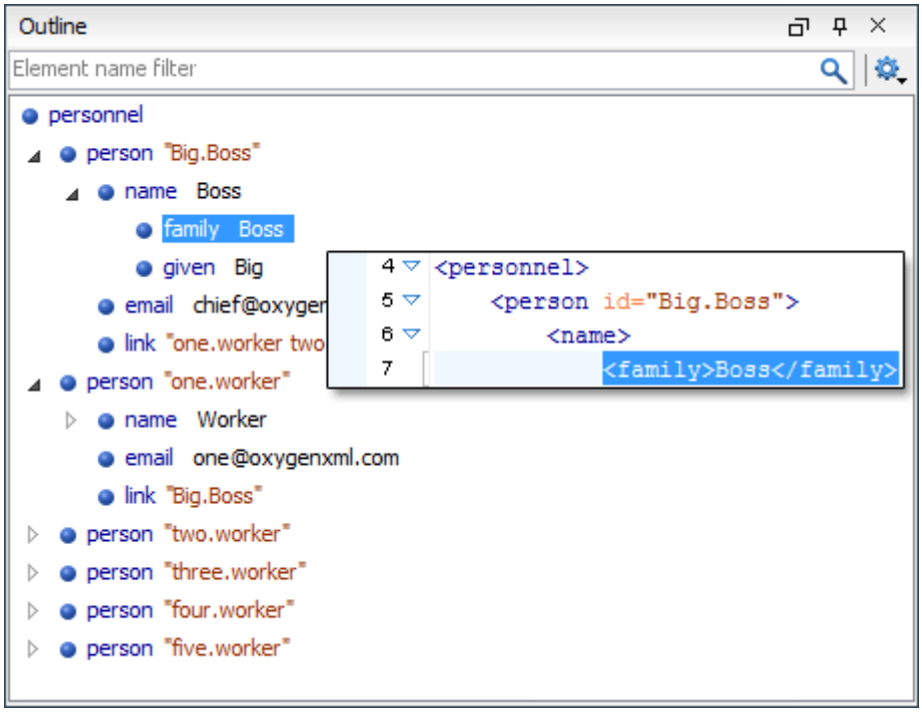
It also includes a **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

Drag and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **Ctrl (Command on macOS)** key after dragging, a copy operation will be performed instead of a move.

Figure 118. Outline View



Outline View Filters

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*` or `?`) and separate multiple patterns with commas.

The following actions are available in the **Settings** menu of the **Outline** view:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move (Available in Text mode)

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel *(on page 315)*.

Configure displayed attributes

Displays the **XML Structured Outline** preferences page *(on page 315)*.

Outline View Contextual Menu Actions

The contextual menu of the **Outline** view contains the following actions:

Edit Attributes

Displays an in-place attributes editor that allows you to edit the attributes of a selected node.

Edit Profiling Attributes (Available in Author mode)

Allows you to change the profiling attributes *(on page 680)* defined on all selected elements.

Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

Cut, Copy, Paste, Delete common editing actions

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content.

Paste before (Available in Author mode)

Inserts a well-formed copied element before the currently selected element.

Paste after (Available in Author mode)

Inserts a well-formed copied element after the currently selected element.

Paste as XML (Available in Author mode)

Pastes copied content that is considered to be valid XML, preserving its XML structure.

Toggle Comment

Encloses the currently selected element in a comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Rename Element (Available in Author mode)

Invokes a **Rename** dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

Expand More

Expands the structure tree of the currently selected element.

Collapse All

Collapses all of the structure tree of the currently selected node.

Tip:
You can copy, cut or delete multiple nodes in the **Outline** by using the contextual menu after selecting multiple nodes in the tree.

Attributes View in Text Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use the **Attributes** view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

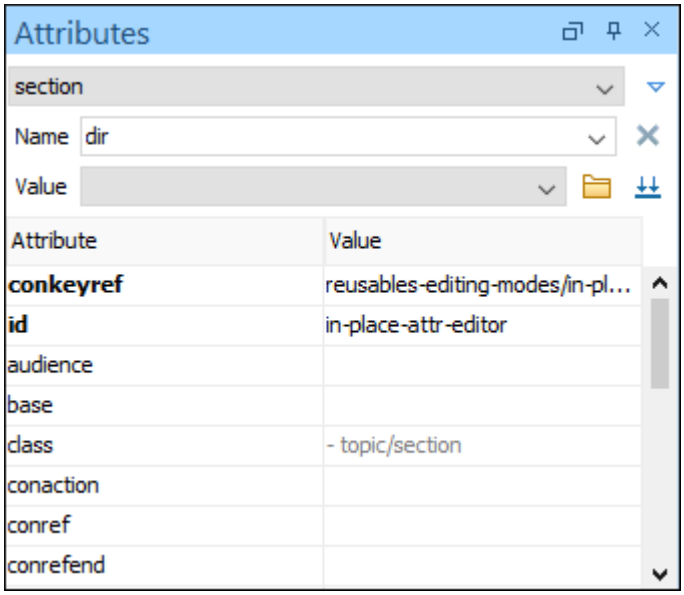
- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Figure 119. Attributes View



Expand/Collapse Button

There is an **Expand/Collapse** (/) button at the top-right of the view. When expanded, this presents the following additional combo boxes:

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the **Remove** button to delete an attribute and its value from the selected element.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values. After you have entered or selected a value, use the **Update** button (or press **Enter**) to add the value to the attribute.

> **Note:**
> For built-in frameworks, if the selected attribute in the **Name** field is an `@id` attribute, the **Browse** button is replaced by a **Generate Unique ID Value** button. Clicking this button will automatically generate a unique ID for the selected element.

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Text** mode:

Add

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the Allow only insertion of valid elements and attributes *(on page 188)* schema-aware option is selected.

Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **Delete** or **Backspace** keys.

Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

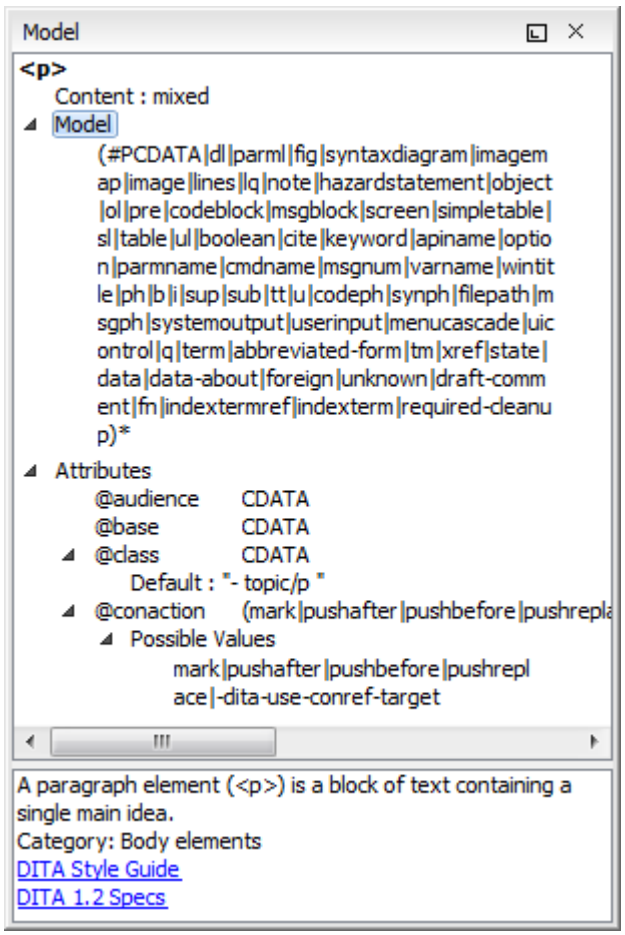
Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

Model View

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 120. Model View

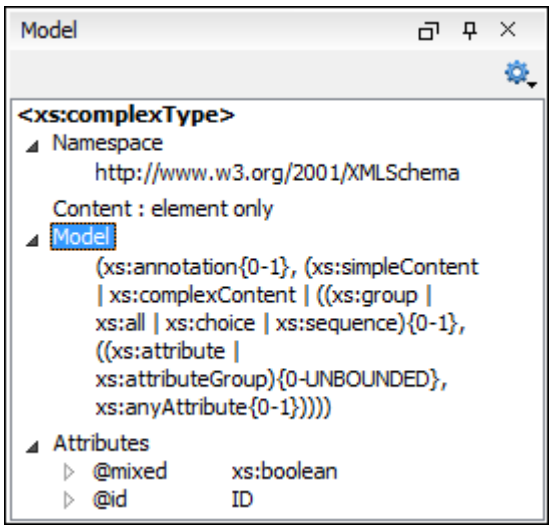


The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

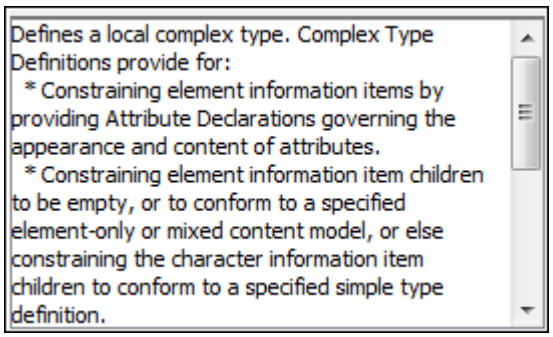
Figure 121. Element Structure Panel



Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 122. Annotation panel

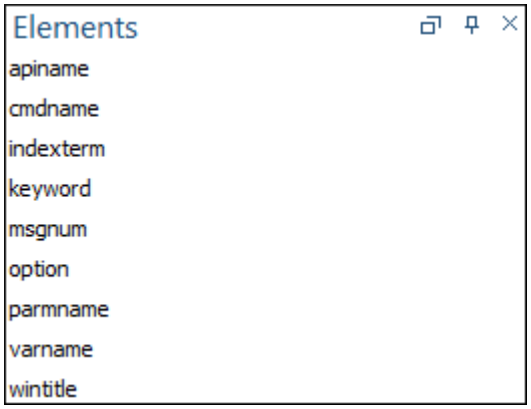


Elements View in Text Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position. Pressing **F2** with an element selected will display information about that particular element.

Figure 123. Elements View in Text Mode



Entities View

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the `ENTITY` statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

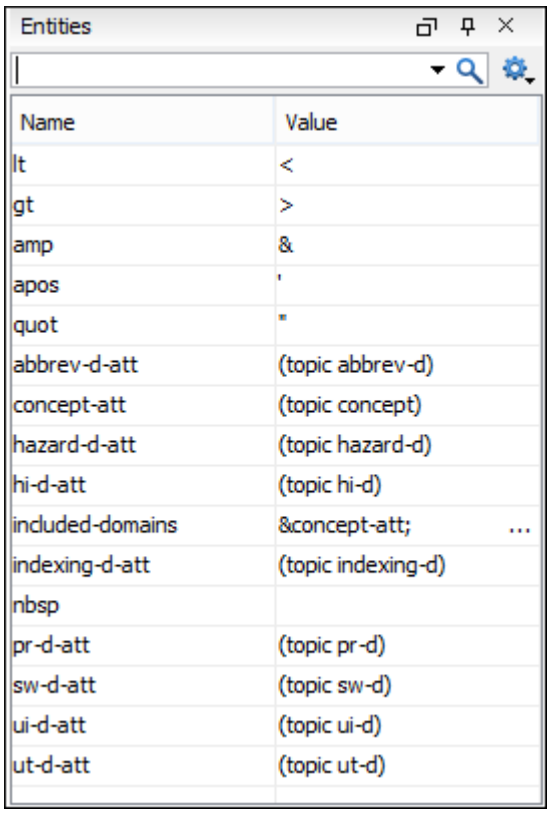
- **Predefined** - Entities that are part of the predefined XML markup (`<`, `>`, `&`, `&apos;`, `&quot;`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

Note:
If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Figure 124. Entities View



The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

Note:
When entering filters, you can use the *?* and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Results View

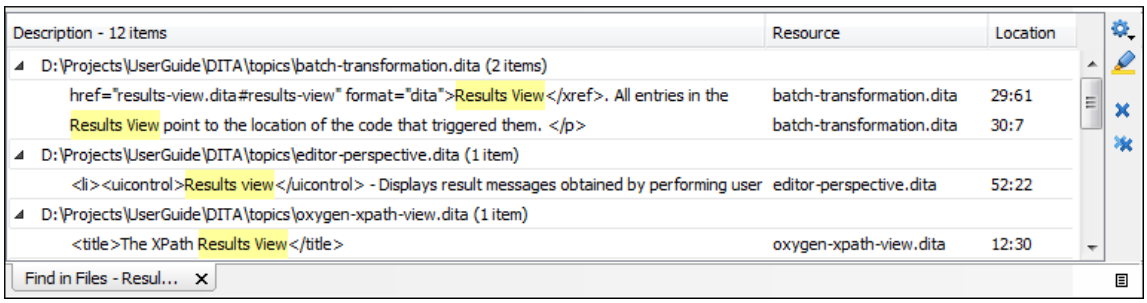
The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages. By default, the view normally opens at the bottom of the editor, but it is *dockable (on page 3418)*, so it can be moved to another UI location alongside other side views.

Tip:
To shift focus to the open **Results** view without using the mouse, there is an action in the **Window > Results** menu called **Focus Results** that can be used for this purpose and you can assign a keyboard shortcut *(on page 303)* to this action.

The actions that contribute messages to this view include:

- **Validation** actions *(on page 786)*
- **Transformation** actions *(on page 1470)*
- **Check Spelling in Files** action *(on page 468)*
- **Find All** action from the **Find/Replace** dialog box *(on page 442)*
- **Find/Replace in Files** dialog box *(on page 446)*
- **Search References** action *(on page 924)*
- XPath expression results *(on page 2118)*
- SQL results *(on page 2184)*

Figure 125. Results View



Results View Toolbar Actions

The view includes a toolbar with the following actions:

Settings drop-down menu

This drop-down menu also includes the following options:

Group by "Severity"

Groups the results based upon the severity of the validation issues.

Group by "Resource"

Groups the results based upon the type of resource.

Group by "System ID"

Groups the results based upon the system ID of the resource.

Group by "Operation description"

Groups the results based upon the description of the validation issue.

Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

Restore default grouping

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the **Check Spelling in Files** action *(on page 468)*.
- No grouping rule for the results of applying an XPath expression *(on page 2117)*.

Include problem ID in description

If this option is selected, validation issues will include the problem ID (as provided by the validation engine) in the **Description** column.

Show Ignored Problems

If you have ignored validation problems *(on page 823)*, you can deselect this option to hide the ignored problems. Likewise, you can select this option to show the ignored problems.

Highlight all results in editor

Oxygen XML Editor highlights all matches obtained after executing an XPath expression, or performing one of the following operations: **Find All**, **Find in Files**, **Search References**, and **Search Declarations**. Click **Highlight all results in editor** again to turn off highlighting.

Note:
To customize highlighting behavior, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Highlights category**. You can do the following customizations:

- Set a specific color of the highlights depending on the type of action you make.
- Set a maximum number of highlights that the application displays at any given time.

Remove selected

Removes the current selection from the view. This can be helpful if you want to reduce the number of messages, or remove those that have already been addressed or not relevant to your task.

Remove all

Removes all messages from the view.

Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

Learn Word(s) (Available when spelling errors are reported in the Results view)

Adds the word(s) to a list of learned words to instruct the spell checker engine to not report the word(s) as spelling errors in the future.

Show message

Displays a dialog box with the full error message, which is useful for a long message that does not have enough room to be displayed completely in the view.

Previous message

Navigates to the message above the current selection.

Next message

Navigates to the message below the current selection.

Remove selected

Removes selected messages from the view.

Remove all

Removes all messages from the view.

Copy

Copies information associated with the selected messages. For example:

- The file path of the document that triggered the output message.
- The path of the *main file (on page 3421)* (in the case of a validation scenario *(on page 798)*, it is the path of the file where the validation starts and can be different from the validated file).
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- Name of validation scenario *(on page 798)*.
- The line and column in the file that triggered the message.

Copy Description

Copies the description values for all selected items. It is possible to assign a shortcut key *(on page 305)* for this action.

Select All

Extends the selection to all the messages from the view.

Print Results

Sends the complete list of messages to a printer. For each message, the included details are the same as the ones for the **Copy** action *(on page 561)*. This action is also available in the **Window > Results** menu.

Save Results

Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the **Copy** action *(on page 561)*. This action is also available in the **Window > Results** menu.

Save Results as XML

Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the **Copy** action *(on page 561)*.

Save Results as HTML

Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the **Copy** action *(on page 561)*.

Group by

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

 **Ungroup all**

Removes the grouping rules so that the messages are presented in a continuous list.

Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

Restore default grouping

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the **Check Spelling in Files** action *(on page 468)*.
- No grouping rule for the results of applying an XPath expression *(on page 2117)*.

 **Expand All**

Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

 **Collapse All**

Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Making a Persistent Copy of Results

The **Results** view *(on page 558)* displays the results from the following operations:

- Document validation *(on page 786)*
- Checking the form of documents *(on page 784)*
- XSLT or FO transformations *(on page 1470)*
- Finding all occurrences of a string in a file *(on page 442)*
- Finding all occurrences of a string in multiple files *(on page 446)*
- Applying an XPath expression to the current document *(on page 2120)*

To make a persistent copy of the **Results** view *(on page 558)*, use one of these actions:

File > Save Results

Displays the **Save Results** dialog box, used to save the result list of the current message tab. The action is also available on the right-click menu of the **Results** panel.

File > Print Results

Displays the **Page Setup** dialog box used to define the page size and orientation properties for printing the result list of the current **Results** panel. The action is also available on the right-click menu of the **Results** panel.

Save Results as XML from the contextual menu

Saves the content of the **Results** panel in an XML file with the format:

```
<Report>
    <Incident>
        <engine>The engine reporting the error.<engine>
        <severity>The severity level<severity>
        <Description>Description of output message.</Description>
        <SystemID>The location of the file linked to the message.</SystemID>
        <Location>
           <start>
                <line>Start line number in file.<line>
                <column>Start column number in file<column>
           </start>
           <end>
                <line>End line number in file.<line>
                <column>End column number in file<column>
           </start>
        </Location>
```

```
    </Incident>
</Report>
```

Syntax Highlighting in XML Documents

Oxygen XML Editor supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XML files, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*.
2. Go to **Editor > Syntax Highlight** *(on page 233)*.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

Tip:

Oxygen XML Editor also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page *(on page 234)*.

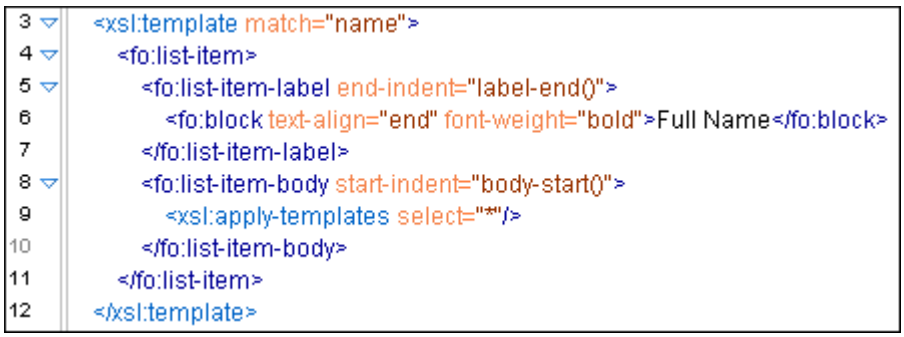
Related Information:

Customize Syntax Highlight colors *(on page 233)*

Syntax Highlight Depending on Namespace Prefix

The syntax highlight scheme of an XML file type *(on page 233)* allows the configuration of a color per each type of token that can appear in an XML file. Distinguishing between the XML tag tokens based on the namespace prefix brings additional visual help in editing some XML file types. For example, in XSLT stylesheets, elements from various namespaces (such as XSLT, XHTML, XSL:FO, or XForms) are inserted in the same document and the editor panel can become cluttered. Marking tags with different colors based on the namespace prefix *(on page 234)* allows easier identification of the tags.

Figure 126. Example of Coloring XML Tags by Prefix



Related Information:

Changing the colors displayed in the Text Mode Editor *(on page 233)*

Formatting and Indenting XML Documents

In **Text** mode *(on page 362)*, you can decide how the XML file is formatted and indented. In the other modes, and when you switch between modes, Oxygen XML Editor automatically formats and indents the XML.

You can trigger a format and indent operation for your XML document (in **Text** mode) using one of the following actions:

- **Format and Indent** toolbar button - Formats and indents the current document.
- **Document > Source > Format and Indent** - Formats and indents the whole document.
- **Document > Source > Indent Selection** - Indents the current selection (but does not add line breaks). This action is also available in the **Source** submenu of the contextual menu.
- **Document > Source > Format and Indent Element** - Formats and indents the current element (the inmost nested element that currently contains the cursor) and its child-elements. This action is also available in the **Source** submenu of the contextual menu.

Various settings affect how Oxygen XML Editor formats and indents XML. Many of these settings have to do with how whitespace is handled.

Significant and Insignificant Whitespace in XML

XML documents are text files that describe complex documents. Some of the white space (spaces, tabs, line feeds, etc.) in the XML document belongs to the document it describes (such as the space between words in a paragraph) and some of it belongs to the XML document (such as a line break between two XML elements). Whitespace belonging to the XML file is called *insignificant whitespace*. The meaning of the XML would be the same if the insignificant whitespace were removed. Whitespace belonging to the document being described is called *significant whitespace*.

Knowing when whitespace is significant or insignificant is not always easy. For instance, a paragraph in an XML document might be laid out like this:

```
<p>NO Free man shall be taken or imprisoned, or be stripped of his Freedom,
or Liberties, or free Customs, or be outlawed, or exiled, or any otherwise
destroyed; nor will we not pass upon him, nor condemn him, but by lawful
judgment of his Peers, or by the <xref
href="http://en.wikipedia.org/wiki/Law_of_the_land" format="html"
scope="external">Law of the land</xref>.
We will sell to no man, we will not deny to any man either Justice or Right.</p>
```

By default, XML considers a single whitespace between words to be significant, and all other whitespace to be insignificant. The paragraph above could have been written on one line because the XML parser would see it as exactly the same paragraph since all multiple consecutive whitespaces will be replaced with a single whitespace. Removing the insignificant space in markup like this is called *normalizing space*.

In some cases, all the spaces inside an element should be treated as significant. For example, in a code sample:

```
<codeblock>
class HelloWorld
{
   public static void main(String args[])
   {
      System.out.println("Hello World");
   }
}
</codeblock>
```

Here every whitespace character between the `<codeblock>` tags should be treated as significant.

How Oxygen XML Editor Determines When Whitespace is Significant

When Oxygen XML Editor formats and indents an XML document, it introduces or removes insignificant whitespace to produce a layout with reasonable line lengths and elements indented to show their place in the hierarchy of the document. To correctly format and indent the XML source, Oxygen XML Editor needs to know when to treat whitespace as significant and when to treat it as insignificant. However it is not always possible to tell this from the XML source file alone. To determine what whitespace is significant, Oxygen XML Editor assigns each element in the document to one of four categories:

Ignore space

In the ignore space category, all whitespace is considered insignificant. This generally applies to content that consists only of elements nested inside other elements, with no text content.

Normalize space

In the normalize space category, a single whitespace character between character strings is considered significant and all other spaces are considered insignificant. Therefore, all

consecutive whitespaces will be replaced with a single space. This generally applies to elements that contain text content only.

Mixed content

In the mixed content category, a single whitespace between text characters is considered significant and all other spaces are considered insignificant.

Notes:

- Whitespace between two child elements embedded in the text is normalized to a single space (rather than to zero spaces as would normally be the case for a text node with only whitespace characters, or the space between elements generally).
- The lack of whitespace between a child element embedded in the text and either adjacent text or another child element is considered significant. That is, no whitespace can be introduced here when formatting and indenting the file.

For example:

```
<p>The file is located in <i>HOME</i>/<i>USER</i>/hello.
     This is a <strong>big</strong>

<emphasis>deal</emphasis>.
</p>
```

In this example, whitespace should not be introduced around the i tags as it would introduce extra significant whitespace into the document. The space between the end `<strong>` tag and the beginning `<emphasis>` tag should be normalized to a single space, not zero spaces.

Preserve space

In the preserve space category, all whitespace in the element is regarded as significant. No changes are made to the spaces in elements in this category. However, child elements may be in another category, and may be treated differently.

Attribute values are always in the preserve space category. The spaces between attributes in an element tag are always in the default space category.

Oxygen XML Editor evaluates several pieces of information to assign an element to one of these categories. An element is always assigned to the most restrictive category (from Ignore to Preserve) that it is assigned to by any of the sources Oxygen XML Editor consults. For instance, if the element is named on the **Default elements** list (as described below) but it has an `@xml:space="preserve"` attribute in the source file, it will be assigned to the preserve space category. If an element has the `@xml:space="default"` attribute in the source, but is listed on the **Mixed content** elements list, it will be assigned to the mixed content category.

To assign elements to these categories, Oxygen XML Editor consults information from the following sources:

xml:space

If the XML element contains the `@xml:space` attribute, the element is promoted to the appropriate category based on the value of the attribute.

CSS whitespace property

If the CSS stylesheet controlling the **Author** mode editor applies the `whitespace: pre` setting to an element, it is promoted to the preserve space category.

CSS display property

If a text node contains only white-spaces:

- If the node has a parent element with the CSS `display` property set to `inline` then the node is promoted to the mixed content category.
- If the left or right sibling is an element with the CSS `display` property set to `inline` then the node is promoted to the mixed content category.
- If one of its ancestors is an element with the CSS `display` property set to `table` then the node is assigned to the ignore space category.

Schema-aware formatting

If a schema is available for the XML document, Oxygen XML Editor can use information from the schema to promote the element to the appropriate category. For example:

- If the schema declares an element to be of type `xs:string`, the element will be promoted to the preserve space category because the string built-in type has the whitespace facet with the value preserve.
- If the schema declares an element to be mixed content, it will be promoted to the mixed content category.

Schema-aware formatting can be turned on and off.

- To turn it on or off for **Author** mode, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Editor > Edit modes > Author > Schema-Aware**, and select/deselect the **Schema-aware normalization, format and indent** option *(on page 188)*.
- To turn it on or off for the **Text** editing mode,open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Editor > Format > XML**, and select/deselect the **Schema-aware format and indent** option *(on page 216)*.

Preserve space elements list

If an element is listed in the **Preserve space** tab of the **Element Spacing** list *(on page 215)* in the XML formatting preferences *(on page 213)*, it is promoted to the preserve space category.

Default space elements list

If an element is listed in the **Default space** tab of the **Element Spacing** list *(on page 215)* in the XML formatting preferences *(on page 213)*, it is promoted to the default space category

Mixed content elements list

If an element is listed in the **Mixed content** tab of the **Element Spacing** list *(on page 215)* in the XML formatting preferences *(on page 213)*, it is promoted to the mixed content category.

Element content

If an element contains mixed content, that is, a mix of text and other elements, it is promoted to the mixed content category. (Note that, in accordance with these rules, this happens even if the schema declares the element to have element only content.)

If an element contains text content, it is promoted to the default space category.

Text node content

If a text node contains any non-whitespace characters then the text node is promoted to the normalize space category.

Exception to the Rule

In general, an element can only be promoted to a more restrictive category (one that treats more whitespace as significant). However, there is one exception. In **Author** mode, if an element is marked as mixed content in the schema, but the actual element contains no text content, it can be demoted to the space ignore category if all of its child elements are displayed as *blocks* by the associated CSS (that is, they have a CSS property of `display: block`). For example, in some schemas, a section or a table entry can be defined as having mixed content but in many cases they contain only *block elements (on page 3417)*. In these cases, any whitespace they contain cannot be significant and they can be treated as space ignore elements. This exception can be turned on or off using the **Schema-Aware Editing** option *(on page 188)* in the **Schema-Aware** preferences page.

How Oxygen XML Editor formats and indents XML

You can control how Oxygen XML Editor formats and indents XML documents. This can be particularly important if you store your XML document in a version control system, as it allows you to limit the number of trivial changes in spacing between versions of an XML document. The following preference pages include options that control how XML documents are formatted:

- **Format** preferences page *(on page 210)*
- **XML Formatting** preferences page *(on page 213)*
- **Whitespaces** preferences page *(on page 216)*

When Oxygen XML Editor formats and indents XML

Oxygen XML Editor formats and indents a document, or part of it, on the following occasions:

- In **Text** mode when you select one of the format and indent actions (**Document > Source > Format and Indent**, **Document > Source > Indent Selection**, or **Document > Source > Format and Indent Element**).
- When saving documents in **Author** mode.
- When switching from **Author** mode to another mode.
- When saving documents in **Design** mode.
- When switching from **Design** mode to another mode.
- When saving or switching to **Text** mode from **Grid** mode, if the **Format and indent when passing from grid to text or on save** option *(on page 182)* is selected in the **Grid** preferences page.

Setting an Indent Size to Zero

Oxygen XML Editor will automatically format and indent *(on page 565)* documents at certain times. This includes indenting the content from the margin to reflect its structure. In some cases, you may not want your content indented. To avoid your content being indented, you can set an indent size of zero.

Note:
Changing the indent size does not override the rules that Oxygen XML Editor uses for handling whitespace when formatting and indenting XML documents. Therefore, changing the indent size will have no effect on elements that require whitespaces to be maintained.

There are two cases to consider.

Maintaining zero indent in documents with zero indent

If you have existing documents with zero indent and you want Oxygen XML Editor to maintain a zero indent when editing or formatting those documents:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Format** *(on page 210)*.
2. Select **Detect indent on open**.
3. Select **Use zero-indent if detected**.

Oxygen XML Editor will examine the indent of each document as it is opened and if the indent is zero for all lines, or for nearly all lines, a zero indent will be used when formatting and indenting the document. Otherwise, Oxygen XML Editor will use the indent closest to what it detects in the document.

Enforcing zero indent for all documents

If you want all documents to be formatted with zero indent, regardless of their current indenting:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Format** *(on page 210)*.
2. Deselect **Detect indent on open**.
3. Set **Indent size** to `0`.

All documents will be formatted and indented with an indent of zero.

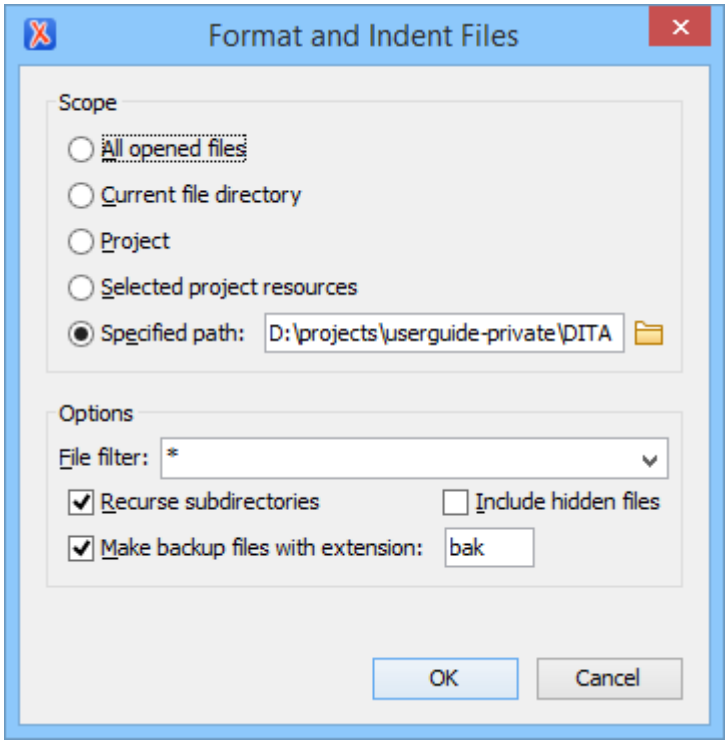
Warning:
Setting the indent size to zero can change the meaning of some file types, such as Python source files.

Format and Indent (Pretty-Print) Multiple Files

Oxygen XML Editor provides support for formatting and indenting (*pretty-print (on page 3422)*) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the **Format and Indent Files** action that is available in the contextual menu of the **Project** view *(on page 413)* or from the **Tools** menu. This opens the **Format and Indent Files** dialog box that allows you to configure options for the action.

Figure 127. Format and Indent Files Dialog Box



The **Scope** section allows you to choose from the following scopes:

- **All opened files** - The *pretty-print (on page 3422)* is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the currently edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - the *pretty-print (on page 3422)* is performed in the files located at a specified path.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the *pretty-print (on page 3422)* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the *pretty-print (on page 3422)* is also performed in the hidden files.
- **Make backup files with extension** - When selected, Oxygen XML Editor makes backup files of the modified files. The default extension is `.bak`, but you can change the extension as you prefer.

Managing Highlighted Content

While working with XML documents you often have frequent changes to the structure and content. You are often faced with a situation where you need to make a slight change in multiple places in the same document. Oxygen XML Editor includes a feature, **Manage Highlighted Content**, that is designed to help you achieve this.

When you are in **Text** mode and you perform a search operation or apply an XPath that highlights multiple results, you can access the **Manage Highlighted Content** submenu by right-clicking any of the highlights in the editing pane. If the results are displayed only in the **Results** panel at the bottom of the screen, you can use the  **Highlight all results in editor** button (on the right side of the **Results** panel) to display all the highlights in the editor (then you can access the **Manage Highlighted Content** submenu from the contextual menu of any highlight.

The following options are available in the **Manage Highlighted Content** submenu:

Modify All

Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Note:
If you select a very large number of highlights that you want to modify using this feature, a dialog box informs you that you may experience performance issues. You have the option to either use the **Find/Replace** operation *(on page 442)*, or continue the operation.

Surround All

Use this option to surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.

Remove All

Removes all the highlighted content.

If you right-click content in another part of the document, other than a highlight, you have the option to select the following option:

Modify All Matches

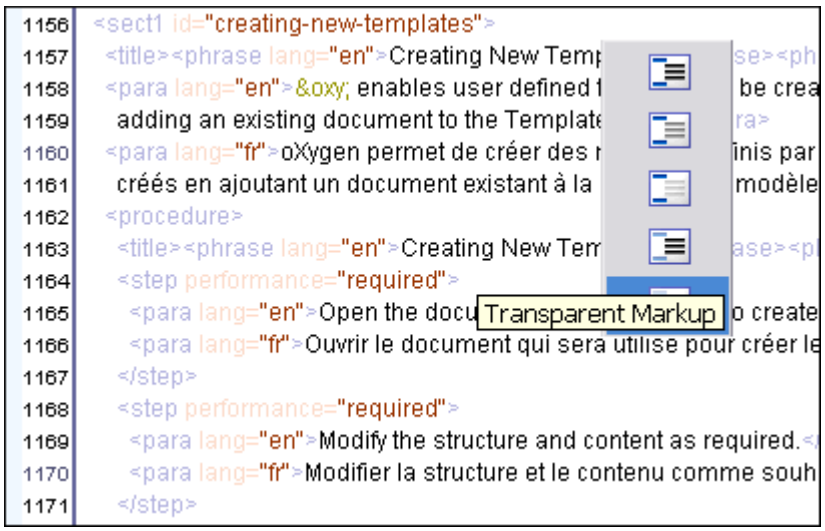
Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Adjusting the Transparency of XML Markup

Most of the time you want the content of a document displayed on screen with zero transparency. However, if you want to focus your attention only on editing text content inside XML markup, Oxygen XML Editor offers the option of reducing the visibility of the markup by increasing their transparency when displayed in **Text** mode. To change the level of transparency, use the  **Tags Transparency Selector** drop-down menu that is available from the **Source** toolbar. By default, this drop-down menu is not visible. You can add it to the toolbar by using the **Configure Toolbars** action *(on page 374)*. There are several levels of transparency that can be adjusted to make the content more or less visible:

- **Normal Contrast** - Resets the transparency level back to normal.
- **Semi-transparent Text** - Slightly reduces the visibility of text to place greater emphasis on the visibility of the XML markup.
- **Transparent Text** - Greatly reduces the visibility of text to place even greater emphasis on the visibility of the XML markup.
- **Semi-transparent Markup** - Slightly reduces the visibility of the XML markup to place greater emphasis on the visibility of the text.
- **Transparent Markup** - Greatly reduces the visibility of the XML markup to place even greater emphasis on the visibility of the text.

Figure 128. Tags Transparency Selector



Locking and Unlocking XML Markup

For documents with fixed markup, such as forms that do now allow the XML tags to be modified (only their text content), the possibility to edit the XML tag names can be toggled on or off with the **Lock / Unlock the XML tags** action available in **Text** editing mode from the **Source** submenu from the contextual menu (or **Document > Source** menu).

You can set the default lock state for all opened editors using the **Lock the XML tags** option in the **Text** preferences page *(on page 180)*.

Special Character Support in Text Mode

If bidirectional text, such as Arabic or Hebrew languages, certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters (such as combining characters) are detected in a document, Oxygen XML Editor displays a **Special Characters Detected** dialog box that prompts you to **Enable** or **Disable** support for these special characters (you can also enable or disable the support for special characters in the **Open** preferences page *(on page 208)*.

Enabled

If you choose to enable support for special characters and as long as you chose a font *(on page 140)* that supports the particular special characters, this means that the *glyphs* will be rendered properly in **Text** mode and the cursor navigation mechanism will recognize them as they are shown.

Example: The Ậ glyph could be inserted using a consecutive combination of two characters (**U+00C2** followed by **U+0323**). With the special characters support enabled and the **SansSerif** font chosen, that glyph will be rendered properly (a capital letter A with a circumflex above it and a dot below) and you can navigate through the glyph in one step (pressing the right/left arrow key once).

Restriction:
When support for special characters is enabled, the *folding* support *(on page 538)* is not available.

Disabled

If you choose to disable support for special characters, it may affect text rendering, cursor navigation, and text management operations. However, this is helpful if you need to open very large documents *(on page 479)* since disabling the bidirectional editing support can enhance performance.

Example: The Ậ glyph could be inserted using a consecutive combination of two characters (**U+00C2** followed by **U+0323**). With the special characters support disabled, that glyph may or may not be rendered properly and when navigating through the glyph, it would take two steps (pressing the right/left arrow key twice).

Restriction:
Bidirectional content in the **Text** mode cannot be rendered using **Bold** or **Italic**.

Special Character Support in Author Mode *(on page 763)*
Special Character Support in Grid Mode *(on page 596)*
Inserting Special Characters with the Character Map *(on page 475)*

Inserting or Opening a File at Cursor Location

When editing content in **Text** mode, the following actions (with regard to inserting, opening, or comparing files) are available in the **Document > File** menu:

Insert File

Inserts the content of the file with the specified file path into the current document at the current position of the cursor.

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel. If the file is an image file, it will be opened in the **Image Preview** pane *(on page 479)*.

Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at the cursor position. The target is opened in the default system application associated with that file type.

Compare

Opens the current file in the **Compare Files** tool *(on page 484)*.

Ctrl + Single-Click (Command + Single-Click on macOS)

Use this shortcut to open any of the following:

- Any absolute URL (URLs that have a protocol), regardless of their location in the document.
- URI attributes such as: `@schemaLocation`, `@noNamespaceSchemaLocation`, `@href` and others.
- Open the target for DITA references (such as a `@conref`, `@conkeyref`, `@keyref`, and more).
- Processing instructions used for associating resources, xml-models, xml-stylesheets.

Quick Assist Support for IDs and IDREFS

The *Quick Assist* support *(on page 3423)* is activated automatically when you place the cursor inside an ID or IDREF in **Text** mode. To access it, click the yellow bulb help marker placed on the current line, in the

line number stripe of the editor. You can also invoke the *Quick Assist* menu from the contextual menu or by pressing **Alt+1** **(Command+Alt+1 on macOS)** on your keyboard.

The following actions are available:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** dialog box, this scope will be used instead.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** dialog box, this scope will be used instead.

Change scope

Opens the **Select the scope for the Search and Refactor operations** *(on page 843)* dialog box.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

Search Occurrences

Searches for the declaration an references of the ID located at the cursor position in the current document.

Related Information:
Modular Contextual XML Editing Using 'Main Files' Support *(on page 841)*

Highlight ID Occurrences in Text Mode

To see the occurrences of an ID in an XML document in the **Text** mode, place the cursor inside the ID declaration or reference. The occurrences are marked in the vertical side bar at the right of the editor. Click a marker on the side bar to jump to the occurrence that it corresponds to. The occurrences are also highlighted in the editing area.

Note:
Highlighted ID declarations are rendered with a different color than highlighted ID references. To customize these colors or disable this feature, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Mark Occurrences** *(on page 234)*.

Related Information:
Modular Contextual XML Editing Using 'Main Files' Support *(on page 841)*

Contextual Menu Actions in Text Mode

When editing XML documents in **Text** mode, Oxygen XML Editor provides the following actions in the contextual menu (many of them also appear in the submenus of the **Document** menu):

Add File to Review Task

This action can be used to add the current document to a task in the **Content Fusion Tasks Manager** view. **Oxygen Content Fusion** is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on *(on page 2651)*. To fully take advantage of all of the benefits and features of **Content Fusion**, your organization will need an **Oxygen Content Fusion Enterprise Server**. For more information, see the **Oxygen Content Fusion** website.

Cut, Copy, Paste

Executes the typical editing actions on the currently selected content.

Copy XPath

Copies the XPath expression of the current element or attribute (or property for JSON documents) to the clipboard.

Toggle Line Wrap (Ctrl + Shift + Y (Command + Shift + Y on macOS))

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

Toggle Comment (Ctrl + Shift + Comma (Command + Shift + M on macOS))

Comments the current selection of the current editor. If the selection already contains a comment the action removes the comment from around the selection. If there is no selection in the current editor and the cursor is not positioned inside a comment, the current line is commented. If the cursor is positioned inside a comment, then the commented text is uncommented.

Go to submenu

This submenu includes the following actions:

Go to Matching Tag (Ctrl + Shift + G (Command + Shift + G on macOS))

Moves the cursor to the end tag that matches the start tag, or vice versa.

Go after Next Tag (Ctrl + CloseBracket (Command + CloseBracket on macOS))

Moves the cursor to the end of the next tag.

Go after Previous Tag (Ctrl + OpenBracket (Command + OpenBracket on macOS))

Moves the cursor to the end of the previous tag.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Attributes

Selects all the attributes of the element at the current cursor position.

Parent

Selects the parent element at the current cursor position.

Source submenu

This submenu includes the following actions:

 **Shift Right (Tab)**

Shifts the currently selected block to the right.

 **Shift Left (Shift + Tab)**

Shifts the currently selected block to the left.

 **Indent selection (Ctrl + I (Command + I on macOS))**

Corrects the indentation of the selected block of lines if it does not follow the current indenting preferences *(on page 210)*.

 Escape Selection

Escapes a range of characters by replacing them with the corresponding character entities.

 **Unescape Selection**

Replaces the character entities with the corresponding characters.

 **Format and Indent Element (Ctrl + Shift + I (Command + Shift + I on macOS))**

Pretty-prints (on page 3422) the element that surrounds the current cursor position.

To Upper Case

Converts the selected content to upper case characters. This works with contiguous and multiple selections.

To Lower Case

Converts the content selection to lower case characters. This works with contiguous and multiple selections.

Capitalize Lines

It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character *(on page 473)*. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `E`
- `0X0125` to `ĥ`
- `265` to `ɩ`
- `2190` to `←`

Note:
For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent *(on page 476)*.

Base64 Encode/Decode submenu

This submenu include the following actions for encoding or decoding **base 64** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(on page 176)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(on page 317)*.

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(on page 176)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(on page 317)*.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Base32 Encode/Decode submenu

This submenu include the following actions for encoding or decoding **base32** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(on page 176)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(on page 317)*.

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(on page 176)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(on page 317)*.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Hex Encode/Decode submenu

This submenu include the following actions for encoding or decoding **hex** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(on page 176)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(on page 317)*.

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(on page 176)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(on page 317)*.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Join and Normalize Lines (Ctrl + J (Command + J on macOS))

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

Insert new line after (Ctrl + Alt + Enter (Command + Option + Enter on macOS))

This action has the same result as moving the cursor to the end of the current line and pressing the *ENTER* key.

 **Insert XInclude**

Displays a dialog box that allows you to browse and select the content to be included and automatically generates the corresponding XInclude instruction.

> **Note:**
> In the **Author** mode, this dialog box presents a preview of the inserted document as an author page in the **Preview** tab and as a text page in the **Source** tab. In the **Text** mode, the **Source** tab is presented.

Import entities list

Displays a dialog box that allows you to select a list of files as sources for external DTD entities. The internal subset of the DOCTYPE declaration of your document will be updated with the chosen entities. For instance, choosing the files `chapter1.xml` and `chapter2.xml` inserts the following section in the DOCTYPE:

```
<!ENTITY chapter1 SYSTEM "chapter1.xml">
<!ENTITY chapter2 SYSTEM "chapter2.xml">
```

Lock / Unlock the XML Tags

Disables or enables the ability to edit XML tags.

Canonicalize

Opens the **Canonicalize** dialog box that allows you to select a *canonicalization (on page 3418)* algorithm to standardize the format of the document.

Sign

Opens the **Sign** dialog box that allows you to configure a digital signature for the document.

Verify Signature

Allows you to specify the location of a file to verify its digital signature.

Manage Highlighted Content submenu

This submenu is available from the contextual menu when it is invoked from a highlight after you perform a search operation or apply an XPath expression that highlights more than one result. The following options are available in this submenu:

Modify All

Allows you to modify (in-place) all the occurrences of the selected content. A thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Surround All

Surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.

Remove All

Removes all the highlighted content.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

 **Go to Definition (Ctrl + Shift + Enter)**

Navigates to the definition of the current element or attribute in the schema (DTD, XML Schema, Relax NG schema) associated with the edited XML document. If the current attribute is a *"type"* belonging to the *"http://www.w3.org/2001/XMLSchema-instance"* namespace, the cursor is moved in the XML schema to the definition of the type referenced in the value of the attribute. For JSON documents, it navigates to the definition of the current JSON property in the associated JSON Schema.

Refactoring submenu

This submenu includes the following actions:

 **Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

 **Rename Prefix (Alt + Shift + P (Command + Shift + P on macOS))**

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Editor will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from `p1` to `p5`. If `p5` is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from `p1` to `p5` without inserting a new declaration.

- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

Surround with submenu

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

Surround with Tags (Ctrl + E (Command + E on macOS))

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option *(on page 220)* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option *(on page 220)* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on macOS))

Surround the selected content with the last tag used.

Delete element tags (Alt + Shift + X (Command + Option + X on macOS))

Deletes the start and end tag of the current element.

Split element (Alt + Shift + D (Ctrl + Option + D on macOS))

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

Join elements (Alt + Shift + J (Command + Option + J on macOS))

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema (not available for DITA). It includes the following actions:

 **Rename in**

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

 **Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the **Select the scope for the Search and Refactor operations** *(on page 843)*.

 **Search Declarations**

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** dialog box, this scope will be used instead.

Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the **Select the scope for the Search and Refactor operations** *(on page 843)*.

 **Search Occurrences in file**

Searches for the declaration and references of the ID in the current document.

Quick Assist (Alt + 1 (Command + Option + 1 on macOS))

Available when the cursor is inside an ID or IDREF, this action opens the *Quick Assist (on page 3423)* window that allows you to select some search and refactoring actions for the selected ID or IDREF.

Apply all default quick fix proposals

Available when one or more quick fix proposals have been detected for the reported validation errors. If multiple quick fixes are available for the same validation error, only the first one presented is executed. All selected quick fix proposals will be automatically executed in bulk, one after the other.

Important Notes to Consider:

- To maintain the accuracy of the initially calculated error validation ranges, the quick fix proposals are applied in the reverse order of their selection.
- If two or more quick fixes act on the same "area" within the document, only one is applied (no changes can be made to changes already made).
- Quick fixes that involve "user-entered values" that normally present a dialog box to facilitate data entry will not be executed (the automatic process of applying all selected quick fixes cannot be interrupted by the presence of the respective dialog boxes).

Once the analysis of the impact of applying the quick fixes on the content is complete, a preview dialog box is presented that provides an overview of the content changes that will be made, according to the quick fixes that will be applied. If you agree with the changes presented, the actual procedure of applying the quick fixes and updating the content is triggered.

Open submenu

The following actions are available in this submenu:

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel. If the file is an image file, it will be opened in the **Image Preview** pane *(on page 479)*.

Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at the cursor position. The target is opened in the default system application associated with that file type.

Compare

Opens the current file in the **Compare Files** tool *(on page 484)*.

Show referenced resources

Opens the **Referenced/Dependent Resources** view *(on page 844)* that allows you to see the referenced resource hierarchy for an XML document.

Show dependent resources

Opens the **Referenced/Dependent Resources** view *(on page 844)* that allows you to see the resource dependencies for an XML document.

Editing XML Documents in Grid Mode

This section includes topics that describe how to work with XML documents in **Grid** mode, including various features, actions that are available, and much more.

The **Grid** mode in Oxygen XML Editor displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup.

To switch to this mode, select **Grid** at the bottom of the editing area. 

You can easily expand or collapse elements within the table and the document structure can be changed with simple contextual menu actions, drag/drop, or copy/paste operations. The text content can be modified simply by editing the value of cells that contain the text and a useful *Content Completion Assistant (on page 3418)* is also available to help you edit or insert XML elements.

Resources

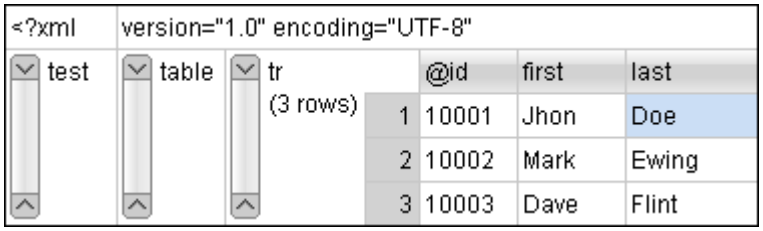
For more information about some of the features available in the **Grid** editor, watch our video demonstration:

https://www.youtube.com/embed/PoYm2VqisWk

Layouts: Grid and Tree

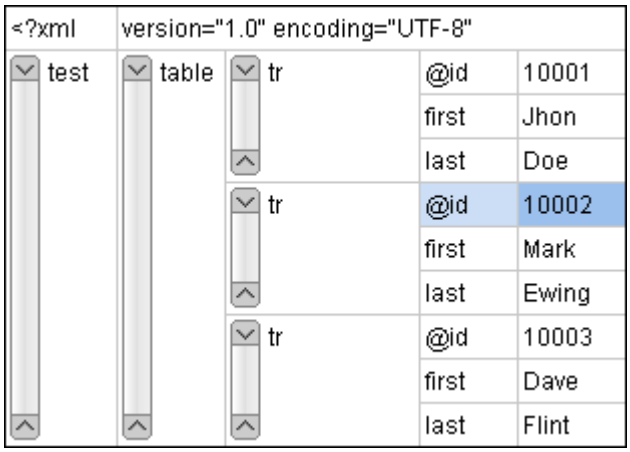
The **Grid** editor offers two layout modes. The default one is the grid layout. This smart layout detects the recurring elements in the XML document and creates tables having the children (including the attributes) of these elements as columns. This way, it is possible to have tables nested in other tables, reflecting the structure of your document.

Figure 129. Grid Layout



The other layout mode is tree-like. It does not create any tables and it only presents the structure of the document.

Figure 130. Tree Layout



To switch between the two modes, select **Document > Grid Layout > Grid mode/Tree mode**.

Grid Mode Navigation

When you first open a document in **Grid** mode, the content is collapsed. Only the root element and its attributes are displayed. An arrow sign ( ) displayed at the left of the node name indicates that this node has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign ( ). The expand/collapse actions can also be invoked with the **NumPad+** and **NumPad-** keys, or from the **Expand/Collapse** submenu of the contextual menu or from **Document > Grid Expand/Collapse**.

Expand/Collapse Submenu

The following actions are available on the **Expand/Collapse** submenu:

Expand All

Expands the selection and all its children.

Collapse All

Collapses the selection and all its children.

Expand Children

Expands all the children of the selection but not the selection.

Collapse Children

Collapses all the children of the selection but not the selection.

Collapse Others

Collapses all the siblings of the current selection but not the selection.

Keyboard Shortcuts

A variety of other keyboard shortcuts are also available in **Grid** mode:

Table 4. Shortcuts in the Grid Mode

Key	Action
Tab	Moves the cursor to the next editable value in a table row.
Shift + Tab	Moves the cursor to the previous editable value in a table row.
Enter	Begins editing and lets you insert a new value. Also commits the changes after you finish editing.
UpArrow/PageUp	Navigates toward the beginning of the document.
DownArrow/PageDown	Navigates toward the end of the document.
Shift	Used in conjunction with the navigation keys to create a continuous selection area.
Ctrl (Command on macOS) key	Used in conjunction with the mouse cursor to create discontinuous selection areas.

The following key combinations can be used to scroll the grid:

- **Ctrl + UpArrow (Command + UpArrow on macOS)** - scrolls the grid upwards.
- **Ctrl + DownArrow (Command + DownArrow on macOS)** - scrolls the grid downwards.
- **Ctrl + LeftArrow (Command + LeftArrow on macOS)** scrolls the grid to the left.
- **Ctrl + RightArrow (Command + RightArrow on macOS)** scrolls the grid to the right.

Related Information:
Editing Actions in Grid Mode *(on page 591)*

Editing Actions in Grid Mode

Since **Grid** mode presents XML content in a structured grid of nested tables, editing content in this mode can be done with a combination of the *Content Completion Assistant (on page 596)* and actions that allow you to work with the structure or content of the nested tables much like you would with any table. Oxygen XML Editor provides ways to edit content in the cells of the nested tables or to edit the structure of the tables.

Tip:
There are two different types of layouts available in **Grid** mode. Most people prefer to leave it on the default **Grid mode** layout, but there is also a **Tree mode** layout that presents the structure of the document in more of a vertical tree-like manner. You can switch between the two layouts to see which one works best for you particular situation from the **Document > Grid Layout** menu.

Expanding/Collapsing Nodes

An arrow sign () displayed at the left of a node indicates that it has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (). The expand/collapse actions

can also be invoked with the **NumPad+** and **NumPad-** keys, or from the **Expand/Collapse** submenu of the contextual menu.

To expand all child nodes, right-click the cell that contains the parent node and select **Expand All** from the **Expand/Collapse** submenu. To collapse all node, right-click any cell and select **Collapse All** from the **Expand/Collapse** submenu.

Editing Elements or Attributes

To edit elements or attributes in **Grid** mode, simply double-click the cell that contains the element or attribute (or select the cell and press **Enter**) to invoke the *Content Completion Assistant (on page 596)*. This opens a pop-up window that offers a list of proposals that are valid for that particular node.

Editing Text Content in Cells

To edit the text value of a cell, simply select the grid cell and press **Enter** (or double-click the cell), and start editing.

To stop editing a cell value, press **Enter** again.

To cancel the editing without saving the current changes in the document, press the **Esc** key.

Editing the Structure of the Nested Tables

To edit the structure of the nested tables in **Grid** mode, Oxygen XML Editor provides the following actions in the contextual menu (many of them also appear in the submenus of the **Document** menu, or the toolbar):

Cut, Copy, Paste, Delete common editing actions

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content.

Paste as Child

Pastes the copied content as the last child of the current selection.

Duplicate

Creates a new node by duplicating the currently selected one.

Insert Before

Offers a list of valid nodes, depending on the context, and inserts your selection before the currently selected node, as a sibling.

Insert After

Offers a list of valid nodes, depending on the context, and inserts your selection after the currently selected node, as a sibling.

Append Child

Offers a list of valid nodes, depending on the context, and appends your selection as a child of the currently selected node.

Sort Ascending, **Sort Descending**

The sorting result depends on the data type of the column content. It could be a numerical sorting for numbers or an alphabetical sorting for text information. The editor automatically analyzes the content and decides what type of sorting to apply. When a mixed set of values is present in the sorted column, a dialog box is displayed that allows you to choose the desired type of sorting between *numerical* and *alphabetical*.

Insert Row

Inserts a new row below the current selection. To insert a new row, you could also select the row header (the zone to the left of the row that holds the row number) and press **Enter**.

Insert Column

Inserts a column after the current selection.

Clear Content

Removes all content from the current cell.

Expand/Collapse > Expand All

Expands the selection and all its children.

Expand/Collapse > Collapse All

Collapses the selection and all its children.

Expand/Collapse > Expand Children

Expands all the children of the selection but not the selection.

Expand/Collapse > Collapse Children

Collapses all the children of the selection but not the selection.

Expand/Collapse > Collapse Others

Collapses all the siblings of the current selection but not the selection.

Refresh Selected

Forces the layout to be recomputed.

Related Information:

Grid Mode Navigation *(on page 590)*
Copy and Paste in the Grid Editing Mode *(on page 594)*
Drag and Drop in the Grid Editing Mode *(on page 593)*
Content Completion Assistant in Grid Mode *(on page 596)*

Drag and Drop in the Grid Editing Mode

You can easily arrange sections in your XML document in the **Grid** mode by using drag and drop actions.

You can do the following with drag and drop:

- Copy or move a set of nodes.
- Change the order of columns in the tables.
- Move the rows from the tables.

These operations are available for both single and multiple selections. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on macOS)**.

While dragging, the editor paints guide-lines showing the locations where you can drop the nodes. You can also drag nodes outside the **Grid** editor and text from other applications into the **Grid**.

Tip:
When using drag and drop to reorganize the document, the resulting layout can be different from what you expected. For instance, the layout can contain a set of sibling tables that can be joined together. To force the layout to be recomputed, you can use the **Refresh Selected** action that is available in the contextual menu and in the **Document > Grid Edit** menu.

Copy and Paste in the Grid Editing Mode

Selecting content in the **Grid** mode is similar to working with any table with a little more complexity. Specifically, depending on the type of node, when you select a cell, the selection may automatically include additional cells that are implied by the currently selected node. For example, if you click a node that contains any child nodes, all cells that contain the parent and child nodes will be selected. In this case, the currently selected cell is painted with a color that is different from the rest of the selection.

You can also select discontinuous regions of nodes and place them in the clipboard with the copy action. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on macOS)**.

Pasting Content Within Grid Mode

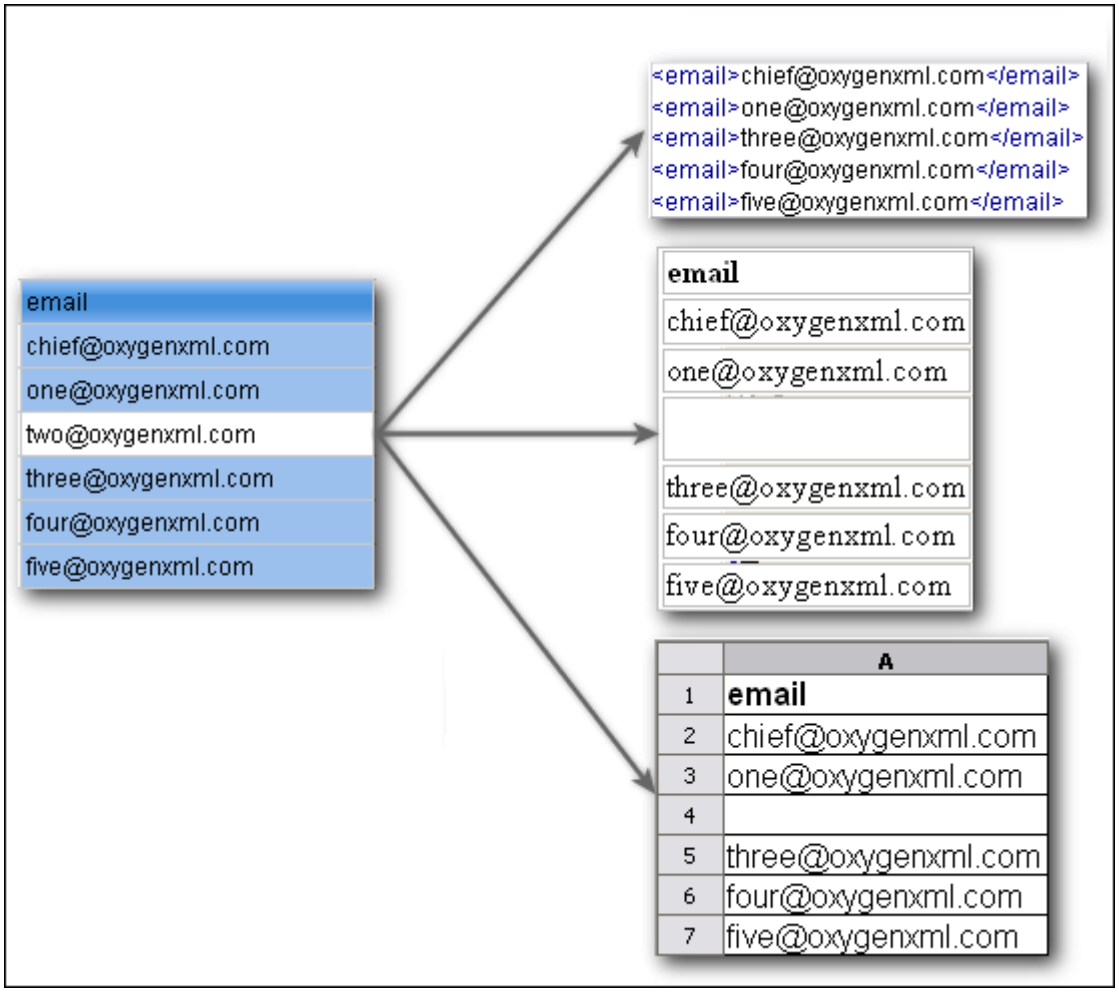
You can paste copied nodes relative to the currently selected cell using one of the following actions (available in the contextual menu):

- **Paste (Ctrl + V (Command + V on macOS))** - Pastes copied content, as a sibling, just below (after) the current selection.
- **Paste as Child** - Pastes copied content as the last child of the current selection.

Pasting Content from Grid Mode to Other Editors

Nodes that are copied from the **Grid** editor can also be pasted into **Text** mode or other external applications. When pasting copied content from **Grid** mode, the inserted string represents the nodes serialization. The nodes from tables can be copied using HTML or RTF in table format. The resulting cells contain only the concatenated values of the text nodes.

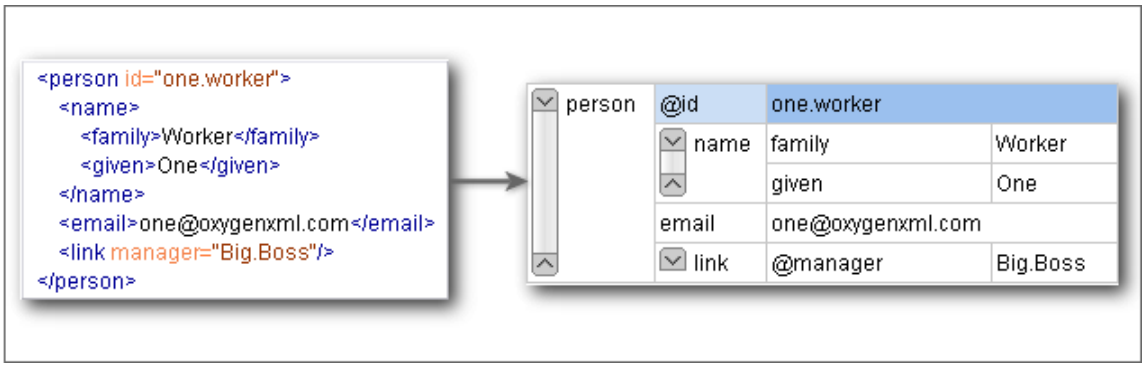
Figure 131. Copying from Grid to Other Editors



Pasting Content from Other Editors into Grid Mode

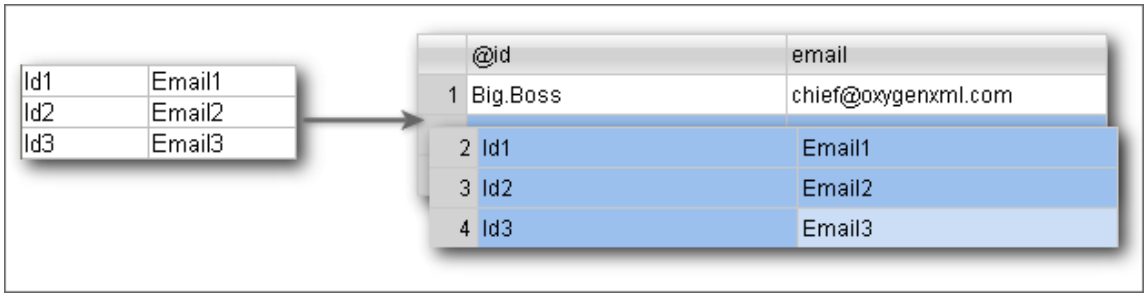
You can also paste well-formed XML content or tab-separated values from other editors into the **Grid** editor. If you paste XML content, the result will be the insertion of the nodes obtained by parsing this content.

Figure 132. Pasting XML Data into Grid



If the pasted text contains multiple lines of tab-separated values, it can be considered as a matrix of values. By pasting this matrix of values into the **Grid** editor, the result will be a matrix of cells. If the operation is performed inside existing cells, the existing values will be overwritten and new cells will be created when needed.

Figure 133. Pasting Tab-Separated Values into Grid



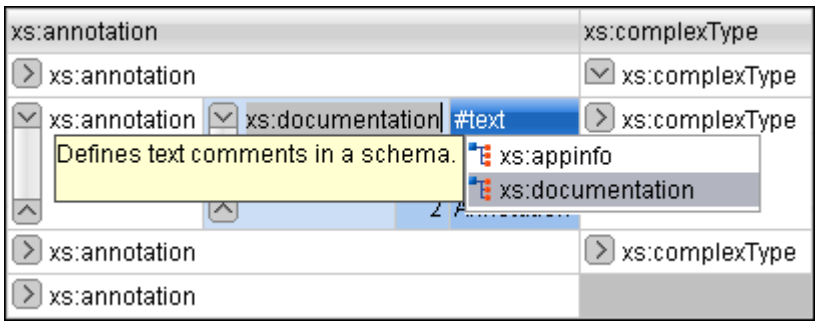
If you need to add copied content to your existing content (rather than overwriting existing cells), you need to first insert new cells by using the **Insert row** or **Insert column** actions from the contextual menu. This is useful, for example, when trying to transfer data from spreadsheet-like editors to the **Grid** editor.

Content Completion Assistant in Grid Mode

If the edited document is associated with a schema (DTD, XML Schema, Relax NG, etc.), the **Grid** editing mode offers a *Content Completion Assistant (on page 3418)* for the names and values of elements and attributes. If you choose to insert an element that has required content, the sub-tree of needed elements and attributes are also automatically included.

To display the content completion pop-up menu, simply double-click a cell that contains an element or attribute (or press **Enter** on your keyboard).

Figure 134. Content Completion in Grid Editing Mode



Special Character Support in Grid Mode

If you are editing documents with a bidirectional text orientation or other special characters (such as combining characters), you can change the way the text is rendered and edited in the grid cells by using the **Change Text Orientation**(**Ctrl + Shift + O (Command + Shift + O on macOS)**) action that is available from the **Edit** menu in the **Grid** editing mode. Use this action to switch from the default left to right text orientation to the right to left orientation, and vice versa.

Note:
This change applies only to the text from the cells, and not to the layout of the grid editor.

Figure 135. Default left to right text orientation

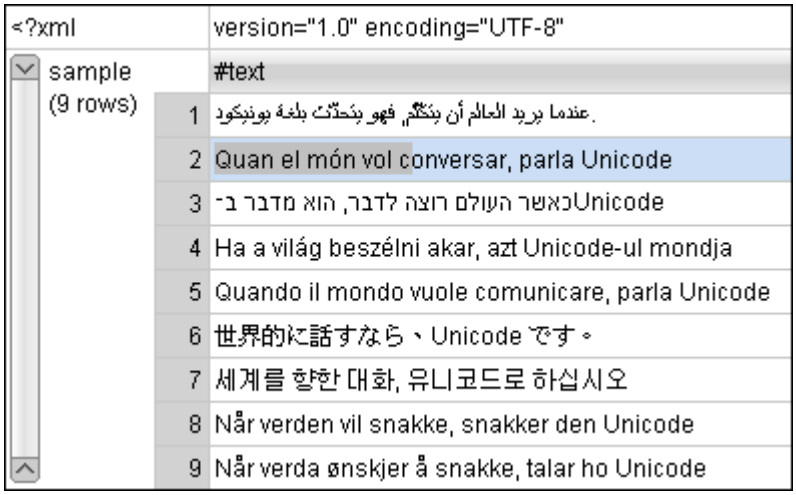


Figure 136. Right to left text orientation

Exporting XML Content to Excel

For use-cases where you have XML content that needs to be exported to Excel (or any other spreadsheet application) but the content is not already in some sort of table format, **Grid** mode offers you a way to display the content of an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. This makes it possible to export content to Excel by copying cells that contain the specific content and then pasting the copied cells in Excel the same as you would when working with any table or spreadsheet.

To export XML content from **Grid** mode to Excel or other spreadsheet applications, follow this procedure:

1. Open the XML document in Oxygen XML Editor and switch to **Grid** mode.
2. Expand the nodes *(on page 591)* to gain access to the particular nested table that contains the content you want to export.
3. Copy the cells that contain the content you want to export ( **Copy** from the contextual menu or **Ctrl +C**).
4. Switch to your spreadsheet application and paste the copied cells.
5. You may need to make some manual adjustments depending on the complexity of the structure in the original XML document.

Note that Oxygen XML Editor also supports the reverse scenario (copying cells from a spreadsheet application and pasting them in **Grid** mode). For more information, see Import from MS Excel Files – Grid Mode Method *(on page 2207)*.

Resources

For more information about exchanging data between Oxygen XML Editor and spreadsheet applications, watch our video demonstration:

Editing XML Documents in Author Mode

This section includes topics that describe how to work with XML documents in **Author** mode, including its various features, actions that are available, and much more.

The **Author** editing mode in Oxygen XML Editor allows you to visually edit XML documents in a user-friendly interface that is similar to a WYSIWYG word processor. This makes structured authoring easier for people who are not familiar with XML and it also provides easier access to the XML structure for XML experts. Oxygen XML Editor provides support for visually editing the most commonly used XML vocabularies in **Author** mode, including DITA, Doc Book, TEI, and XHTML.

Adding text content in **Author** mode is as simple as doing so in a standard text editor but the content is rendered similar to how you see it in the output. Tables, images, and media objects (such as videos) are also rendered comparable to the output. You can even play audio and video objects directly in **Author** mode and it includes an intuitive Image Map Editor *(on page 735)*. You can easily change the rendering by selecting one of the preset *main styles (on page 3421)* from the **Styles** drop-down menu *(on page 600)* (available on the toolbar) and combine multiple *alternate styles (on page 3417)* that behave like layers. You can also use the options in the  **Tags Display Mode** drop-down menu *(on page 604)* to control how much XML markup is displayed in **Author** mode and there are various features and views that provide information about the XML structure based on your current location within the document.

Author mode provides numerous helpful editing actions, many of which are specific to the type of document you are editing and it includes a variety of other powerful editing features, such as keyboard shortcuts, drag and drop support *(on page 622)*, a *Smart Paste* mechanism *(on page 623)*, and an intelligent *Content Completion Assistant (on page 626)*. **Author** mode also allows you to visualize and manage profiled content *(on page 680)*, you can collaborate with others with various review features *(on page 652)* (such as the ability to add comments, track changes, or highlight content), and includes many other unique features.

To switch to this mode, click the **Author** button at the bottom of the editing area. 

Resources

For more information about some of the features available in the visual **Author** editing mode, watch our video demonstration:

https://www.youtube.com/embed/bnQwJZD58wY

Author Mode User Roles

There are two main types of users for the **Author** mode: *framework developers* and *content authors*.

Framework Developers

A *framework developer* is a technical person with advanced XML knowledge who defines the *framework (on page 3420)* for authoring XML documents in the visual editor. Once the *framework* is created or edited by the developer, it is distributed as a deliverable component ready to plug into the application for the content authors.

The *framework* (document type) configuration defines a type of XML document by specifying all the details needed for editing the content of XML documents in **Author** mode.

The *framework* details that are created and customized by the developer include:

- The CSS stylesheet that drives the visual rendering of the document.
- The rules for associating an XML schema with the document, which is needed for the content completion assistance and validation of the document.
- Transformation scenarios for the document.
- Configuration of *XML Catalogs (on page 3425)*.
- Custom actions available as buttons on the toolbar or in menus.

Oxygen XML Editor includes some ready-to-use built-in document types for XML *frameworks*, such as DocBook, DITA, TEI, JATS, and XHTML.

Content Authors

A *content author* does not need to have advanced knowledge about XML markup, operations such as validation of XML documents, or applying XPath expressions to an XML document. The content author

just uses the *framework* set up by the developer in the application and starts editing the content of XML documents without editing the XML tags directly.

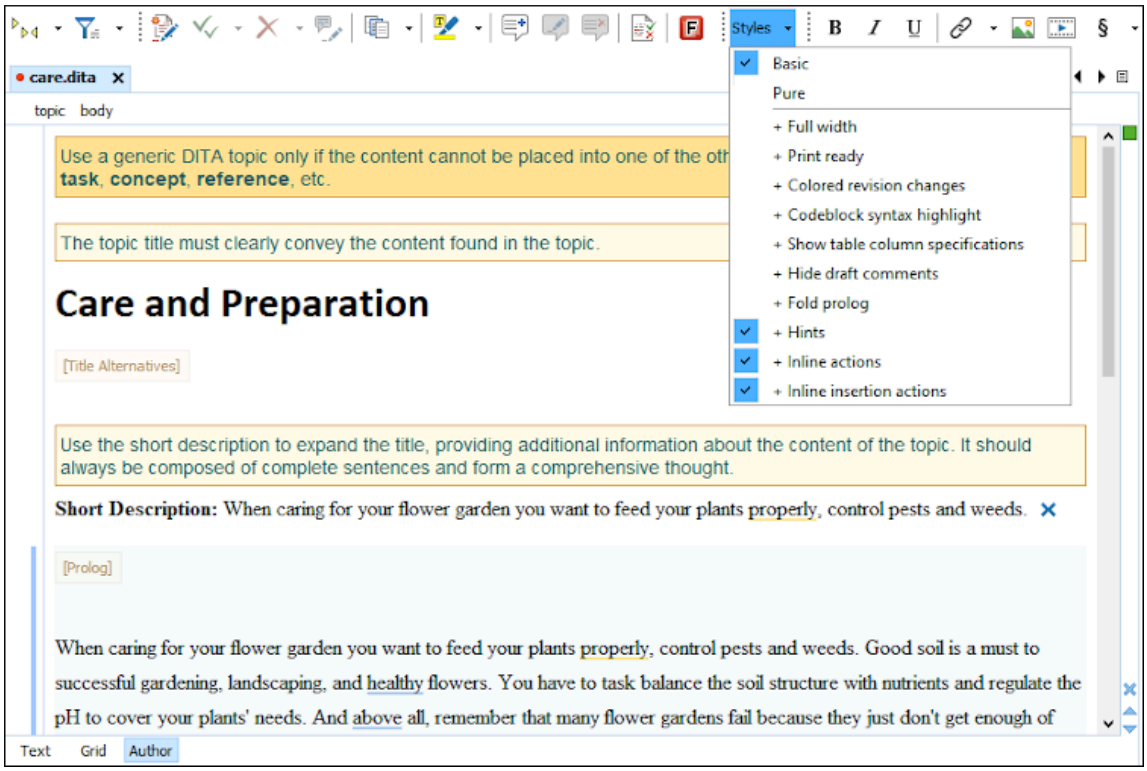
Changing the Look of Documents in Author Mode Using the Styles Menu

The **Author** mode renders the content of the XML documents visually, based on CSS stylesheets associated with the document.

Oxygen XML Editor provides a **Styles** drop-down menu on the toolbar that allows you to select one *main (non-alternate) CSS style (on page 3421)* and multiple *alternate CSS styles (on page 3417)*. This makes it easy to change the look of the document as it appears in **Author** mode.

The list of CSS styles that are available in the **Styles** menu depend on the *framework (on page 3420)* (document type).

Figure 137. Styles Drop-down Menu in a DITA Document



You can use the **Styles** drop-down menu to select a *main css style (on page 3421)* that applies to the whole document and then select one or more *alternate css styles (on page 3417)* that behave like layers and are merged sequentially with the *main style*. Each of the styles that are listed in this drop-down menu have a corresponding CSS file that defines how your documents are rendered in **Author** mode and in the output. Also, the selections from this drop-down menu are persistent, meaning that Oxygen XML Editor remembers them when subsequent documents are opened.

Main CSS Styles

The *main styles* are listed in the top section and each of their corresponding CSS files contain all the styles associated with the XML elements for the particular type of document. You can only select one main style at a time.

Alternate CSS Styles

The *alternate styles* are listed in the bottom section and their corresponding CSS files contain additional styling for certain XML elements and are merged with the selected *main styles*. You can select as many alternate styles as you wish (they are applied sequentially as layers). If you are unsure about how each of the styles with change the look of your documents based solely upon their name, there is no harm in selecting them to see the difference. You can simply deselect them to revert to the previous look.

Note:
If you deselect the **Enable multiple selection of alternate CSSs** option *(on page 154)* in the **CSS** subtab of the **Document Type** configuration dialog box *(on page 147)*, the *alternate styles* are treated like *main CSS styles* and you can only select one at a time.

Tip:
For information about configuring the **Styles** drop-down menu, see Configuring and Managing Multiple CSS Styles for a Framework *(on page 2262)*.

Associating a Schema to XML Documents *(on page 827)*
Configuring and Managing Multiple CSS Styles for a Framework *(on page 2262)*

Navigating the Document Content in Author Mode

Oxygen XML Editor includes some useful features to help you navigate XML documents.

Navigation Keyboard Shortcuts

Tab

Navigate to the next XML node.

Tip:
If you encounter a *space-preserved element (on page 3424)* when you navigate through a document and you do not press another key, pressing the **Tab** key will continue the navigation. However, if the cursor is positioned in a *space-preserved element* and you press another key or you position the cursor inside such an element using the mouse, the **Tab** key can be used to arrange the text.

Shift + Tab

Navigate to the previous XML node.

Ctrl + RightArrow (Command + RightArrow on macOS)

Navigate one word forward.

Ctrl + LeftArrow (Command + LeftArrow on macOS)

Navigate one word backward.

Ctrl + Home (Command + Home on macOS)

Position the cursor at the beginning of the document.

Ctrl + End (Command + End on macOS)

Position the cursor at the end of the document.

Navigating to a Modification

Oxygen XML Editor includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar (they can also be accessed from the **Find** menu):

Last Modification

Navigates to the last modification in any open tab.

Back

Navigates to the last selected editor tab or to the last selected element/content in the current tab. You can also go back after clicking on links in **Text** or **Author** mode.

Forward

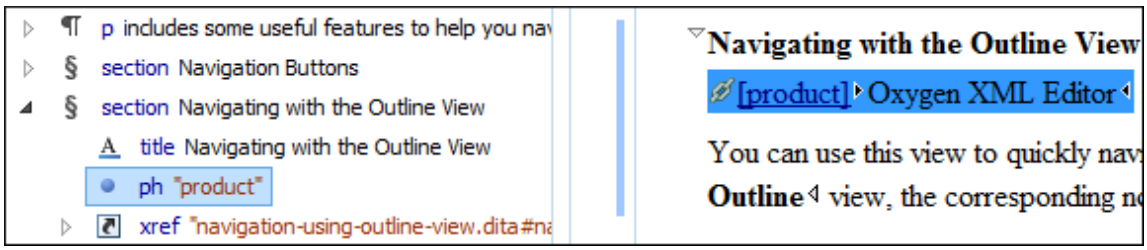
Available after you use the **Back** button at least once, and it navigates in the opposite direction as the **Back** button.

Navigating with the Outline View

Oxygen XML Editor includes an **Outline** view *(on page 549)* that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

Figure 138. Outline View Navigation in Author Mode



Using the Breadcrumb to Navigate

A *breadcrumb* on the stripe at the top of the document indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 139. Breadcrumb in Author Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

Using the Linking Support

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc.), the **linking support** is useful for navigating between the documents. In the built-in frameworks that are bundled with Oxygen XML Editor, links are marked with the icon (or the icon for key-based references). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system browser. The same effect can be obtained by using the **Document > File > Open file at cursor (Ctrl + Enter (Command + Enter on macOS))** action when the cursor is inside a link element.

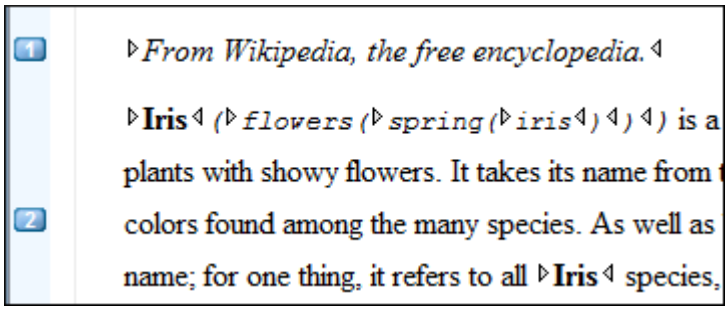
Note:
Depending on the referenced file type, the target link will either be opened in the Oxygen XML Editor or in the default system application. If the target file does not exist, Oxygen XML Editor prompts you to create it.

Navigating with Bookmarks

A position in a document can be marked with a *bookmark*. You can then quickly go to the marked position with a keyboard shortcut or a menu action. This is useful when navigating large documents or working on multiple documents where the cursor needs to move between several marked positions. The *bookmarks* are displayed with a small icon on the vertical strip to the left of the editor. You can place up to nine distinct *bookmarks* in any document. Shortcut keys are available to navigate to any of the marked positions (**Ctrl+1** through **Ctrl+9**).

There are also shortcuts for creating bookmarks (**Ctrl+Shift+1** through **Ctrl+Shift+9**). You can also configure these shortcut keys in the **Options > Menu Shortcut Keys** *(on page 303)* menu.

Figure 140. Editor Bookmarks



To insert a *bookmark* in **Author** mode, do any of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Press **F9** on your keyboard or use any of the specific bookmark creation shortcuts ((**Ctrl+Shift+1** through **Ctrl+Shift+9**).
- Select the **Create Bookmark** action from the **Edit > Bookmarks** menu.

To remove *bookmark* in **Author** mode, do either of the following:

- Left-click its icon in the vertical stripe.
- Right-click its icon on the vertical stripe and select **Remove** or **Remove all (Ctrl+F7 (Command+F7 on macOS))**.

To navigate to a specific *bookmark*, do either of the following:

- Use any of the specific bookmark navigation shortcuts (**Ctrl+1** through **Ctrl+9**).
- Use one of the actions available on the **Edit > Bookmarks > Go to** menu.

> **Tip:**
> The navigation shortcuts work even if the document where the bookmark was inserted has been closed. In this case, using the shortcut will automatically re-open the document.

Displaying the Markup

You can control the amount of markup that is displayed in the **Author** mode with various levels of tag modes for both *block* and *in-line* elements.

Tags Display Mode

The following dedicated tag modes are available from the **Tags Display Mode** drop-down menu (available on the toolbar):

Full Tags with Attributes

Displays full tag names with attributes for both *block (on page 3417)* and *inline elements (on page 3420)*.Oxygen XML Editor

Full Tags

Displays full tag names without attributes for both *block elements* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Block Tags without Element Names

Displays tags for *block elements* but without element names for a more compact version of **Block Tags** mode. You can still see the element names by hovering over the tags.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page where you can configure the **Tags Display Mode** options.

Note:
The associated CSS information is used to determine whether a tag should be considered *inline* or *block*. If the current document does not have an associated CSS stylesheet, then the **Full Tags** mode will be used.

Displaying Referenced Content

The references to external entities, XInclude, DITA conrefs, and constructs in other vocabularies with displayable referenced content *(on page 2360)* are expanded by default in **Author** mode and the referenced content is displayed. The referenced resources are loaded and displayed inside the element or entity that references them, but the displayed content cannot be modified directly in the document. You can control this behavior from the **Author** preferences page *(on page 183)*. If the **Display referenced content** option *(on page 186)* is not selected, the referenced resources are not automatically loaded and displayed, but each reference can be expanded on demand by using the small expansion button located next to each element that contains references.

Figure 141. XInclude reference

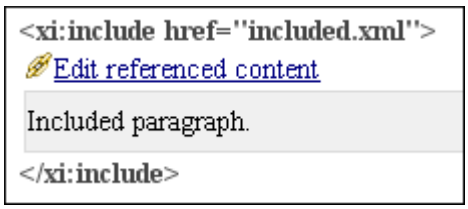


Figure 142. External entity reference

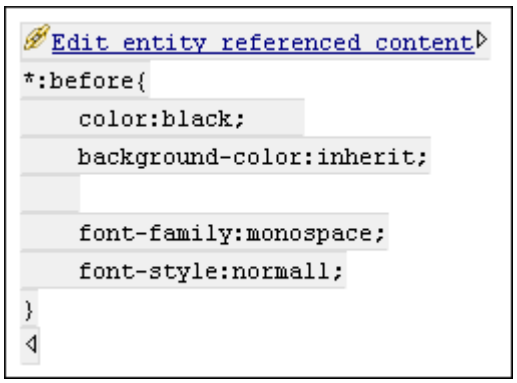


If the referenced resource cannot be resolved, an error will be presented inside the element that refers them instead of the content.

If you want to make modifications to the referenced content, you must open the source where the referenced resource resides. The referenced resource can be opened quickly by clicking the link (marked with the icon, or the icon for key-based references) that is displayed before the referenced content or by using the **Edit Reference** action from the contextual menu (in this case, the cursor is placed at the precise location where the action was invoked). The referenced resource is resolved through the *XML Catalog (on page 3425)* set in the **XML Catalog** preferences page *(on page 243)*.

The referenced content is refreshed as follows:

- Automatically, when it is modified and saved from Oxygen XML Editor.
- On demand, by using the **Refresh references** action *(on page 766)*. This is useful when the referenced content is modified outside the Oxygen XML Editor scope.

Related Information:

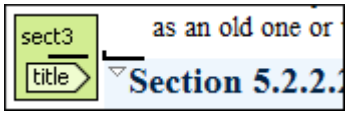
Configuring a Reference Resolver *(on page 2360)*

Visual Hints for the Cursor Position

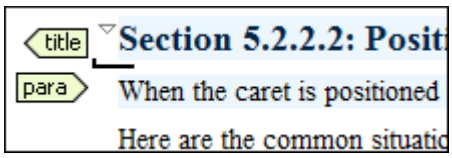
When the cursor is positioned inside a new context, a tooltip will be shown for a couple of seconds displaying the position of the cursor relative to the context of the current element.

Here are some of the common situations that can be encountered:

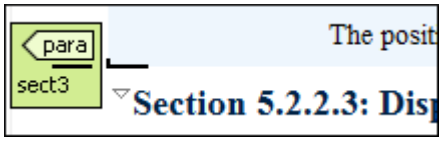
- **Before first *block*** - The cursor is positioned before the first *block (on page 3417)* child of the current node.



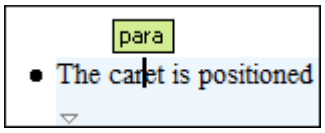
- **Between two *block elements*** - The cursor is positioned between two *block elements (on page 3417)*.



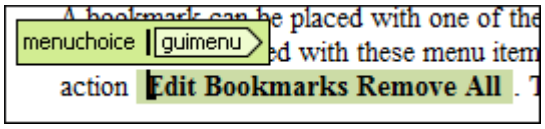
- **After last *block*** - The cursor is positioned after the last *block element (on page 3417)* child of the current node.



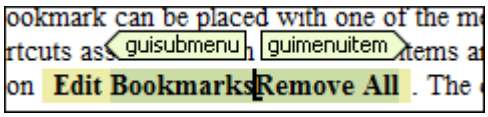
- **Inside a node** - The cursor is positioned inside a node.



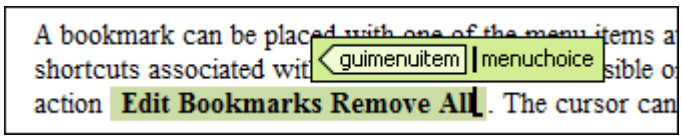
- **Before an *inline element*** - The cursor is positioned inside an element, before a child *inline element (on page 3420)*.



- **Between two inline elements** - The cursor is positioned between two *inline elements (on page 3420)*.



- **After an inline element** - The cursor is positioned inside an element, after a child *inline element (on page 3420)*.



The nodes in these cases are displayed in the tooltip window using the element names.

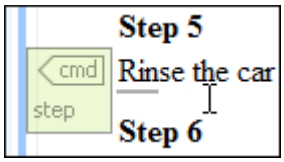
To deactivate this feature, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Author > Cursor Navigation**, and deselect the **Show cursor position tooltip** option *(on page 187)*. Even if this option is deselected, you can still display the position tooltip by pressing **Shift+F2**.

Note:
The position information tooltip is not displayed if **Full Tags with Attributes** or **Full Tags** is selected in the **Tags display mode** drop-down menu *(on page 604)*.

Location Tooltip

When editing XML documents in a visual environment, you might find it difficult to position the cursor between certain tags that do not have a visual representation. To counterbalance this, Oxygen XML Editor displays a transparent preview of the position information, called the **Location Tooltip**:

Figure 143. Location Tooltip



Oxygen XML Editor displays a **Location Tooltip** when the following conditions are met:

- You are editing the document in one of the following tags display modes *(on page 604)*: **Inline Tags**, **Partial Tags**, **No Tags**.
- The mouse pointer is moved between *block elements (on page 3417)*.

To activate or deactivate this feature, use the **Show location tooltip on mouse move** option *(on page 187)* in the **Cursor Navigation** preferences page *(on page 187)*.

Whitespace Handling in Author Mode

When you edit a document in **Author** mode, Oxygen XML Editor must serialize the resulting document as XML. Oxygen XML Editor serializes the document when you save it or switch to another editing mode. When the document is serialized, Oxygen XML Editor formats and indents the XML document *(on page 565)* according to the current format and indent settings *(on page 210)*.

Minimizing Whitespace Differences Between Versions

When serializing a document to XML, **Author** mode will only format and indent those elements of the document that have been edited. Any element that has not been edited will be serialized exactly as it was loaded from disk. This is useful when your content is managed in a version control systems, as it avoids introducing insignificant whitespace differences between version, which in turn makes diff output easier to read.

Entering Whitespace in Author Mode

Oxygen XML Editor controls the entry of whitespace characters in **Author** mode according the XML whitespace rules *(on page 565)*, which means it will not let you insert insignificant whitespace. This means that it will not let you insert extra line-breaks or spaces inside a typical paragraph element, for instance. (Any such whitespace would be normalized away when the document was serialized to XML, so Oxygen XML Editor is saving you from any surprises when this happens.)

Of course, you will legitimately want to enter additional spaces and returns in some cases, such as code samples. Oxygen XML Editor will allow this in elements that are configured as preserve space elements according to the XML whitespace rules. For all of its built-in document types *(on page 1327)*, Oxygen XML Editor is correctly configured to recognize preserve space elements *(on page 213)* and to allow you to enter additional spaces in them.

If you are using a built-in document type and you are unable to enter additional whitespace, make sure that you are using an element from that document type that is intended to be a preserve-space element.

If you are using a custom document type, make sure that it is configured correctly *(on page 2248)* so that Oxygen XML Editor recognizes that the current element is a preserve-space element.

Serialization Options for Author Mode

The **Options > Preferences > Editor > Edit modes > Author > Serialization** page contains some options that control how the formatting and indenting is applied when a document is saved in **Author** mode or when switching from **Author** to **Text** mode. It also includes a **Compatibility with other tools** option *(on page 205)* that controls how line breaks are handled when a document is serialized to help obtain better compatibility with other applications.

Editing Content in Author Mode

The **Author** mode includes a large variety of user-friendly authoring features to help you work with XML content, including numerous toolbar, menu, and shortcut actions and some specialized content editing features.

Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

Undo (Ctrl + Z (Command + Z on macOS))

Reverses a maximum of 200 editing actions (configurable with the **Undo history size** option *(on page 177)* in the **Editor** preferences page) to return to the preceding state.

Note:
Complex operations such as **Replace All** or **Indent selection** count as single undo events.

Redo (Ctrl + Y (Command + Shift + Z on macOS, Ctrl + Shift + Z on Linux/Unix))

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

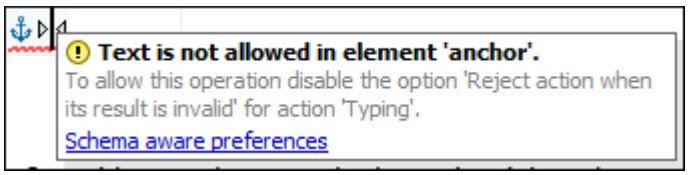
Select All (Ctrl + A (Command + A on macOS))

Selects the entire content of the current document.

Entering Text in Elements

By default, you can only enter text in elements that accept text content. If the element is declared as *empty* or *element only* in the associated schema, you are not allowed to insert text in it. Instead, a warning message is displayed.

Figure 144. Editing in empty element warning



To allow text to be inserted in these instances, go to the **Schema-Aware** preferences page and deselect the **Reject action when its result is invalid** option in the **Typing** actions section *(on page 189)*.

Editing Text Content Without Modifying the XML Markup

You can use the options in the **Tags Display Mode** drop-down menu *(on page 604)* (available on the toolbar) to control how tags are displayed in **Author** mode. This can help you to clearly see where the current cursor position is within the tag structure so that you can avoid making unintended modifications to the XML markup. You can also switch to the **Grid** editing mode *(on page 589)* to modify text content without affecting the XML tags.

Changing the Font Size (Zoom)

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on macOS) or Ctrl + MouseWheelForward (Windows/Linux)

Increases the font size (zooms in) with one point for each execution of the action.

> **Note:**
> For macOS, if you activate the **Enable mouse-wheel zooming** option *(on page 178)* in the **Editor** preferences page, you can use **Command + MouseWheelForward** to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on macOS.

Decrease editor font (Ctrl + NumPad- (Command + NumPad- on macOS) or Ctrl + MouseWheelBackwards (Windows/Linux)

Decreases the font size (zooms out) with one point for each execution of the action.

> **Note:**
> For macOS, if you activate the **Enable mouse-wheel zooming** option *(on page 178)* in the **Editor** preferences page, you can use **Command + MouseWheelBackwards** to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on macOS.

Normal editor font (Ctrl + 0 (Command + 0 on macOS))

Resets the font size to the value of the editor font set in the **Fonts** preferences page *(on page 140)*.

Editing XML Markup in Author Mode *(on page 611)*
Drag and Drop in Author Mode *(on page 622)*
Smart Paste in Author Mode *(on page 623)*
Content Completion Assistant in Author Mode *(on page 626)*
Contextual Menu Actions in Author Mode *(on page 771)*
Frequently Used Shortcut Keys *(on page 55)*

Editing XML Markup in Author Mode

Oxygen XML Editor includes some useful actions that allow you to easily edit XML markup in **Author** mode. Most of these actions are available in the contextual menu and some of them have simple keyboard shortcuts.

Selecting XML Markup in Author Mode

Selecting XML tags in Oxygen XML Editor is very simple with several methods for selecting entire elements:

- **Breadcrumb** - Click the element (XML tag) on the breadcrumb *(on page 612)* displayed at the top of the editing window.
- **Outline View** - Click the element name in the **Outline** view *(on page 549)*.
- **Full Tags Mode** - While editing in **Full Tags** mode *(on page 604)*, click the start or end tag of the element in the editor.
- **Mouse Selection** - While editing in **Full Tags** mode *(on page 604)*, click before the start tag of the element, drag the selection, and release the mouse button after the end tag.
- **Shift + Arrow Keys** - While editing in **Full Tags** mode *(on page 604)*, place the cursor before the start tag of the element, press and hold **Shift**, and use the arrow keys to make the selection (including the end tag).

Note:
If the selection does not include the entire element (for example you do not include the end tag of the element), Oxygen XML Editor will automatically close the appropriate tags when pasting the copied selection. This ensures that the pasted content will always result in well-formed XML *(on page 784)*.

Using the Breadcrumb in Author Mode

A *breadcrumb* on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

Figure 145. Breadcrumb in Author Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the *breadcrumb* selects the entire element in the editor area and each element provides a contextual menu with access to the following actions:

Edit Attributes

Opens the in-place attributes editor *(on page 640)* that allows you to easily edit the attributes of an element.

Edit Profiling Attributes

Allows you to select the profiling attributes *(on page 680)* that apply to a certain element.

Append child

Opens a content completion list that allows you to select an element to be inserted as a child of the selected element.

Insert before

Opens a content completion list that allows you to select an element to be inserted (as a sibling) before the selected element.

Insert after

Opens a content completion list that allows you to select an element to be inserted (as a sibling) after the selected element.

Cut

Removes the selected element and copies it to the clipboard, while preserving the styles of the content.

Copy

Copies the selected element to the clipboard, while preserving the styles of the copied content.

Paste

Pastes a well-formed element from the clipboard at currently selected position in the breadcrumb.

Paste before

Insert a well-formed element (from the clipboard) before the currently selected element.

Paste after

Insert a well-formed element (from the clipboard) after the currently selected element.

Paste as XML

Inserts clipboard content that is considered to be well-formed XML content, preserving its XML structure.

Delete

Deletes the currently selected element.

Toggle Comment

Encloses the currently selected element in a comment if the element is not commented, or removes the comment if it is commented.

Rename Element

Opens the **Rename** dialog box that allows you to rename the currently selected element and other elements with the same name.

Tip:
The tag names displayed in the *breadcrumb* can be customized with an **Author** mode extension class that implements the *AuthorBreadCrumbCustomizer* API. See the Oxygen SDK for more details.

Move Nodes

You can move XML nodes in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

Tip:
The easiest way to move nodes is to use the **Alt + UpArrow (Option + UpArrow on macOS)** and **Alt + DownArrow (Option + DownArrow on macOS)** shortcut keys.

Promote/Demote Nodes

You can easily promote or demote selected nodes (for example, within ordered lists or unordered lists) by using the following keyboard shortcuts:

Promote (Shift + Tab)

Promotes an entirely selected node to be a sibling of its parent node (the list item is moved to the left). It also works for selections of multiple nodes as long as all the selected nodes are siblings (on the same hierarchical level).

Demote (Tab)

Demotes an entirely selected node (the list item is moved to the right). It also works for selections of multiple nodes as long as all the selected nodes are siblings (on the same hierarchical level).

Join or Split Elements

You can join or split elements in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Join Elements

Joins two adjacent *block elements (on page 3417)* that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

Tip:
Specifically, the **Delete** or **Backspace** keys can be used to join *block elements* in the following situations:

- The cursor is located before the end position of the first element and **Delete** key is pressed.
- The cursor is located after the end position of the first element and **Backspace** key is pressed.
- The cursor is located before the start position of the second element and **Delete** key is pressed.
- The cursor is located after the start position of the second element and **Backspace** key is pressed.

If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

Split Element (Alt + Shift + D (Ctrl + Option + D on macOS))

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Rename Elements

You can rename elements by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Surround Content with Tags (Wrap)

You can surround a selection of content with tags (*wrap* the content) by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Surround with Tags (Ctrl + E (Command + E on macOS))

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option *(on page 220)* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option *(on page 220)* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on macOS))

Surround the selected content with the last tag used.

Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

Tip:
Specifically, the **Delete** or **Backspace** keys can be used to unwrap the content of an element in the following situations:

- The cursor is located before the start position of the element and **Delete** key is pressed.
- The cursor is located after the start position of the element and **Backspace** key is pressed.
- The cursor is located before the end position of the element and **Delete** key is pressed.
- The cursor is located after the end position of the element and **Backspace** key is pressed.

If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

Remove Markup from Blocks of Content

You can remove the markup from the current element by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Tip:
You can use the **Delete** or **Backspace** keys to remove markup, in which case the elements in the selected block will be unwrapped or joined with their sibling, or if the current element is empty, the element tags will be deleted.

Remove Text from Selected Markup

You can remove the text from elements by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

DITA-related Refactoring Actions

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

Change Topic ID to File Name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS Tables to Simple Tables

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert conrefs to conkeyrefs

Use this operation to convert `@conref` attributes to `@conkeyref` attributes.

Convert Simple Tables to CALS Tables

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Copying XML Content in Author Mode to the Clipboard

It is possible to copy the XML structure of a document to the system clipboard. Simply select the XML content in **Author** mode (for example, by selecting an element in the breadcrumb), and select **Document > Edit > Copy as XML**. The system clipboard will now contain the corresponding XML structure.

Frequently Used Shortcut Keys *(on page 55)*

Editing Attributes in Author Mode

You can easily edit attributes in **Author** mode by using the **Attributes View** *(on page 638)* and Oxygen XML Editor also allows you to edit attribute and element values in-place, directly in the **Author** mode, using an in-place attribute editor.

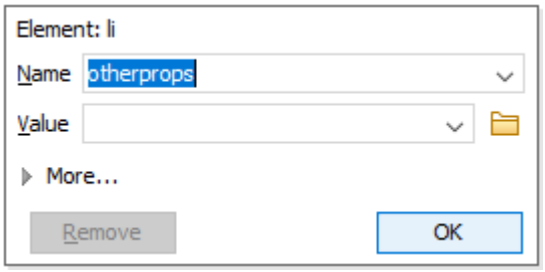
In-place Attributes Editor

Oxygen XML Editor includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following display modes: **Full Tags with Attributes**, **Full Tags**, **Block Tags**, or **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

Figure 146. In-place Attributes Editor



Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

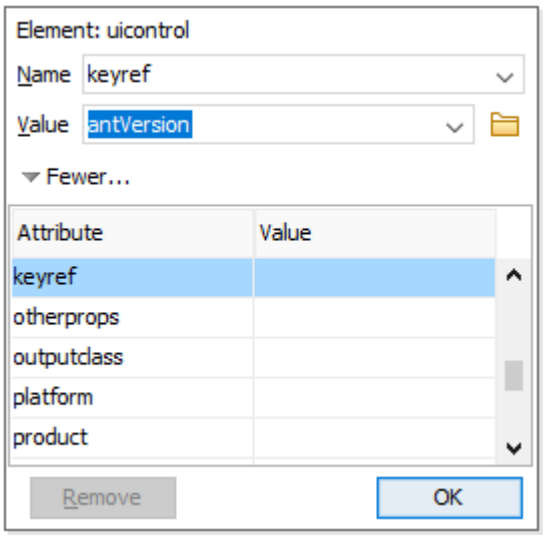
Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values.

Note:
For built-in frameworks, if the selected attribute in the **Name** field is an `@id` attribute, the **Browse** button is replaced by a **Generate Unique ID Value** button. Clicking this button will automatically generate a unique ID for the selected element.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

Figure 147. In-place Attributes Editor (Full Version)



The full version includes a table grid, similar to the **Atributes** view, that presents all the attributes for the selected element.

Note:
If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

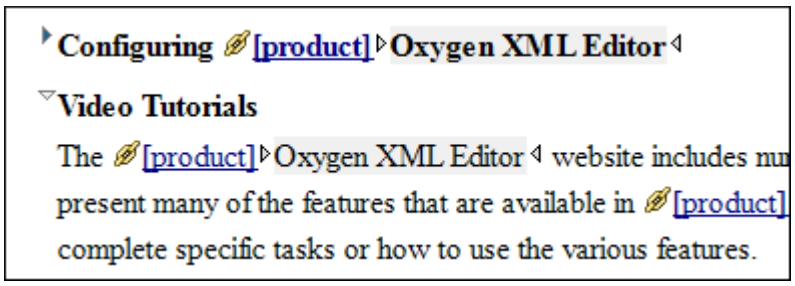
Attributes View in Author Mode *(on page 638)*

Folding XML Elements in Author Mode

When working with a large document, the *folding (on page 3420)* support in Oxygen XML Editor can be used to collapse some element content leaving only the parts that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

Figure 148. Folding of XML Elements in Author Mode



The fact that the folds are persistent is a unique feature of Oxygen XML Editor, meaning the next time you open the document the folds are restored to its last state.

Folding Actions in Author Mode

Foldable elements (on page 3420) are marked with a small triangle (/) on the left side of the editor panel. If you hover over that arrow, the entire content of the element is highlighted by a dotted border for quick identification of the *foldable* area. To toggle the fold, simply click the icon. Also, the following actions are available in the **Folding** sub-menu of the contextual menu or from the **Document > Folding** menu:

Toggle Fold (or you can simply click on the / arrow)

Toggles the state of the current fold.

Collapse Other Folds

Folds all the elements except the current element.

Collapse Child Folds

Folds the child elements that are indented one level inside the current element.

Expand Child Folds

Unfolds all child elements of the currently selected element.

Expand All

Unfolds all elements in the current document.

Resources

https://www.youtube.com/embed/eR9HfN_peAE

Related Information:
Folding Elements: -oxy-foldable / -oxy-folded / -oxy-not-foldable-child *(on page 2467)*

Drag and Drop in Author Mode

The Oxygen XML Editor **Author** mode includes support for dragging and dropping content in XML documents.

When editing content in **Author** mode, entire sections or chunks of data can be moved or copied by using the drag and drop feature. The following situations can be encountered:

- When both of the drag and drop sources are from the **Author** mode editor, a well-formed XML fragment is transferred. The section is balanced before dropping it by adding matching tags when needed.
- When the drag source is from the **Author** mode editor but the drop target is a text-based editor, only the text inside the selection is transferred as it is.
- The text dropped from another text editor or another application into the **Author** mode editor is inserted without changes.

Related Information:
Smart Paste in Author Mode *(on page 623)*

Smart Paste in Author Mode

The **Author** editing mode includes a *Smart Paste* feature that preserves certain style and structure information when copying content and pasting it into document types that support the feature. You can copy content from various sources, including web pages, external applications (such as Office-type applications), Markdown documents, or other types of documents and then paste it into DITA, TEI, DocBook, JATS, and XHTML documents. Oxygen XML Editor preserves the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs) and considers various pasting solutions to keep the resulting document valid.

The styles and general layout of the pasted content are converted to the equivalent XML markup for the target document type while preserving certain style and structure information. For example, if you copy content that includes multiple paragraphs and then paste it in **Author** mode, the multiple paragraph structure is preserved. If you paste the content in a location where the resulting XML would not be valid, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

Notes:

- When pasting text fragments formatted with the *Courier New* font, the *Smart Paste* mechanism will wrap it in an inline code element (for example, in DITA it would be wrapped in a `<codeph>` element).
- Review comments that exist in the copied Word content are intentionally ignored when pasting the content in **Author** mode.

Smart Paste Options

By default, the *Smart Paste* feature is enabled in Oxygen XML Editor. There are several options in the **Schema Aware** preferences page *(on page 188)* that control the *Smart Paste* mechanism:

- **Smart paste and drag and drop** *(on page 189)* - This option determines whether or not Oxygen XML Editor will try to find an appropriate insert position when the current location is not valid for the pasted content. This option is selected by default.
- **Reject action when its result is invalid** *(on page 189)* - If you select this option, Oxygen XML Editor will not let you paste content into a position where it would be invalid. This option is deselected by default.

- **Convert external content on paste** *(on page 190)* - This option determines whether or not Oxygen XML Editor will convert the styling and formatting of copied content from external sources when pasting it into a document type that supports the feature. This option is selected by default.
- **Convert even when pasting inside space-preserve elements** *(on page 190)* - If you select this option, the *Smart Paste* feature will also work when pasting external content into a *space-preserve* element (such as a `<codeblock>`). This option is deselected by default.

Smart Paste Supported Document Types

The *Smart Paste* feature is supported for the following document types (*frameworks (on page 3420)*):

- DITA
- DocBook 4
- DocBook 5
- TEI
- XHTML
- JATS

Resources

Selecting Content in Author Mode

Oxygen XML Editor includes a variety of features and keyboard shortcuts to help you select content in **Author** mode.

Selection Shortcuts in Author Mode

Ctrl + A (Meta + A on macOS)

Selects all content in the document.

Shift + Left/Right Arrow Keys

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

Shift + Up/Down Arrow Keys

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on macOS)

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

Shift + Home

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on macOS, it extends to the beginning of the document).

Shift + End

Begins a continuous selection at the cursor position and extends it to the end of the current line (on macOS, it extends to the end of the document).

Ctrl + Shift + Home

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

Ctrl + Shift + End

Begins a continuous selection at the cursor position and extends it to the end of the document.

Shift + PageUp

Begins a continuous selection at the cursor position and extends it up one screen page.

Shift + PageDown

Begins a continuous selection at the cursor position and extends it down one screen page.

Double-Click

Selects the word at the cursor position.

Triple-Click

Selects the node at the cursor position.

Right-Click > Select > Element

Selects the entire element at the current cursor position.

Right-Click > Select > Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Right-Click > Select > Parent

Selects the entire parent element at the current cursor position.

Intelligent Selection in Author Mode

Oxygen XML Editor supports all usual content selection methods using the mouse or keyboard shortcuts (for example **Shift + Arrow Keys**). When selecting content in **Author** mode, there may be instances where you want

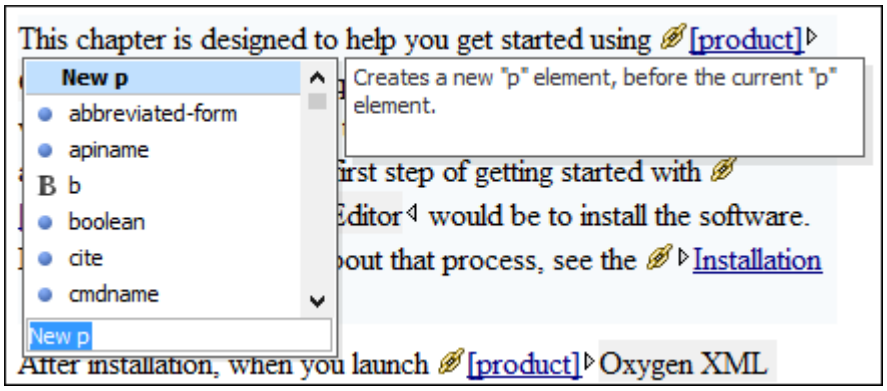
to select an element (along with its content) rather than just inline text content. There are several ways to select an element, including:

- You can select an element by clicking the element name in the *breadcrumb (on page 603)*.
- You can select an element using the **Outline** view *(on page 549)*.
- If you have the **Tags Display Mode** *(on page 604)* set to any of the modes other than **Partial Tags** or **No Tags**, you can select an element directly in the main editing pane by clicking on the element's tag.
- If you have the **Tags Display Mode** *(on page 604)* set to **Partial Tags** (and the **Compact tag layout** option is enabled in the **Author** preferences page *(on page 186)*), you can still select certain block elements directly in the main editing pane by spanning the selection to the right of the end of the content that is inside a block element so that the selection includes the element's *invisible* end tag. In this mode, the end tag is normally not visible, but when your selection includes the invisible end tag, a tooltip displays the selected element name and the selection includes the whole element (along with its content).

Content Completion Assistant in Author Mode

One of the most useful features in **Author** mode is the *Content Completion Assistant (on page 3418)*. It offers a list of elements, attributes, attribute values, and other options that are valid in the current editing context.

Figure 149. Content Completion Assistant in Author Mode



The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Editor > Content Completion**, and deselect the **Enable content completion** option *(on page 219)*.

Using the Content Completion Assistant in Author Mode

To activate the feature in **Author** mode, use any of the following shortcut keys:

- **Enter**
- **Ctrl + Space**
- **Alt + ForwardSlash (Command + Option + ForwardSlash on macOS)**

You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. In same cases, the *Content Completion Assistant* displays a documentation window with information about the particular proposal and some of them have links to additional information (for example, DITA elements might have a link to the DITA Style Guide). You can use **Tab** and **Shift + Tab** to navigate to those links and **Space** to trigger them. You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Author** mode, simply press **Enter**.

Types of Proposals Listed in the Content Completion Assistant

The *Content Completion Assistant* offers the following types of proposed actions depending on the current context:

- Insert allowed elements for the current context schema and the list of proposals contains elements depending on the elements inserted both before and after the cursor position.
- Insert element values if such values are specified in the schema for the current context.
- Insert new undeclared elements by entering their name in the text field.
- Insert CDATA sections, comments, processing instructions.
- Insert code templates *(on page 546)*.
- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in **Full Tags** mode *(on page 604)*), it will allow you to rename the element.
- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.
- If invoked on an empty list item that is the last element of the list, it will allow you to convert the list item to a paragraph.
- If the **Show all possible elements in the content completion list** option from the **Schema-Aware** preferences page *(on page 190)* is selected, the content completion pop-up window will present all the elements defined by the schema. When choosing an element from this section, the insertion will be performed using the schema-aware smart editing features.

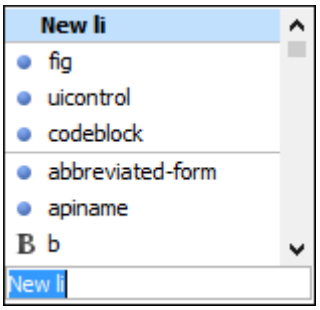
> **Note:**
> By default, you are not allowed to insert element names that are not defined by the schema. This can be changed by deselecting the **Allow only insertion of valid elements and attributes** check box from the **Schema-Aware** preferences page *(on page 190)*.

Examples of How the Content Completion Assistant Works

To illustrate how the feature works, consider the following examples of invoking the *Content Completion Assistant* in certain contexts:

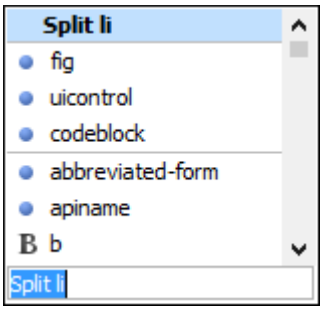
- If the cursor is positioned at the beginning or at the end of the element, the first item offered in the *Content Completion Assistant* is a **New <Element>** item. Selecting this item will insert an empty element.

Figure 150. Example (New [Element Name])



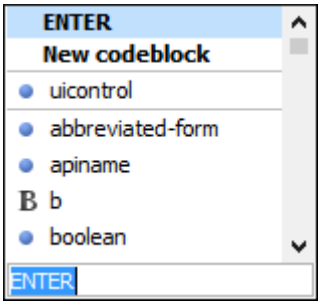
- If the cursor is positioned somewhere inside the element, the first entry in the *Content Completion Assistant* is a **Split <Element>** item. In most cases, you can only split the closest *block element (on page 3417)* to the cursor position, but if it is inside a list item, the list item will also be proposed for split. Selecting **Split <Element>** splits the content of the specified element around the cursor position.

Figure 151. Example (Split [Element Name])



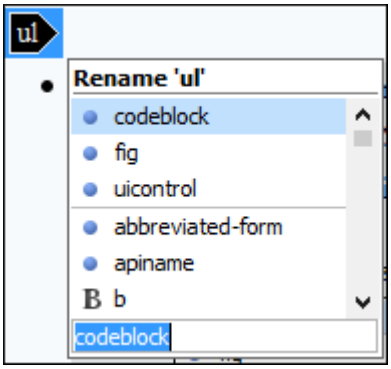
- If the cursor is positioned inside a *space-preserved element (on page 3424)* (for example, a *codeblock*), the first choice in the *Content Completion Assistant* is **Enter**, which will insert a new line in the content of the element, followed by **New <Element>**.

Figure 152. Example ('ENTER' New Line)



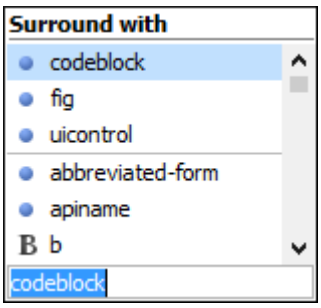
- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in **Full Tags** mode *(on page 604)*), it will allow you to rename the element.

Figure 153. Example (Rename)



- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.

Figure 154. Example (Surround)



Related Information:

Customizing the Content Completion Assistant Using a Configuration File *(on page 2309)*

Set the Schema to be Used for Content Completion

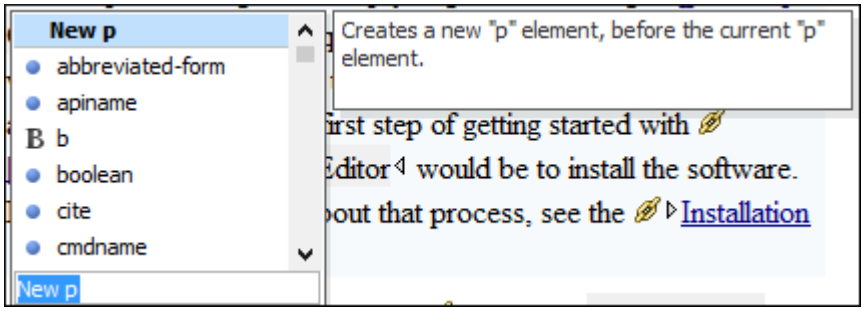
The proposals that are presented in the *Content Completion Assistant (on page 3418)* depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the *Content Completion Assistant* is specified in the following methods, in the order of their precedence:

- The schema specified explicitly in the document *(on page 835)*. In this case, Oxygen XML Editor reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
- The default schema declared *(on page 837)* in the **Schema** tab of the **Document Type** configuration dialog box *(on page 151)* for the particular document type.

Schema Annotations in Author Mode

A *schema annotation* is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in the *Content Completion Assistant (on page 3418)*.

Figure 155. Schema Annotation in the Content Completion Assistant



The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the **Show annotations in Content Completion Assistant** *(on page 224)* option in the **Annotations** preferences page.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `<div>`, `<body>`, `<p>`, `<br>`, `<table>`, `<ul>`, or `<ol>`).

The HTML rendering is controlled by the **Show annotations using HTML format, if possible** *(on page 225)* option in the **Annotations** preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`<p>`, `<br>`, `<ul>`, `<li>`), they are rendered as an HTML document loaded in a web browser. For example, `<p>` begins a new paragraph, `<br>` breaks the current line, `<ul>` encloses a list of items, and `<li>` encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```
<xs:annotation>
  <xs:documentation>
            Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the `http://relaxng.org/ns/compatibility/annotations/1.0` namespace like this:

```
<define name="person" >
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
            Information about a person. </a:documentation>
      <ref name="name"/>
        <zeroOrMore>
      <ref name="email"/>
        </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (`http://relaxng.org/ns/structure/1.0`) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the **Use all Relax NG annotations as documentation** *(on page 225)* option in the **Annotations** preferences page.

Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```
##  Information about a person.
element person { name, email*}
```

Collecting Annotation from DTDs

For DTD, Oxygen XML Editor defines a custom mechanism for annotations using comments enabled by the **Prefer DTD comments that start with "doc:" as annotations** *(on page 224)* option in the **Annotations** preferences page. The following is an example of a DTD annotation:

```
<!--doc:Description of the element. -->
```

Related Information:

Customizing the Rendering of Elements *(on page 2325)*

Customizing Annotations in the Content Completion Assistant *(on page 2330)*

Content Completion Helper Views (Author Mode)

Information about the current element being edited is also available in various *dockable (on page 3418)* views, such as the **Model** view *(on page 555)*, **Attributes** view *(on page 638)*, **Elements** view *(on page 643)*, and **Entities** view *(on page 557)*. By default, they are located on the right-hand side of the main editor window. These views, along with the powerful **Outline** view *(on page 549)*, provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Editor includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, JSON, HTML, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a symbol in the content completion list (**Enter** in **Author** mode or **Ctrl + Space** in **Text** mode). Also, in **Text** mode you can press **Ctrl + Shift + Space** to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content completion list or type its code and press **Enter**. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

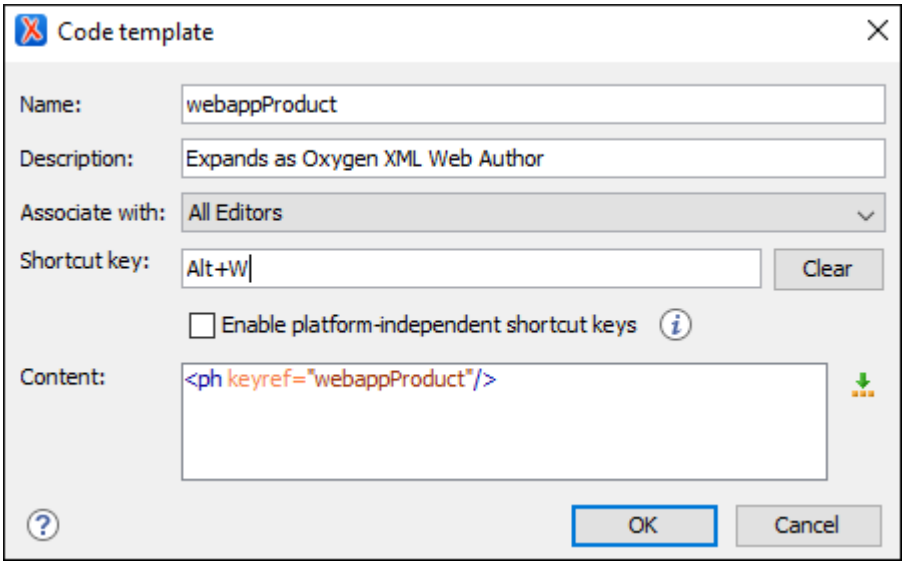
How to Create Code Templates

To create a code template, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Content Completion > Code Templates**.
2. Click **New** to open a code template configuration dialog box.

   Tip:
   You can use one of the existing code templates as a starting point by selecting that template and clicking **Duplicate**.

   Figure 156. Code Template Configuration Dialog Box

3. Configure your template using the fields in the code template configuration dialog box:

- **Name** - The name of the code template.
- **Description** - [Optional] The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the *Content Completion Assistant (on page 3418)*. HTML markup can be used for better rendering.
- **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
- **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the **Clear** button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
  - **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
  - **M2** represents the **Shift** key.
  - **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
  - **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable *(on page 332)* can be inserted in the text box using the **Insert Editor Variables** button.

4. Click **OK** to save your new code template.

Result: Your code template can now be selected using the *Content Completion Assistant (on page 3418)* (**Enter** in **Author** mode or **Ctrl + Space** in **Text** mode). The code templates are displayed with a symbol.

How to Share Code Templates

There are two ways to easily share all of your code templates with other members of your team:

Method 1: Export/Import

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Templates > Code Templates**.
2. Click the **Export** button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.
5. Instruct them to open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Editor > Templates > Code Templates**, click the **Import** button, and select the file you sent them.

   Result: The code templates will be now available in their content completion list.

Method 2: Share Project

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Templates > Code Templates**.
2. Select **Project Options** at the bottom of the dialog box. This stores the preferences in the project file (`.xpr`).
3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

   Result: When they open the updated project file in their **Project** view *(on page 413)*, the code templates will be available in their content completion list.

Tip:
It is also possible to configure certain actions that function similar to code templates and add them to the content completion list *(on page 2309)* for a particular framework. You could then share the whole framework *(on page 2406)* with other members of your team.

Author Mode Views

The content author is supported by a variety of *dockable (on page 3418)* helper views that are displayed by default when editing in **Author** mode. These views are automatically synchronized with the current editing context of the editor panel. They present additional information about this context thus helping the author to see quickly the current location in the overall document structure and the available editing options.

There is also a large selection of additional useful views available in the **Window > Show View** menu. This section presents some of the most helpful views for editing in **Author** mode.

Outline View for XML Documents

The **Outline** view displays a general tag overview of the currently edited XML document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*` or `?`) and separate multiple patterns with commas.

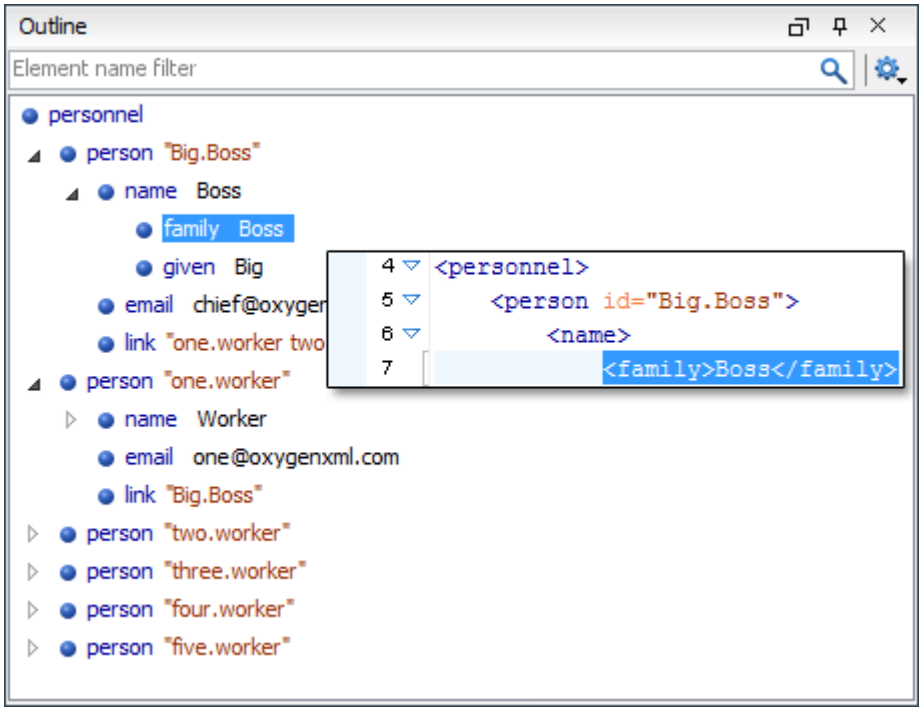
It also includes a **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

Drag and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **Ctrl (Command on macOS)** key after dragging, a copy operation will be performed instead of a move.

Figure 157. Outline View



Outline View Filters

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*` or `?`) and separate multiple patterns with commas.

The following actions are available in the **Settings** menu of the **Outline** view:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move (Available in Text mode)

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel *(on page 315)*.

Configure displayed attributes

Displays the **XML Structured Outline** preferences page *(on page 315)*.

Outline View Contextual Menu Actions

The contextual menu of the **Outline** view contains the following actions:

Edit Attributes

Displays an in-place attributes editor that allows you to edit the attributes of a selected node.

Edit Profiling Attributes (Available in Author mode)

Allows you to change the profiling attributes *(on page 680)* defined on all selected elements.

Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

Cut, Copy, Paste, Delete common editing actions

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content.

Paste before (Available in Author mode)

Inserts a well-formed copied element before the currently selected element.

Paste after (Available in Author mode)

Inserts a well-formed copied element after the currently selected element.

Paste as XML (Available in Author mode)

Pastes copied content that is considered to be valid XML, preserving its XML structure.

Toggle Comment

Encloses the currently selected element in a comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Rename Element (Available in Author mode)

Invokes a **Rename** dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

Expand More

Expands the structure tree of the currently selected element.

Collapse All

Collapses all of the structure tree of the currently selected node.

Tip:
You can copy, cut or delete multiple nodes in the **Outline** by using the contextual menu after selecting multiple nodes in the tree.

Attributes View in Author Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a **false** value for the -oxy-editable *(on page 2465)* property associated with the element.
- The element is entirely included in a deleted *Track Changes (on page 653)* marker.
- The element is part of a content fragment that is referenced in **Author** mode from another document.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

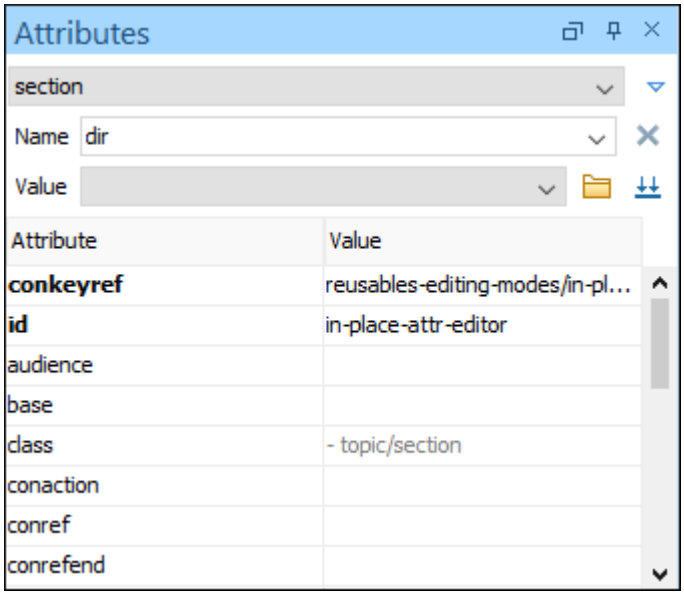
To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

Note:
If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Figure 158. Attributes View



A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

Expand/Collapse Button

There is an **Expand/Collapse** (/) button at the top-right of the view. When expanded, this presents the following additional combo boxes:

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the **Remove** button to delete an attribute and its value from the selected element.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values. After you have entered or selected a value, use the **Update** button (or press **Enter**) to add the value to the attribute.

> **Note:**
> For built-in frameworks, if the selected attribute in the **Name** field is an `@id` attribute, the **Browse** button is replaced by a **Generate Unique ID Value** button. Clicking this button will automatically generate a unique ID for the selected element.

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Author** mode:

Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **Delete** or **Backspace** keys.

Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

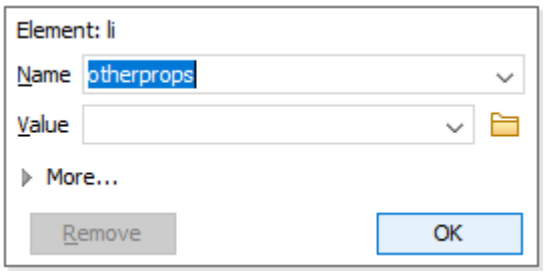
In-place Attributes Editor

Oxygen XML Editor includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following display modes: **Full Tags with Attributes**, **Full Tags**, **Block Tags**, or **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

Figure 159. In-place Attributes Editor



Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

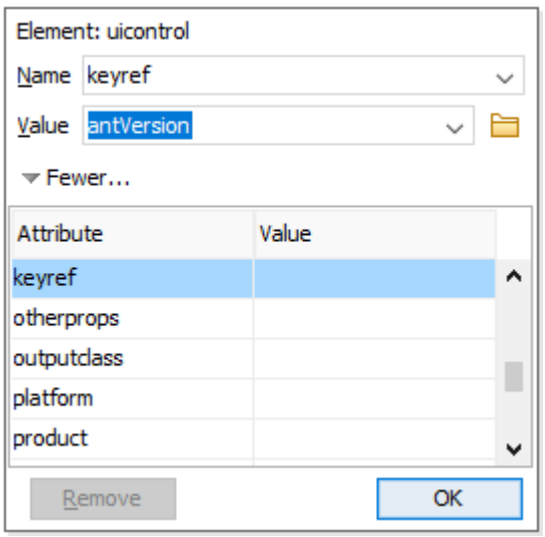
Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values.

Note:
For built-in frameworks, if the selected attribute in the **Name** field is an `@id` attribute, the **Browse** button is replaced by a **Generate Unique ID Value** button. Clicking this button will automatically generate a unique ID for the selected element.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

Figure 160. In-place Attributes Editor (Full Version)

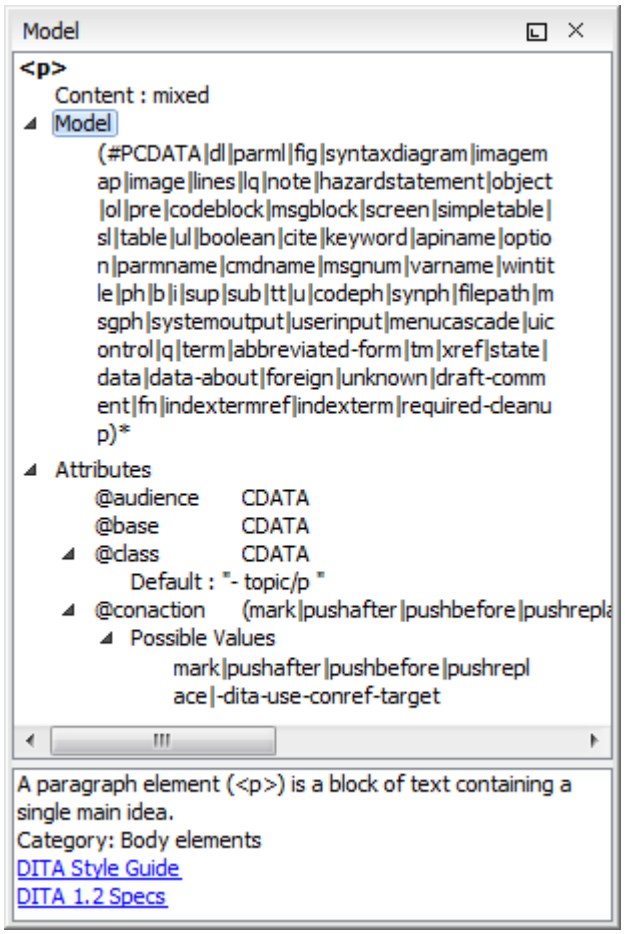


The full version includes a table grid, similar to the **Atributes** view, that presents all the attributes for the selected element.

Model View

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 161. Model View

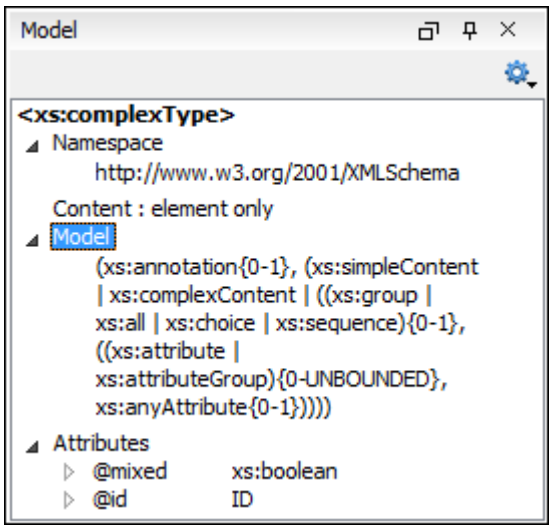


The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

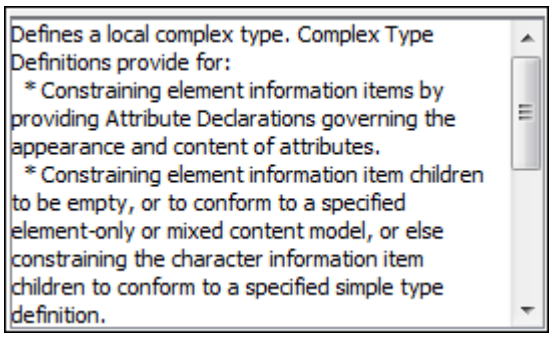
Figure 162. Element Structure Panel



Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 163. Annotation panel



Elements View in Author Mode

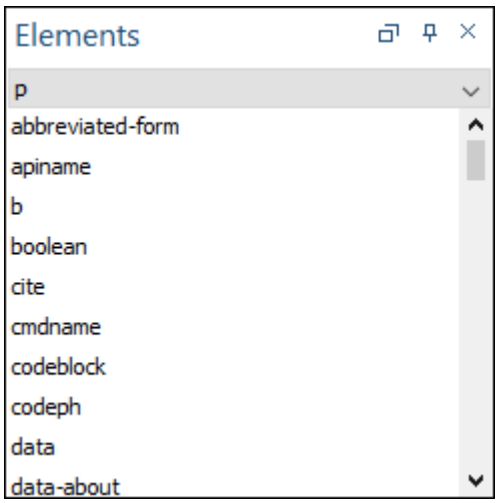
The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the **Show only allowed items** option *(on page 315)* is not selected in the **Views** preferences page *(on page 315)*, all elements allowed by the schema will be listed.

Double-clicking any of the listed elements inserts that element into the edited document at the current cursor position.

Pressing **F2** with an element selected will display information about that particular element.

Figure 164. Elements View in Author Mode



Entities View

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the `ENTITY` statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

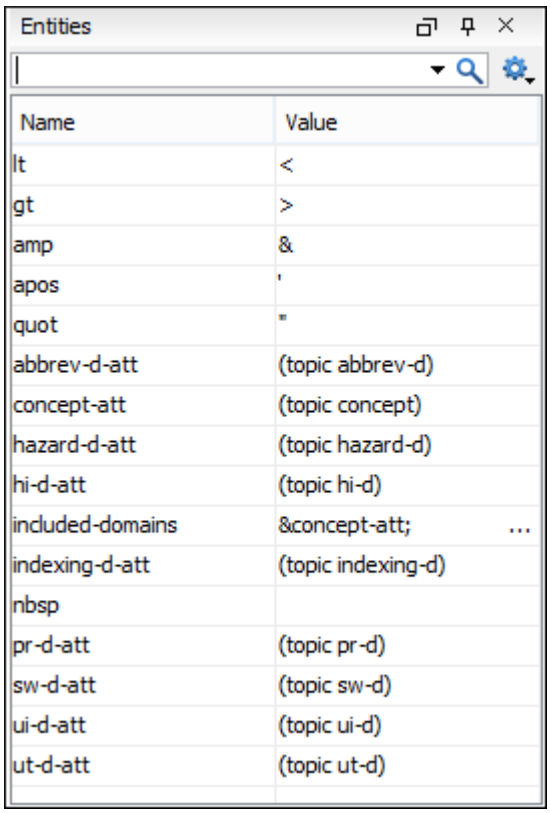
- **Predefined** - Entities that are part of the predefined XML markup (`<`, `>`, `&`, `&apos;`, `&quot;`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

Note:
If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Figure 165. Entities View



The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

Note:
When entering filters, you can use the *?* and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Results View

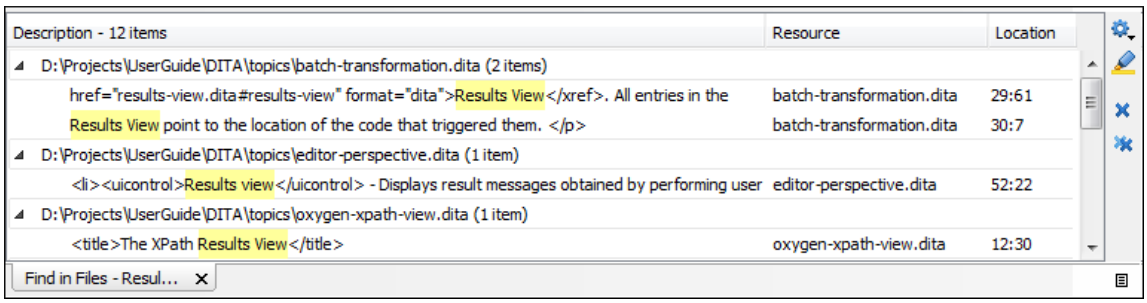
The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages. By default, the view normally opens at the bottom of the editor, but it is *dockable (on page 3418)*, so it can be moved to another UI location alongside other side views.

Tip:
To shift focus to the open **Results** view without using the mouse, there is an action in the **Window > Results** menu called **Focus Results** that can be used for this purpose and you can assign a keyboard shortcut *(on page 303)* to this action.

The actions that contribute messages to this view include:

- **Validation** actions *(on page 786)*
- **Transformation** actions *(on page 1470)*
- **Check Spelling in Files** action *(on page 468)*
- **Find All** action from the **Find/Replace** dialog box *(on page 442)*
- **Find/Replace in Files** dialog box *(on page 446)*
- **Search References** action *(on page 924)*
- XPath expression results *(on page 2118)*
- SQL results *(on page 2184)*

Figure 166. Results View



Results View Toolbar Actions

The view includes a toolbar with the following actions:

Settings drop-down menu

This drop-down menu also includes the following options:

Group by "Severity"

Groups the results based upon the severity of the validation issues.

Group by "Resource"

Groups the results based upon the type of resource.

Group by "System ID"

Groups the results based upon the system ID of the resource.

Group by "Operation description"

Groups the results based upon the description of the validation issue.

Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

Restore default grouping

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the **Check Spelling in Files** action *(on page 468)*.
- No grouping rule for the results of applying an XPath expression *(on page 2117)*.

Include problem ID in description

If this option is selected, validation issues will include the problem ID (as provided by the validation engine) in the **Description** column.

Show Ignored Problems

If you have ignored validation problems *(on page 823)*, you can deselect this option to hide the ignored problems. Likewise, you can select this option to show the ignored problems.

Highlight all results in editor

Oxygen XML Editor highlights all matches obtained after executing an XPath expression, or performing one of the following operations: **Find All**, **Find in Files**, **Search References**, and **Search Declarations**. Click **Highlight all results in editor** again to turn off highlighting.

Note:
To customize highlighting behavior, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Highlights category**. You can do the following customizations:

- Set a specific color of the highlights depending on the type of action you make.
- Set a maximum number of highlights that the application displays at any given time.

Remove selected

Removes the current selection from the view. This can be helpful if you want to reduce the number of messages, or remove those that have already been addressed or not relevant to your task.

Remove all

Removes all messages from the view.

Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

Learn Word(s) (Available when spelling errors are reported in the Results view)

Adds the word(s) to a list of learned words to instruct the spell checker engine to not report the word(s) as spelling errors in the future.

Show message

Displays a dialog box with the full error message, which is useful for a long message that does not have enough room to be displayed completely in the view.

 **Previous message**

Navigates to the message above the current selection.

 **Next message**

Navigates to the message below the current selection.

 **Remove selected**

Removes selected messages from the view.

 **Remove all**

Removes all messages from the view.

 **Copy**

Copies information associated with the selected messages. For example:

- The file path of the document that triggered the output message.
- The path of the *main file (on page 3421)* (in the case of a validation scenario *(on page 798)*, it is the path of the file where the validation starts and can be different from the validated file).
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- Name of validation scenario *(on page 798)*.
- The line and column in the file that triggered the message.

Copy Description

Copies the description values for all selected items. It is possible to assign a shortcut key *(on page 305)* for this action.

Select All

Extends the selection to all the messages from the view.

Print Results

Sends the complete list of messages to a printer. For each message, the included details are the same as the ones for the **Copy** action *(on page 648)*. This action is also available in the **Window > Results** menu.

Save Results

Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the **Copy** action *(on page 648)*. This action is also available in the **Window > Results** menu.

Save Results as XML

Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the **Copy** action *(on page 648)*.

Save Results as HTML

Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the **Copy** action *(on page 648)*.

Group by

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

 **Ungroup all**

Removes the grouping rules so that the messages are presented in a continuous list.

Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

Restore default grouping

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the **Check Spelling in Files** action *(on page 468)*.
- No grouping rule for the results of applying an XPath expression *(on page 2117)*.

 **Expand All**

Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

 **Collapse All**

Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Making a Persistent Copy of Results

The **Results** view *(on page 558)* displays the results from the following operations:

- Document validation *(on page 786)*
- Checking the form of documents *(on page 784)*
- XSLT or FO transformations *(on page 1470)*
- Finding all occurrences of a string in a file *(on page 442)*
- Finding all occurrences of a string in multiple files *(on page 446)*
- Applying an XPath expression to the current document *(on page 2120)*

To make a persistent copy of the **Results** view *(on page 558)*, use one of these actions:

File > Save Results

Displays the **Save Results** dialog box, used to save the result list of the current message tab. The action is also available on the right-click menu of the **Results** panel.

File > Print Results

Displays the **Page Setup** dialog box used to define the page size and orientation properties for printing the result list of the current **Results** panel. The action is also available on the right-click menu of the **Results** panel.

Save Results as XML from the contextual menu

Saves the content of the **Results** panel in an XML file with the format:

```
<Report>
    <Incident>
        <engine>The engine reporting the error.<engine>
        <severity>The severity level<severity>
        <Description>Description of output message.</Description>
        <SystemID>The location of the file linked to the message.</SystemID>
        <Location>
           <start>
                <line>Start line number in file.<line>
                <column>Start column number in file<column>
           </start>
           <end>
                <line>End line number in file.<line>
                <column>End column number in file<column>
           </start>
        </Location>
```

```
    </Incident>
</Report>
```

Related Information:

Results View *(on page 558)*

CSS Inspector View

The purpose of the **CSS Inspector** view is to display information about the styles applied to the currently selected element. You can use this view to examine the structure and layout of the CSS rules that match the element. The matching rules displayed in this view include a link to the line in the CSS file that defines the styles. With this tool you can see how the CSS rules were applied and the properties defined, and use the link to open the associated CSS for editing purposes.

Figure 167. CSS Inspector View

Displaying the CSS Inspector View

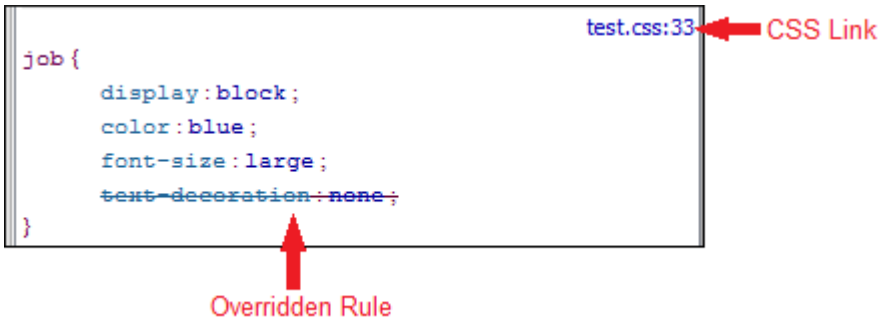
You can open this view by selecting the **Inspect Styles** action from the contextual menu in **Author** mode, or selecting the **CSS Inspector** view in the **Window > Show View** menu. This action makes the view visible and also initializes it for the currently selected element.

Displaying Rules

All rules that apply to the current element are displayed in sections, which are listed in order of importance (from most specific to least specific). Rules that are overridden by other rules are crossed out. If you click the

link in the top-right corner of a rule Oxygen XML Editor opens the associated CSS file at the line number where the properties of the rule are defined.

Figure 168. CSS Inspector View - Displaying Rules



The **CSS Inspector** view has six possible tabs (depending on the current context):

- **Element** - Displays the CSS rules matching the currently selected element in the **Author** page (ordered from most-specific to least-specific).
- **:marker** - Displays the rules matching the `:marker` pseudo-element.
- **:before** - Displays the rules matching the `:before` pseudo-element.
- **:after** - Displays the rules matching the `:after` pseudo-element.
- **Computed** - Displays all the styling properties that apply to the current element, as a result of all the CSS rules matching the element.
- **Path** - Displays the path for the current element, and its attributes, allowing you to quickly see the attributes on all parent elements, and allows you to copy fragments from this view and paste it into the associated CSS to easily create new rules.

The information displayed in each of the five tabs is updated when you click other elements in the **Author** editing view. The first three tabs include the link to the associated CSS source, while the other two tabs simply display the style properties that match the current element.

Each of the tabbed panes include a contextual menu with the following actions:

- **Copy** - copies the current selection
- **Select all** - selects all information listed in the pane
- **Show empty rules** - forces the view to show all the matching rules, even if they do not declare any CSS properties (by default, the empty rules are not displayed)

Reviewing Documents

Oxygen XML Editor includes a variety of helpful review tools that improve your ability to collaborate with other members of your team, track changes, mark content for various reasons, add comments in your content, and to manage the review features.

Tracking Document Changes

The *Track Changes* feature *(on page 3424)* is a way to keep track of the changes you make in a document. The *Track Changes* feature highlights changes that you make to the content in a document, as well as changes to attributes. Changes can be tracked for insertions and deletions. When the *Track Changes* feature is activated *(on page 654)*, insertions are rendered in **Author** mode with an underline while deletions are rendered with a strike through.

The *tracked changes* are also displayed in the **Review** view *(on page 675)* and you can also choose to present the changes in callouts *(on page 669)* by selecting the **Track Changes Deletions** *(on page 194)* and **Track Changes Insertions** *(on page 194)* options in the **Callouts** preferences page *(on page 194)*.

Adding Comments in Documents

You can associate a comment to a selected area of content. Comments can highlight virtually any content from your document, with the exception of *read-only* text. The difference between using comments and *change tracking* is that a comment can be associated to an area of text without modifying or deleting the text.

Comments are presented in callouts *(on page 669)* with persistent highlights and a colored background. The background color is assigned automatically by the application, but it can also be customized from the **Review** preferences page *(on page 191)*.

Highlighting Content

Oxygen XML Editor includes a highlighting feature that allows you to create digital markers to emphasize important fragments of your documents. This is especially useful when you want to mark content that needs additional work or the attention of others.

Using the Review View

Oxygen XML Editor includes a **Review** view *(on page 675)* that provides a simplified way of monitoring all the insertions, deletions, comments, and highlights in an XML document. This handy tool is especially useful for large teams that need to gather and manage all the edits from all team members who are working on the same project.

The **Review** view is also useful for managing *tracked changes* and comments in a single panel. In this view, the changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes and comments in the main editing area.

You can use this view to quickly navigate through changes, accept or reject them, or to view and manage comments or highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Printing Review Information

When you print a document from **Author** mode, whatever review information is shown in the main editing area will be included in the printed output. For example, *tracked changes* will be included and as long as the **Comments** option *(on page 194)* is selected in the **Callouts** preferences page *(on page 194)*, comment callouts will also be included (same with *tracked change* callouts if their corresponding options are selected in the **Callouts** preferences page *(on page 194)*.

Managing Tracked Changes

Oxygen XML Editor includes a *Track Changes* feature *(on page 3424)* that allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the **Review** view *(on page 675)*.

The *Track Changes* feature is also able to keep track of changes you make to attributes in a document and the changes are presented in the **Review** view *(on page 675)* and **Attributes** view *(on page 638)*.

Types of Tracked Changes

The types of *tracked changes* include:

- Inserting, deleting content (text or elements)
- Drag and drop content (text or elements)
- Cutting or pasting content (text or elements)
- Inserting, deleting, and changing the structure of tables
- Inserting and editing lists and their content
- Inserting and deleting entities
- Inserting and deleting element tags
- Editing attributes
- Performing a **Split** operation
- Performing a **Surround with** operation
- Changes in referenced content (for example, XInclude fragments or DITA conrefs)

Important:
If you copy content in **Author** mode that contains *tracked changes*, the changes will automatically be accepted prior to the content being copied to the clipboard. This filtering is performed only if the selection is not entirely inside a tracked change.

Activating the Change Tracking Feature

To activate the *Track Changes* feature for the current document, use any of the following methods:

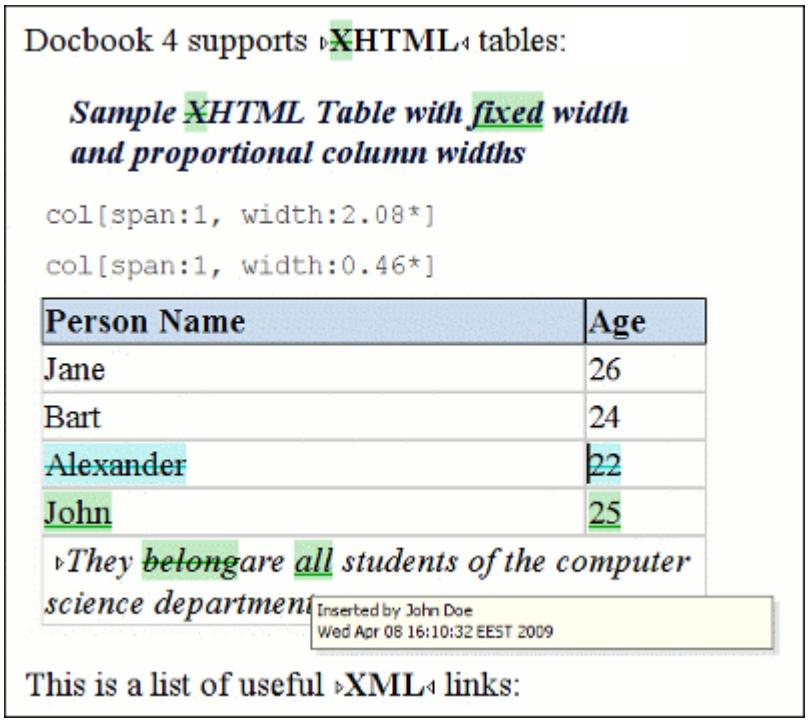
- Click the **Track Changes** button on the toolbar.
- Select **Track Changes** from the **Review** submenu of the contextual menu in the main editing area in **Author** mode.
- Select **Track Changes** from the **Edit > Review** menu.

To activate the *Track Changes* feature globally for all documents that you open in Oxygen XML Editor, change the **Initial State** option to **Always On** *(on page 191)* in the **Review** preferences page *(on page 191)*.

Rendering Tracked Changes in Author Mode

When *Track Changes (on page 3424)* is enabled, your modifications are highlighted using a distinctive color. The colors can be customized from the **Review** preferences page *(on page 191)*, along with the name of the author and the initial state of the feature when you open a document. Insertions are rendered with an underline while deletions are rendered with a strike through.

Figure 169. Change Tracking in Author Mode



When hovering over a change a tooltip displays information about the author and modification time.

Change Tracking Contextual Menu Actions

You can right-click any change in **Author** mode to access the following contextual menu actions:

Accept Change(s)

Accepts the *Tracked Change (on page 3424)* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

Reject Change(s)

Rejects the *Tracked Change (on page 3424)* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 3424)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Change Tracking Toolbar Actions

By default, the toolbar includes the following actions and options for reviewing or *tracking changes (on page 3424)* (similar actions are also available in the **Edit > Review** menu and the **Review** submenu of the contextual menu):

Track Changes

Enables or disables the *Track Changes (on page 3424)* support for the current document.

Accept Change(s) combo box

This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

- **Accept Change(s) and Move to Next** - Accepts the *Tracked Change (on page 3424)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.
- **Accept Change(s)** - Accepts the *Tracked Change (on page 3424)* located at the cursor position or all of the changes in a selection.
- **Accept All Changes** - Accepts all *Tracked Changes (on page 3424)* in the current document.

> **Tip:**
> You can assign shortcut keys *(on page 303)* for these actions to make it easier to access them.

Reject Change(s) combo box

This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

- **Reject Change(s) and Move to Next** - Rejects the *Tracked Change (on page 3424)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.
- **Reject Change(s)** - Rejects the *Tracked Change (on page 3424)* located at the cursor position or all of the changes in a selection.
- **Reject All Changes** - Rejects all *Tracked Changes (on page 3424)* in the current document.

> **Tip:**
> You can assign shortcut keys *(on page 303)* for these actions to make it easier to access them.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 3424)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Track Changes Visualization Modes Drop-Down Menu

This drop-down menu includes specialized actions that allow you to switch between the following visualization modes:

- **View All Changes/Comments** - This mode is active by default. When you use this mode, all tracked changes are represented in the **Author** mode.
- **View only Changes/Comments by** - Only the tracked changes made by the author you select are presented.
- **View Final** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were accepted.
- **View Original** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were rejected. If you attempt to edit the document in this mode, the view mode will switch to **View All Changes/Comments**.
- **Review Settings** - Opens the Review Preferences *(on page 191)* page where the **Initial display mode** setting can be configured.

> **Note:**
> If you use **View Final** mode and **View Original** mode, *callouts (on page 3418)* are not displayed for comments or changes. To display callouts, use the **View All Changes/Comments** mode.

Highlight

Enables or disables the **Highlight** tool *(on page 667)*. Use the **Highlight** drop-down menu to select a new color.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the **Review** view *(on page 675)*.

Tracked Change Callouts

You can also choose to display insertion and deletion changes in *callouts (on page 3418)* in **Author** mode. By default, tracked changes are not displayed in callouts, but you can change this behavior by selecting the **Track Changes Deletions** *(on page 194)* and **Track Changes Insertions** *(on page 194)* options in the **Callouts** preferences page *(on page 194)*. You can also choose to display the actual content of the deletion or insertion.

By displaying the changes in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. For more information, see Author Callouts *(on page 669)*.

Tracked Changes in the Review View

The **Review** view *(on page 675)* is also useful for managing tracked changes and comments. In this view, the edits are presented in a compact form, in the order they appear in the document and each edit is marked with a type-specific icon. You can use this view to quickly navigate through changes, accept or reject them, or to add and manage comments for the changes. You can also search for specific changes and it includes some filtering options (for example, you can filter it to only show certain types of changes or to only show changes for a particular author).

For more information, see Review View *(on page 675)*.

Tracked Changes XML Source Code

The changes are stored in the document source code as processing instructions and they do not interfere with validation or transformations. For each change, the author name and the modification time are preserved.

Example - Insertion Change: The following processing instruction is an example of how an *insertion* change is stored in a document:

```
<?oxy_insert_start author="John Doe" timestamp="20090408T164459+0300"?>all<?oxy_insert_end?>
```

Example - Deletion Change: The following processing instruction is an example of how a *deletion* change is stored in a document:

```
<?oxy_delete author="John Doe" timestamp="20090508T164459+0300" content="belong"?>
```

Review View *(on page 675)*

Tracked Changes Behavior

The behavior of the *Track Changes* feature *(on page 3424)* depends on the context, the type of change, and whether or not it is activated.

Inserting Content

If the *Track Changes* feature is disabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in an **Insert** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in regular content results in a regular insertion.

If the *Track Changes* feature is enabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the current inserted content appears marked as an INSERT.
- Making an insertion in an **Insert** change results in the following:
    - If the original insertion was made by another user, the change is split in two and the current inserted content appears marked as an INSERT by the current author.
    - If the original **Insert** change was made by the same user, the change is just expanded to contain the inserted content. The creation time-stamp of the previous insert is preserved.
- If inserted in regular content, the current inserted content appears marked as an **Insert** change.

Surrounding Content

If the *Track Changes* feature is enabled and you surround content in a new XML element, the following behavior is possible:

- Making a surround in a **Delete** change results in nothing happening.
- Making a surround in an **Insert** change results in the following:
    - If the original insertion was made by another user, the change is split in two and the surround operation appears marked as being performed by the current author.
    - If the original **Insert** change was made by the same user, the existing change is just expanded to contain the surrounded content.
- Making a surround in regular content results in the operation being marked as a surround change.

Deleting Characters

If the *Track Changes* feature is disabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing **Delete** change results in nothing happening.
- Deleting content in an existing **Insert** change results in the content being deleted without being marked as a deletion and the INSERT change shrinks accordingly.
- Deleting in regular content results in a regular deletion.

If the *Track Changes* feature is enabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing **Delete** change results in the following:
    - If the same author created the **Delete** change, the previous change is marked as deleted by the current author.
    - If another author created the **Delete** change, nothing happens.
- Deleting content in an existing **Insert** change results in the following:

    - If the same author created the **Insert** change, the content is deleted and the **Insert** change shrinks accordingly.
    - If another author created the **Insert** change, the **Insert** change is split in two and the deleted content appears marked as a **Delete** change by the current author.
- Deleting in regular content results in the content being marked as a **Delete** change by the current author.

Deleting Selections of Content

If the *Track Changes* feature is disabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire **Delete** change, the change disappears and the content is deleted.
- If the selection intersects with a **Delete** change (starts or ends in one), it results in nothing happening.
- If the selection contains an entire **Insert** change, the change disappears and the content is deleted.
- If the selection intersects with an **Insert** change (starts or ends in one), the **Insert** change is shrunk and the content is deleted.

If the *Track Changes* feature is enabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire **Delete** change, the change is considered as rejected and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects a **Delete** change (starts or ends in one), the change is considered as rejected and marked as deleted by the current author, along with the other selected content.
- If the selection contains an entire **Insert** change, the following is possible:
    - If the **Insert** is made by the same author, the change disappears and the content is deleted.
    - If the **Insert** is made by another author, the change is considered as accepted and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects an **Insert** change (starts or ends in one), the **Insert** change shrinks and the part of the **Insert** change that intersects with the selection is deleted.

Deleting Tags

Assuming you are using any of the *Tag Display Modes (on page 604)* other than **No Tags** and the *Track Changes* feature is disabled, if you delete a start or end tag, both the start and end tag will be removed, while any content that was inside the element is preserved.

Assuming you are using any of the *Tag Display Modes (on page 604)* other than **No Tags** and the *Track Changes* feature is enabled, if you delete a start tag of an *inline element (on page 3420)*, both the start and end tag are marked as a **Delete** change by the current author, while any content that was inside the element is preserved.

Copying Content

If the *Track Changes* feature is disabled and you copy content, if the copied area contains **Insert** or **Delete** changes (or attribute edits), these are also copied to the clipboard.

If the *Track Changes* feature is enabled and you copy content, if the copied area contains **Insert** or **Delete** changes (or attribute edits), these are all accepted in the content of the clipboard (the changes will no longer be in the clipboard).

Pasting Content

If the *Track Changes* feature is disabled and you paste content, if the clipboard content contains **Insert** or **Delete** changes (or attribute edits), they will be preserved on paste.

If the *Track Changes* feature is enabled and you paste content, if the clipboard content contains **Insert** or **Delete** changes (or attribute edits), all the changes are accepted and then the paste operation proceeds according to the insertion rules.

Track Changes Limitations

There are some inherent limitations to the *Change Tracking (on page 3424)* feature. These limitations include the following:

- **Limitations to rejected changes** - Recording changes has limitations and there is no guarantee that rejecting all changes will return the document exactly to its original state.
- **Limitations to hierarchical changes** - Recorded changes are not hierarchical, a change cannot contain other changes inside. For example, if you delete an insertion made by another user, then reject the deletion, the information about the author who made the previous insertion is not preserved.
- **Limitations to using certain actions** - Some actions cannot be implemented with the *Track Changes* feature *(on page 3424)* enabled. For example, some table-related actions ( **Delete Row(s)**,  **Delete Column(s)**,  **Join Cells**,  **Split Cell**) ignore the *Track Changes* feature.
- **Possible Serialization Limitation** - If you have equivalent adjacent tracked changes, for example, you see two back-to-back changes in the **Review** pane that have identical properties (the same user, timestamp, content, etc.), when you save the document, it is sometimes possible for the document to only contain a single processing instruction.

DITA-Specific Track Changes Limitations

- When presenting cross references or related links in the **Author** visual editing mode, if the link target element has a title that contains change tracking, the presented link reference content is shown as if all tracked changes in the target element's title have been accepted.
- When presenting phrases with key references in the **Author** visual editing mode, if the defined key has a keyword that contains change tracking, the presented referenced keyword reference content is shown as if all track changes inside it have been accepted.

Publishing-Specific Track Changes Limitations

- **Deletion Change Tracking Limitation** - When displaying tracked changes in published outputs (for example, when enabling the `show.changes.and.comments` DITA parameter in WebHelp and PDF publications), the deleted content will be presented as plain XML with the tag names serialized as plain text. Key references and content key references are also not resolved in the presented deleted content.

Tracked Changes XML Markup

Depending on the type of edits, the following markup appears in the document source code when you activate the *Track Changes* feature *(on page 3424)*:

Edit Type	Processing Instruction Start Marker	Processing Instruction End Marker	Attributes
Insertion	`<?oxy_insert_start?>`	`<?oxy_insert_end?>`	Common Attributes *(on page 663)*
Split	`<?oxy_insert_start?>`	`<?oxy_insert_end?>`	Common Attributes *(on page 663)*, type="split"
Surround	`<?oxy_insert_start?>`	`<?oxy_insert_end?>`	Common Attributes *(on page 663)*, type="surround"
Deletion	`<?oxy_delete?>`	_	Common Attributes *(on page 663)*, `content`
Comment	`<?oxy_comment_start?>`	`<?oxy_comment_end?>`	Common Attributes *(on page 663)*, `mid`, `parentID`
Attribute Change	`<?oxy_attributes?>`	_	Attributes of the *Processing Instruction* have the name as the attribute that was changed on the *XML element*. The value is an attribute change descriptor *(on page 664)*.

If a comment intersects another, the `@mid` attribute is used to correctly identify start and end processing instruction markers.

Common Attributes

The following attributes can be added on both change tracking and comment processing instructions:

- `@id` - Used to link a reply to its parent comment or change.
- `@comment` - The comment message associated with a comment or change.
- `@timestamp` - The time when the change or comment was created.

- `@author` - The name of the author that created the change or comment.
- `@flag` - The value `done` means that the item is **Marked as Done**.

Attribute Change Descriptor

The value of the attributes for a *Processing Instruction* is an (escaped) XML element as in:

```
<change type="modified" oldValue="word" author="John" timestamp="20210520T091038+0000" />
```

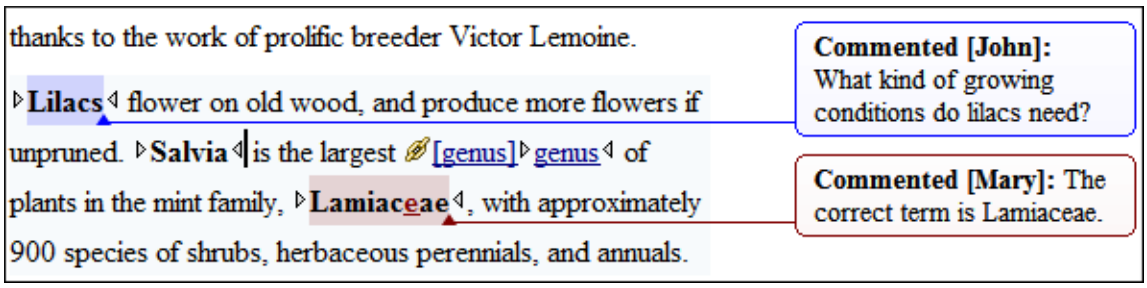
Managing Comments

You can add comments to any selected area of content within XML documents, with the exception of *read-only* content. The difference between using comments and *tracked changes (on page 3424)* is that a comment is associated to a selection without modifying or deleting the content.

By default, when you annotate your XML documents, the comments are displayed in the **Author** mode as *callouts (on page 3418)* (balloons) and they are rendered with a unique name and background for each user. If comments are not currently displayed in callouts, select the **Comments** option *(on page 194)* in the **Callouts** preferences page *(on page 194)*. Comments are also displayed in the **Review** view *(on page 675)*.

Figure 170. Comments in Author Mode



Managing Comments in the Main Editor

You can insert and manage comments directly in the main editing area in **Author** mode.

Add Comment

To insert a comment at the cursor position or on a specific selection of content, select the **Add Comment** action from the toolbar (or in the **Review** submenu of the contextual menu).

Tip:
When adding or editing a comment, you can use **Enter** to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

Show/Edit Comments

To edit an existing comment that you have added in the main editing area in **Author** mode, select the **Show/Edit Comments** action from the toolbar (or in the **Review** submenu of the contextual menu). The action opens a dialog box that allows you to see and edit your comment at the cursor position. Note that you cannot edit a comment that was added by another user, so in that case, the dialog box just displays the comment without the possibility of editing it.

Remove Comments

To remove a comment at the cursor position or multiple comments in a selection, select **Remove Comment(s)** from the toolbar (or in the **Review** submenu of the contextual menu).

Copy/Paste

If you copy content that includes comments, they will be preserved when you paste it.

Managing Comments in Callouts

As long as the **Comments** option *(on page 194)* is selected in the **Callouts** preferences page *(on page 194)*, comments are also displayed in callouts *(on page 669)*. By displaying the comments in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. When you right-click a specific comment in its callout, the contextual menu includes the following actions.

Reply

Opens a dialog box that allows you to add a reply to a comment or *Tracked Changes (on page 3424)*. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view *(on page 675)*.

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for *Tracked Changes (on page 3424)* that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Callouts Options

Select this option to open the **Callouts** preference page *(on page 194)* where you can configure various callout options.

Tip:
When adding, editing, or replying to a comment, you can use **Enter** to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

Managing Comments in the Review View

The **Review** view *(on page 675)* is also useful for managing comments. In this view, comments are presented in a compact form, in the order they appear in the document, along with tracked changes. You can also use this view to search for specific comments and it includes some filtering options (for example, you can filter it to only show comments for a particular author). When you right-click a specific comment in the **Review** view, the contextual menu includes the following actions.

Reply

Opens a dialog box that allows you to add a reply to a comment or *Tracked Changes (on page 3424)*. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view *(on page 675)*.

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for *Tracked Changes (on page 3424)* that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Show only reviews by '<author name>'

Filters the comments to only show comments for the particular author.

Remove all Comments

Removes all comments from the document.

Comments XML Source Code

The comments are stored in the document source code as processing instructions that contain information about the author name and the comment time:

```
<?oxy_comment_start author="John Doe" timestamp="20090508T164459+0300"
 comment="Do not change this content"?>
    Important content
<?oxy_comment_end?>
```

Replies to comments are stored in the document source code as a comment (with information about the author name and time), but with a `@parentID` attribute and its value is the same as the `@id` value of the parent comment.

```
<?oxy_comment_start author="Tom" timestamp="20160217T102630+0200"
comment="We should not forget about recycling the oil and oil filter!"
parentID="vws_x4l_1v" mid="4"?>
```

Author Callouts *(on page 669)*
Review View *(on page 675)*

Managing Highlights

Use the **Highlight** tool to mark fragments in your document using various colors. This is especially useful when you want to mark sections that need additional editing or to draw the attention of others to particular content.

Using the Highlight Tool

You can find the **Highlight** action on the main toolbar, in the **Edit > Review** menu, or in the **Review** submenu of the contextual menu of a document. You can also choose the color to use for the highlight or choose to **Stop highlighting** from the same menus.

To highlight content, follow these steps:

1. Click the **Highlight** icon on the toolbar.

   Step Result: The highlighting mode is on and the cursor changes to a dedicated symbol.

2. Click the small arrow next to the **Highlight** icon and select the color that you want to use for the highlighting.

3. Select the content you want to highlight. To mark multiple parts of a document, press and hold **Ctrl (Meta on macOS)** and select the parts you want to highlight.
4. To exit the highlighting mode, press **Esc**, click the  **Highlight** icon, or start editing the document.

To remove highlighting from a document, follow these steps:

1. Either select the text you want to remove highlighting from using your cursor, or press **Ctrl + A (Command + A on macOS)** if you want to select all of the text.
2. Click the small arrow next to the  **Highlight** icon and select **No color (erase)**, or right-click the highlighted content and select **Remove highlight(s)**.
3. To exit the highlighting mode, press **Esc**, click the  **Highlight** icon, or start editing the document.

Note:
Oxygen XML Editor preserves the highlighting of a document between working sessions. Also, if you copy content that includes highlights, the highlighting will be preserved when you paste it.

Review View

The **Review** view *(on page 675)* is also useful for managing highlights. In this view, the highlights are presented in a compact form, in the order they appear in the document, along with *tracked changes (on page 3424)* and comments. The following actions are available in the contextual menu of each highlight in the **Review** view:

Change Color

Allows you to change the color of an existing highlight by selecting the new color from this menu.

Remove Highlight

Removes the selected highlight.

Remove Highlights with the Same Color

Removes the selected highlight and all others that have the same color.

Remove All Highlights

Removes all highlights from the document.

Highlights XML Source Code

The highlights are stored in the document source code as processing instructions that contain information about the color:

```
<?oxy_custom_start type="oxy_content_highlight" color="0,128,255"?>
  The highlights are stored<?oxy_custom_end?>
```

Related Information:
Review View *(on page 675)*

Author Callouts

Oxygen XML Editor uses *callouts (on page 3418)* to present comments and *tracked change (on page 3424)* modifications that you or other members of your team have added to the document.

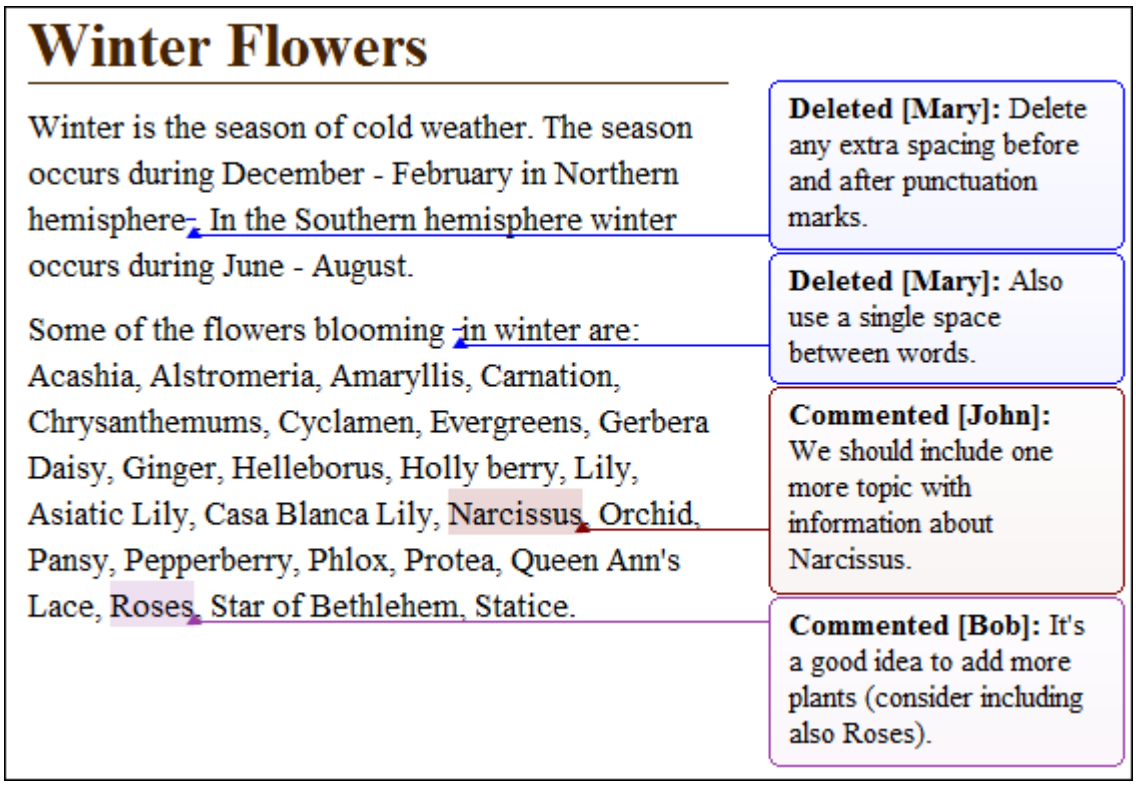
Displaying Callouts in Author Mode

The callouts are displayed in the right side of the editing area in **Author** mode. They are decorated with a colored border and also have a colored background. The background color is assigned automatically by the application depending on the user who is editing the document and the type of change, but it can also be customized from the **Review** preferences page *(on page 191)*. This preferences page allows you to configure the colors for tracked change insertions or deletions, and for comments.

You can also choose to use the same color for all changes of that particular type of change, regardless of who makes the change. To do this, select the **Fixed** option for the particular type of change and choose a color from the color box. If the **Automatic** option is selected, Oxygen XML Editor automatically assigns a color based upon the **Colors for automatic assignment** list *(on page 193)*.

The horizontal line that connects the callouts to their corresponding text fragments has the same color as the border. If this horizontal line is not visible, select the **Show all connecting lines** option *(on page 194)* in the **Callouts** preferences page. If you hover over a callout, it is highlighted and a tooltip is displayed that contains additional information.

Figure 171. Multiple Author Callouts

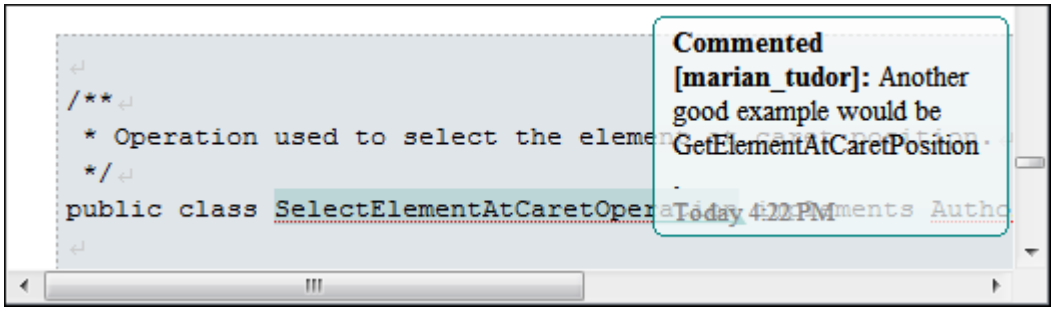


Note:

Oxygen XML Editor displays callouts only if **View All Changes/Comments** or **View Only Changes/Comments by** is selected in the **Track Changes Visualization Modes** drop-down menu. Oxygen XML Editor does not display callouts in **View Final** and **View Original** modes.

In some cases, the text you are editing can span into the callouts area. For example, this situation can appear for callouts associated with wide images or *space-preserved elements (on page 3424)* that contain long fragments (such as a DITA `<codeblock>` element or `<programlisting>` in DocBook). To help you view the text under the covered area, Oxygen XML Editor applies transparency to these callouts. When the cursor is located under a callout, the transparency is enhanced, allowing you to both edit the covered content and access the contextual menu of the editing area.

Figure 172. Transparent Callout



Adjusting Callout Width

To display more of the content in all the callouts in the current document, you can adjust the width by dragging the left side of any of the callouts. This will adjust the width for all comments in the current document. When you end the current editing session, the width of all callouts will revert back to the default value, which is the value of the **Initial Width** option *(on page 194)* in the **Callouts** preferences page.

You can also adjust the maximum number of lines to be shown in the callouts using the **Text Lines Count Limit** option *(on page 194)*. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it.

Type of Callouts in Oxygen XML Editor

Oxygen XML Editor uses callouts to display comments and *Tracked Changes (on page 3424)* that you associate with fragments of the document you are editing. You can choose which types of edits will be shown in callouts by configuring the options in the **Callouts** preferences page *(on page 194)*. You can choose to enable the following types of review callouts:

- **Comment Callouts** - As long as the **Comments** option *(on page 194)* is selected in the **Callouts** preferences page *(on page 194)*, comments are displayed in callouts. A comment callout contains the name of the author who inserts the callout and the comment itself. You can also select the **Show review time** option *(on page 194)* to include timestamp information in the comment callouts.

  Figure 173. Comment Callouts

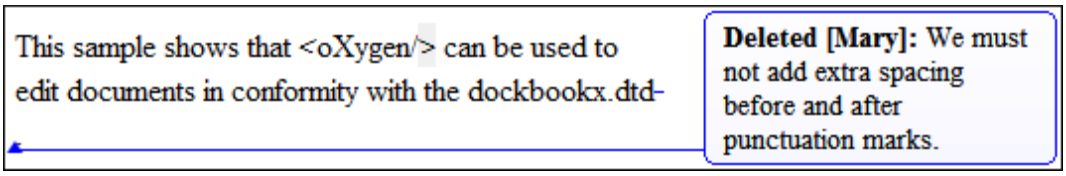
  
  There are several types of comments that can be added in **Author** mode:
  - *Author Review Comments* - Comments that you associate with specific content. To insert this type of comment, select the content and use the **Add Comment** action that is available on the toolbar (or in the **Review** submenu of the contextual menu).
  - *Comments Added to Tracked Changes* - Comments that you add to an already existing *tracked change* insertion or deletion. To insert this type of comment, right-click the change in the main editor or its callout and select **Comment Change**.
  - *Replies to Comments* - You can use this type of comment to create discussion threads. To insert this type of comment, right-click the change in its callout and select **Reply**. A single callout is presented for a root comment or change and its replies. The replies are displayed with an indentation in the callouts and those that are on the same level are sorted depending on the timestamp.

Figure 174. Callout for a Comment with Replies

Tip:
When adding, editing, or replying to a comment, you can use **Enter** to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

- **Tracked Change Deletion Callouts** - As long as the **Track Changes Deletions** option *(on page 194)* is selected in the **Callouts** preferences page *(on page 194)*, deletions that are made while the *Track Changes* feature is enabled are displayed in callouts. A deletion callout contains the type of callout (**Deleted**) and the name of the author that made the deletion. You can also select the **Show deleted content in callout** option *(on page 194)* to display the actual deleted content in the callout. Additionally, you can select the **Show review time** option *(on page 194)* to include timestamp information in the deletion callouts.

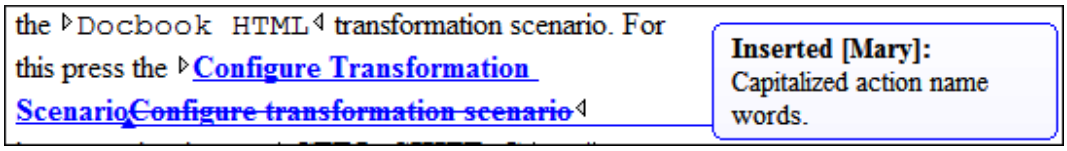
Figure 175. Deletion Callouts



- **Tracked Change Insertion Callouts** - As long as the **Track Changes Insertions** option *(on page 194)* is selected in the **Callouts** preferences page *(on page 194)*, insertions that are done while the *Track Changes* feature is enabled are displayed in callouts. An insertion callout contains the type of callout (**Inserted**) and the name of the author that inserted the content. You can also select the **Show inserted content in callout** option *(on page 194)* to display the actual deleted content in the callout. Additionally,

you can select the **Show review time** option *(on page 194)* to include timestamp information in the deletion callouts.

Figure 176. Insertion Callouts



Callout Contextual Menu Actions

Some useful actions are available when the contextual menu is invoked on a callout. The actions depend on the type of callout.

Insertion or Deletion Callout Actions

The following actions are available in the contextual menu of an insertion or deletion callout:

Reply

Opens a dialog box that allows you to add a reply to a comment or *Tracked Changes (on page 3424)*. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view *(on page 675)*.

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for *Tracked Changes (on page 3424)* that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Accept Change

Accepts the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

Reject Change

Rejects the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 3424)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

Callouts Options

Select this option to open the **Callouts** preference page *(on page 194)* where you can configure various callout options.

Comment Callout Actions

The following options are available in the contextual menu of a comment callout:

Reply

Opens a dialog box that allows you to add a reply to a comment or *Tracked Changes (on page 3424)*. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view *(on page 675)*.

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for *Tracked Changes (on page 3424)* that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

Callouts Options

Select this option to open the **Callouts** preference page *(on page 194)* where you can configure various callout options.

Printing Callouts

When you print a document from **Author** mode, all callouts that you or other authors have added to the document are printed. For a preview of the document and its callouts, go to **File > Print Preview**.

Review View

The **Review** view *(on page 675)* is also useful for managing the information in callouts. In this view, changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes in the callouts. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

For more information, see Review View *(on page 675)*.

Related information

Managing Tracked Changes *(on page 654)*
Managing Comments *(on page 664)*
Review View *(on page 675)*

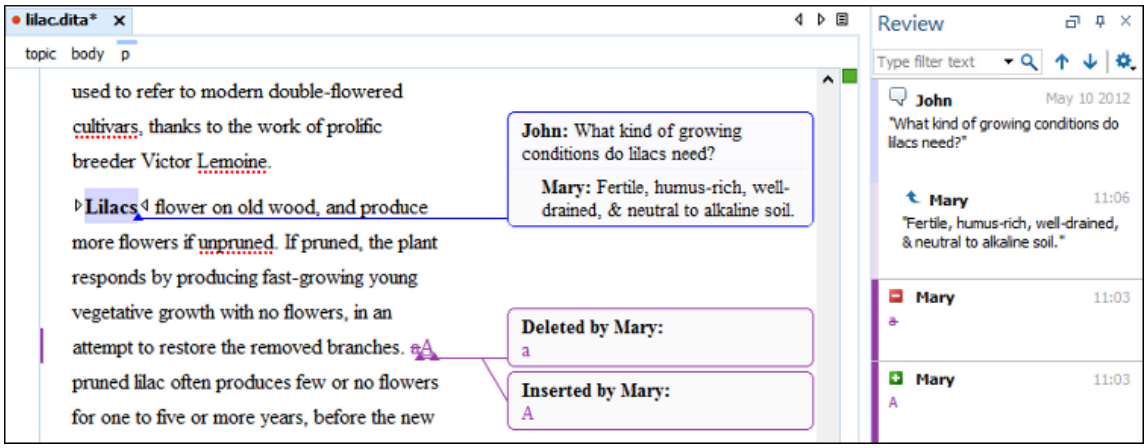
Review View

The **Review** view is an independent panel, available both for built-in and custom XML document *frameworks (on page 3420)*. It is designed to offer an enhanced way of monitoring all the changes that you make to a document. This means you can view and manage highlights, comments, and *tracked changes (on page 3424)* using a single view.

The **Review** view is useful when you are working with documents that contain large number of edits. The edits are presented in a compact form, in the order they appear in the document. Each type of edit is marked with a specific icon. This view and the editing area are synchronized. When you select an edit listed in the **Review** view, its corresponding fragment of text is highlighted in the editing area and the reverse is also true. For example, when you place the cursor inside an area of text marked as inserted, its corresponding edit is selected in the list.

You can use this view to quickly navigate through changes and it includes some useful hover actions and contextual menu actions to help you manage changes, comments, and highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Figure 177. Review View



Activating the Review View

To activate the **Review** view, do one of the following:

- Click the **Manage reviews** button on the toolbar.
- Right-click anywhere in a document and select **Review > Manage reviews**.
- Open it from the **Window > Show View** menu.

Review View Toolbar Actions and Settings

The upper part of the view contains a filtering area that allows you to search for specific edits. The filter field also includes a search history drop-down list. The toolbar also includes **Previous** and **Next** navigation buttons and a **Settings** menu button.

Previous

Use this button to navigate to the previous review item.

For DITA projects, as long as the **Link with Editor** toolbar button *(on page 3077)* is enabled in the **DITA Maps Manager**, if you reach the first review item in the document, clicking this button will open a dialog box asking if you want to open the previous document (from the current DITA map hierarchy) that contains review items. This default behavior can be changed by choosing one of the options in the **When navigating items in the Review view and you reach the last/first item** section of the **DITA** preferences page *(on page 282)*.

Next

Use this button to navigate to the next review item.

For DITA projects, as long as the **Link with Editor** toolbar button *(on page 3077)* is enabled in the **DITA Maps Manager**, if you reach the last review item in the document, clicking this button will open a dialog box asking if you want to open the next document (from the current DITA map hierarchy) that contains review items. This default behavior can be changed by choosing one of the options in the **When navigating items in the Review view and you reach the last/first item** section of the **DITA** preferences page *(on page 282)*.

Settings

The **Settings** menu includes the following options:

Show highlights

Controls whether or not the **Review** view displays the highlighting in your document.

Show comments

Controls whether or not the **Review** view displays the comments in the document you are editing.

Show track changes

Controls whether or not the **Review** view displays the inserted and deleted content in your document.

Show reviews in read-only content

Controls whether or not the **Review** view displays review items from content referenced with a `@conref` or `@conkeyref` attribute.

Show review time

Displays the time when the edits from the **Review** view were made.

Sort by date

Expands to offer the following sorting options: **Oldest to newest**, **Newest to oldest**, and **No sorting**.

Configure review options

Opens the **Review** preferences page *(on page 191)* where you can configure various options for review information.

Hover Actions in the Review View

You can use this view to easily manage changes, highlights, and comments that have been added by you or other users. The following actions are available when you hover over the changes in the **Review** view:

Remove

Available for highlights and comments presented in the **Review** view and it removes the particular highlight or comment from your document and moves to the next change.

Accept

Available for inserted and deleted content presented in the **Review** view and it accepts the particular change in your document and moves to the next change.

Reject

Available for inserted and deleted content presented in the **Review** view and it rejects the particular change in your document and moves to the next change.

Contextual Menu Actions in the Review View

Depending on the type of an edit, the following additional actions are available in the contextual menu of the **Review** view:

Reply

Opens the **Reply** dialog box where you can add a reply to comment or change. The replies are displayed with an indentation in this view.

Mark as Done

Toggles the comment or change as being done and grays it out. You can mark a whole discussion thread as being done by selecting the action on the first (parent) comment in the thread.

 **Show Comment**

Available for comments added by other users and you can use this option to view it in a **Show comment** dialog box.

 **Edit Comment**

Available for comments you have added and you can use this action to edit a comment.

 **Remove Comment**

Use this action to remove the selected comment.

Show only Reviews by '<author name>'

Use this action to filter the edits to only show them for a certain author.

Remove All Comments

Use this action to remove all the comments that appear in the edited document.

Change Color

Available for highlights and it opens a palette where you can choose a new color for the highlighted content.

Remove Highlight

Available for highlights and you can use this action to remove the selected highlight.

Remove Highlights with the Same Color

Available for highlights and you can use this action to remove all the highlights with the same color from the entire document.

Remove All Highlights

Available for highlights and you can use this action to remove all the highlights in your document.

Accept Change

Accepts the selected change and moves to the next change.

Reject change

Rejects the selected change and moves to the next change.

Comment change

Available for insertions or deletions and you can use this option to add a comment for the particular change.

Accept all changes

Accepts all the changes in the current document.

Reject all changes

Rejects all the changes in the current document.

Publishing Tracked Changes, Comments, and Color Highlights

By default, tracked changes do not influence the published output. However, certain parameters can be enabled to display tracked changes and comments in **WebHelp Responsive** and **PDF** output:

- **WebHelp Responsive** - Enable the `webhelp.show.changes.and.comments` publishing parameter. For more details, see: WebHelp Responsive Transformation Parameters *(on page 1787)*.
- **PDF (CSS based)** - Enable the `show.changes.and.comments` publishing parameter. For more details, see: DITA Map PDF - based on HTML5 & CSS Transformation *(on page 1487)*.
- **PDF (XSL-FO based)** - Enable the `show.changes.and.comments` publishing parameter.

Profiling and Conditional Text

Profiling text is a way to mark blocks of text meant to appear in some renditions of the document but not in others. Conditional text differs from one variant of the document to another, while unconditional text appears in all document versions. For example, you can mark a section of a document that is to be included in a manual to be designated for *expert* users and another section for *novice* users, while unmarked sections are included in all renditions.

Profiling Attributes and Condition Sets

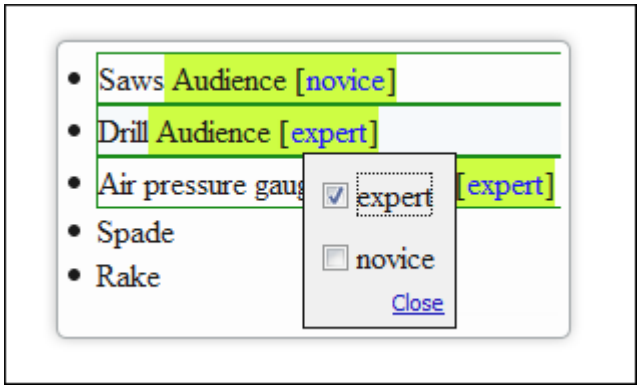
Oxygen XML Editor allows you to define values for the profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. You can also conditionally profile parts of a document so that certain parts are displayed when certain profiling conditions are set. You can even customize the colors and styling of how the profiling is displayed in **Author** mode.

You can use profiling and conditional text to help you create documentation for multiple output scenarios, including:

- Multiple outputs for a series of similar products.
- Multiple outputs for various releases of a product.
- Multiple outputs for various audiences.

This feature helps to reduce the effort for updating and translating your content and provides an easy way to customize the output for various audiences.

Figure 178. Example: Profiling Content



Oxygen XML Editor includes a preconfigured set of profiling attribute values for some of the most popular document types. These attributes can be redefined to match your specific needs in the **Attributes and Condition Sets** preferences page *(on page 195)*. You can also define your own profiling attributes and condition sets for each document type (*framework (on page 3420)*) and your profiling configuration can be shared among content authors through the project file.

For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes *(on page 681)* (for information about sharing them, see Sharing Profiling Attribute Configurations *(on page 684)*Sharing Profiling Attribute Configurations *(on page 3323)*).

For information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets *(on page 686)* (for information about sharing them, see Sharing Condition Set Configurations *(on page 688)*).

Related Information:

Customizing Elements that Wrap Profiled Content *(on page 2381)*

Creating and Editing Profiling Attributes

Oxygen XML Editor includes support for defining your own profiling attributes, or modifying existing ones, for each particular document type (*framework (on page 3420)*). You can then apply the profiling attributes to content in **Author** mode to see how the profiling will affect the output.

Create or Editing Profiling Attributes

To create or edit profiling attributes for a specific document type, follow these steps:

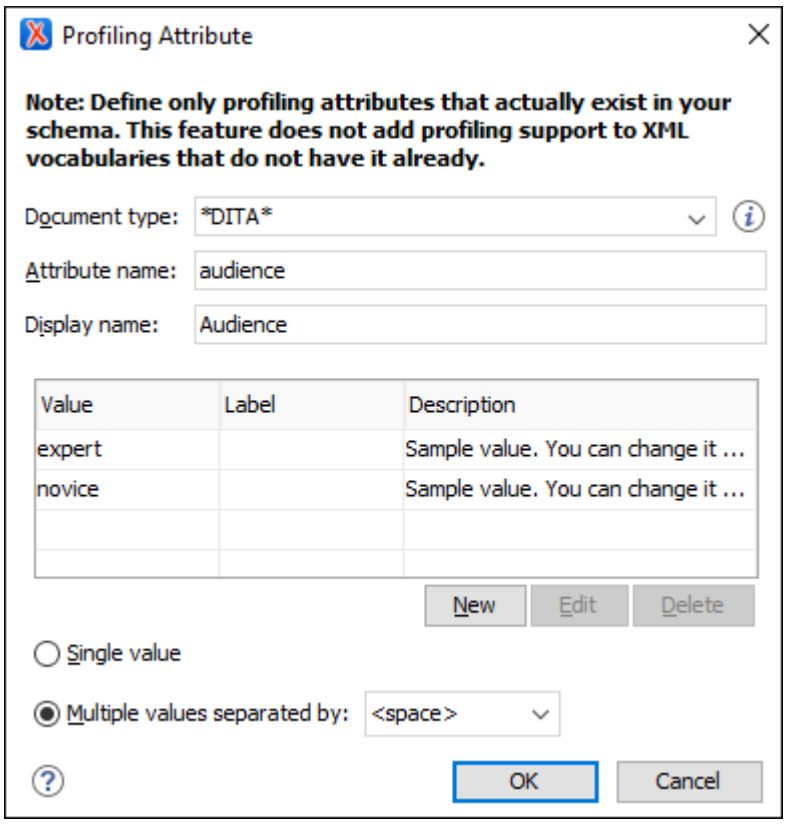
1. If you are creating a new attribute, make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.
2. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Attributes and Condition Sets**.

   Information:
   The **Profiling Attributes** section *(on page 196)* is used to define the attributes and their values for each document type.

3. To add new attributes and values, click the **New** button at the bottom of the **Profiling Attributes** table. To customize existing attributes and their values, select an attribute and click the **Edit** button.

   Step Result: In either case, this opens a **Profiling Attribute** configuration dialog box where you can define attributes that exist in your schema.

Figure 179. Profiling Attribute Dialog Box



The following options are available in this dialog box:

Document type

Select the document type (*framework (on page 3420)*).

> **Tip:**
> You can use the `*` or `?` wildcards in this combo box. For example, `DITA*` would match any document type that starts with *"DITA"*. You can also specify multiple document types by using commas to separate them.

Attribute name

The name of the profiling attribute.

Display name

This optional field is used for descriptive rendering in profiling dialog boxes.

Attribute Values Table

This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (**New**, **Edit**, **Delete**).

The columns are as follows:

- **Value** - The attribute value.
- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in **Author** mode (**Edit Profiling Attributes** dialog box *(on page 684)*, **Condition Set** dialog box *(on page 686)*, and other UI components where the profiling is shown *(on page 691)*). If the **Label** is not specified, the **Value** will be used as its rendered name.
- **Description** - A description for the attribute value that will be displayed in this table.

Single value

Select this option if you want the attribute to only accept a single value.

Multiple values separated by

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between *space*, *comma*, and *semicolon*, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

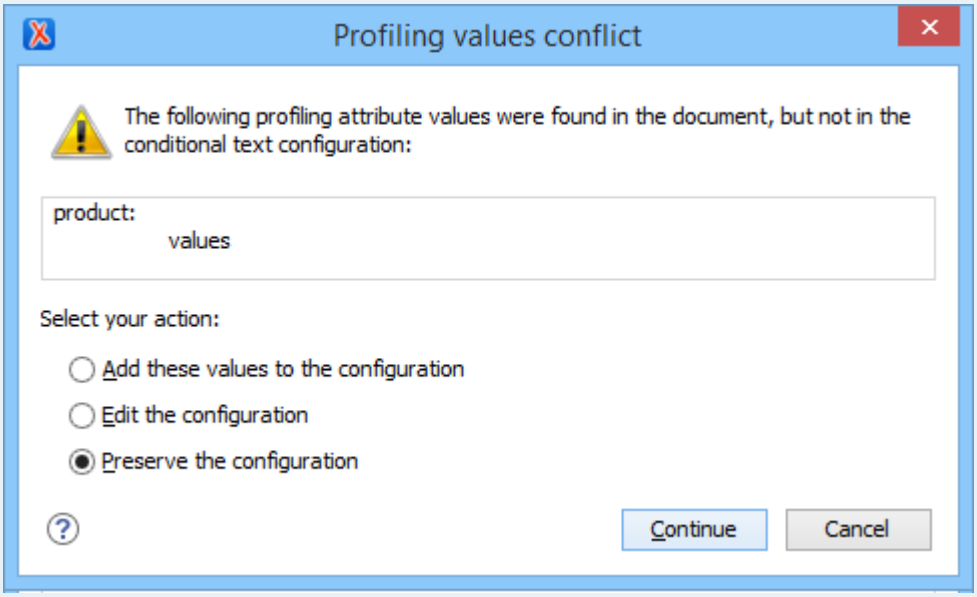
4. After defining or configuring the attributes and their values according to your needs, click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.
5. Click **Apply** to save the changes.

Adding Profiling Attribute Values Directly in a Document

You can add values directly to the existing profiling attributes in a document using the In-Place Attributes Editor *(on page 619)* in **Author** mode, the **Attributes** view *(on page 638)*, or in the source code in **Text** mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the **Edit Profiling Attributes** action (from the contextual menu in **Author** mode) on the new value, the **Profiling Values Conflict** dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the **Attributes and Condition Sets** preferences page *(on page 195)* where you can edit the profiling configuration.

Note:
If the **Allow contributing extra profiling attribute values** option *(on page 197)* is not selected in the **Attributes and Condition Sets** preferences page, the **Profiling Values Conflict** dialog box will never appear, so this automatically adding value not be possible.

Figure 180. Profiling Values Conflict Dialog Box



Sharing Profiling Attribute Configurations

Your profiling configuration can be shared with other users through a project file. If you select **Project Options** *(on page 3423)* at the bottom of the **Profiling/Conditional Text** preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see Sharing a Project - Team Collaboration *(on page 425)*.

Related Information:

Applying Profiling Attributes *(on page 684)*
Creating and Editing Profiling Condition Sets *(on page 686)*
Applying Profiling Condition Sets *(on page 688)*
Showing and Filtering Profiled Content in Author Mode *(on page 691)*

Applying Profiling Attributes

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

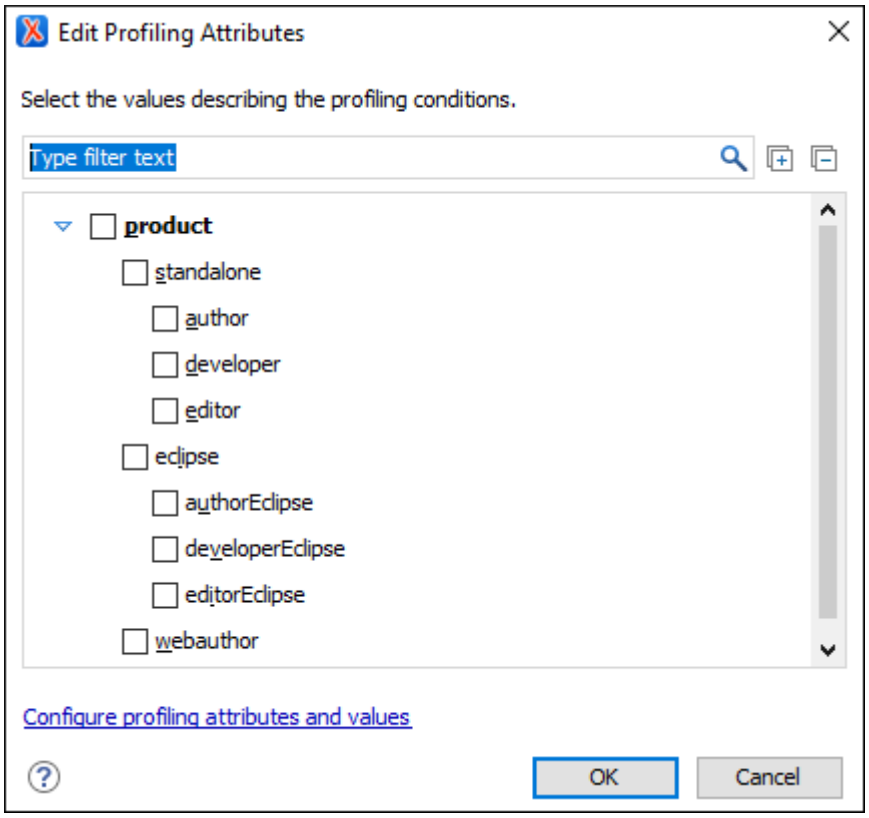
To apply a profiling attribute to content in **Author** mode, follow these steps:

1. To apply a profiling attribute to content in **Author** mode, highlight the content and select **Edit Profiling Attributes** from the contextual menu. To profile an entire element, position the cursor inside the element, right-click, and select **Edit Profiling Attributes** (you can also right-click the element in the *breadcrumb (on page 612)* or **Outline** *(on page 549)* view).

   Step Result: The **Edit Profiling Attributes** dialog box is displayed and shows all the profiling attributes and their values, as defined for the particular document type (*framework*). If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **Expand All** / **Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

   The attributes and values that appear in the dialog box are determined as follows:
   - If you have defined profiling attribute values *(on page 681)* for the DITA document type in the **Attributes and Condition Sets** preferences page *(on page 195)* and you store them at project-level *(on page 3423)*, those values are displayed in the dialog box.
   - If you have defined profiling attribute values *(on page 681)* for the DITA document type in the **Attributes and Condition Sets** preferences page *(on page 195)* and you store them at global-level *(on page 3420)*, those values are displayed in the dialog box.
   - Otherwise, a generic default set of profiling attributes and values are available.

   Figure 181. Edit Profiling Attributes Dialog Box



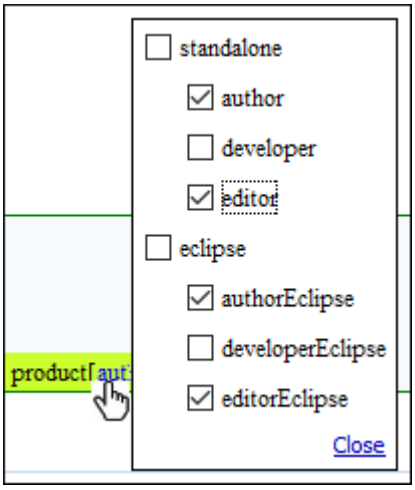
2. In the **Edit Profiling Attributes** dialog box, select the checkboxes that correspond to the attribute values you want to apply on the *document fragment (on page 3419)*.

3. Click **OK** to finish the profiling configuration.

Result: The attribute names and values selected in the **Edit Profiling Attributes** dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements where the profiling attributes are set.

If the **Show Profiling Attributes** option *(on page 691)* (available in the **Profiling / Conditional Text** toolbar menu) is selected, a green border is painted around profiled text in the **Author** mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 182. Profiling Attribute Value Form Control Pop Up



Related Information:

Creating and Editing Profiling Attributes *(on page 681)*
Creating and Editing Profiling Condition Sets *(on page 686)*
Applying Profiling Condition Sets *(on page 688)*
Showing and Filtering Profiled Content in Author Mode *(on page 691)*
Customizing Colors and Styles for Rendering Profiling in Author Mode *(on page 3333)*

Creating and Editing Profiling Condition Sets

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. A *Profiling Condition Set* is a very powerful and convenient tool that can be used to preview the content that goes into the published output. For example, an installation manual available in both Windows and Linux variants can be profiled to highlight only the Linux procedures for more advanced users.

Create Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Attributes and Condition Sets**.

   Information:
   The **Profiling Condition Sets** section *(on page 197)* is used to define condition sets.

2. To add new condition set, click the **New** button at the bottom of the **Profiling Condition Sets** table. To customize existing condition sets, select an existing condition set and click the **Edit** button.

   Step Result: In either case, this opens a **Condition Set** configuration dialog box where you can define attributes that exist in your schema.

   Figure 183. Condition Set Configuration Dialog Box

   The following options are available in this dialog box:

   Name

   The name of the new condition set.

   Document type

Select the document type (*framework (on page 3420)*) that has profiling attributes defined.

Use DITAVAL file

For DITA projects, select this option if you want the *Profiling Condition Set* to reference a DITAVAL file *(on page 3342)*. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.

Include the content matching the following conditions

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the **filter** text field to search for specific conditions.

Shortcut key

You can click the **Choose** button to open a dialog box that allows you to define a shortcut key for this particular condition set. You can then use that shortcut key anytime you want to select this condition set to filter content.

3. After defining or configuring the condition sets according to your needs, click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
4. Click **Apply** to save the condition set.

Sharing Condition Set Configurations

Your condition set configuration can be shared with other users through a project file. If you select **Project Options** *(on page 3423)* at the bottom of the **Profiling/Conditional Text** preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see Sharing a Project - Team Collaboration *(on page 425)*.

Related Information:

Applying Profiling Condition Sets *(on page 688)*
Creating and Editing Profiling Attributes *(on page 681)*
Applying Profiling Attributes *(on page 684)*
Showing and Filtering Profiled Content in Author Mode *(on page 691)*
Customizing Colors and Styles for Rendering Profiling in Author Mode *(on page 3333)*

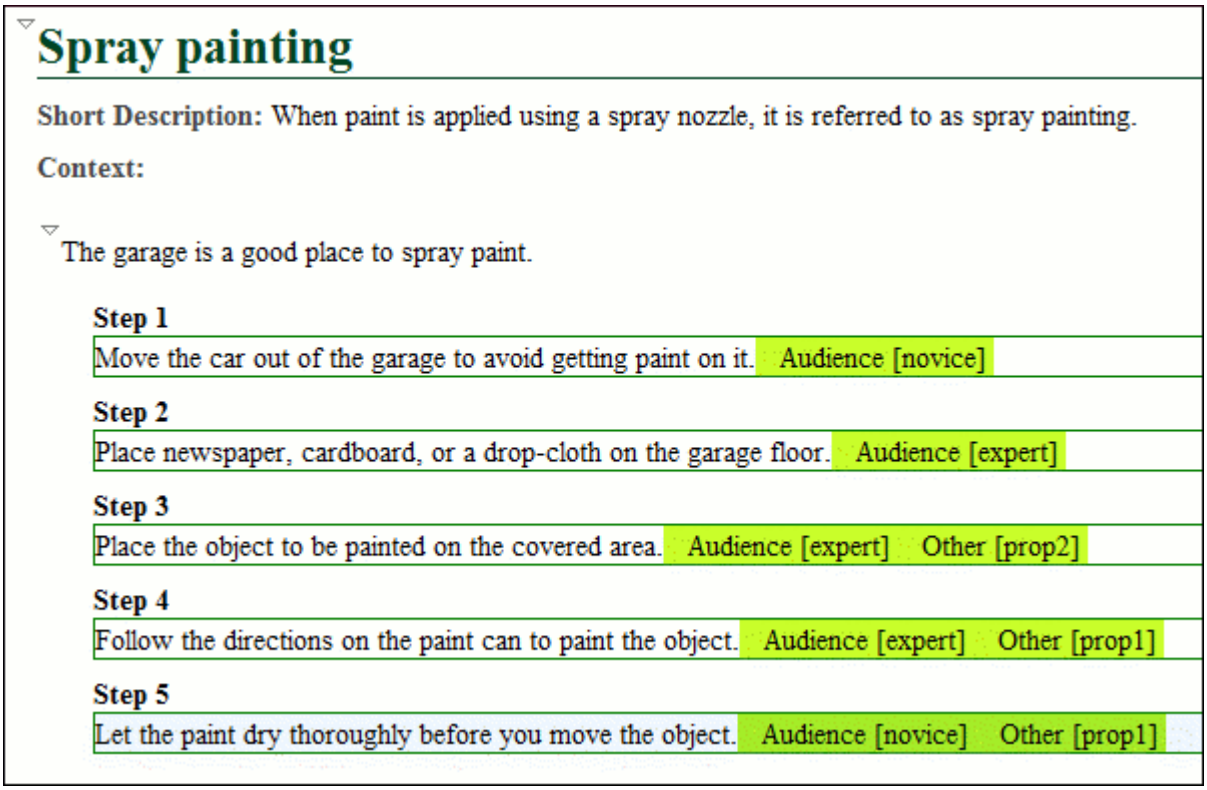
Applying Profiling Condition Sets

All defined Profiling Condition Sets *(on page 686)* are available as shortcuts in the **Profiling / Conditional Text** toolbar menu *(on page 691)*. Select a menu entry to apply the condition set. The filtered content is then

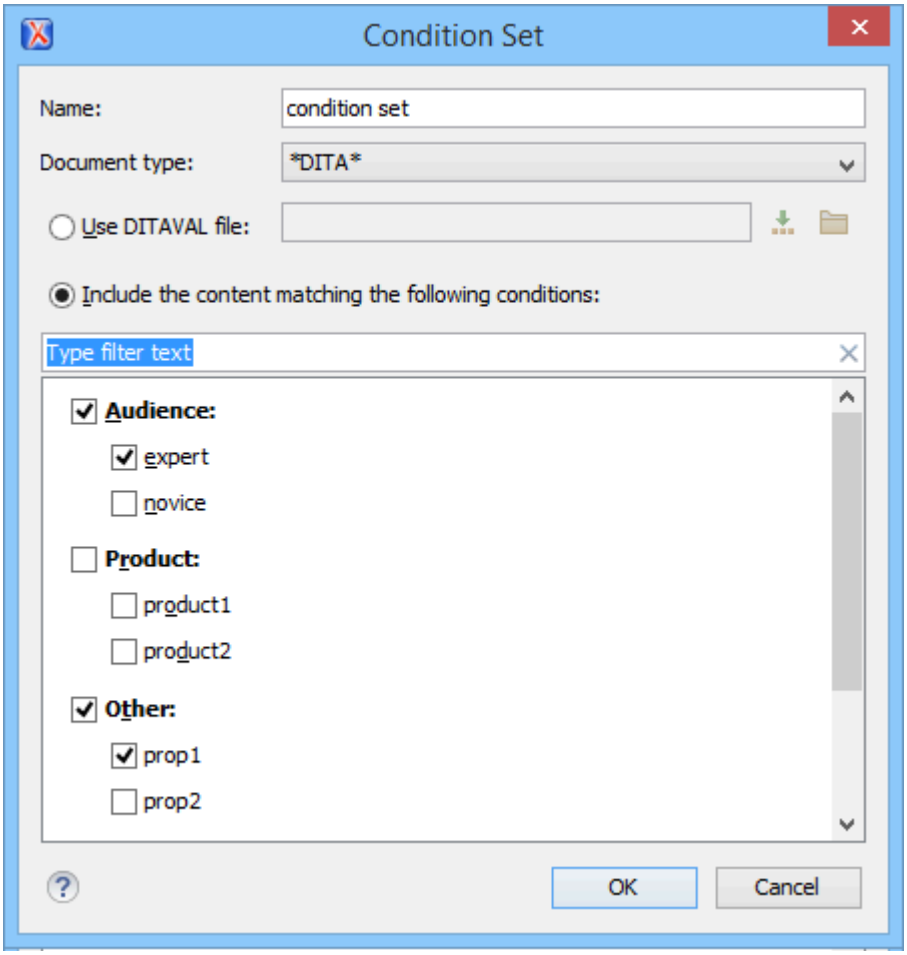
grayed-out in the **Author** mode and **Outline** view *(on page 549)*. An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the values covered by the condition set.

EXAMPLE:

Suppose that you have the following document:



If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the `expert` value for the `@audience` attribute and content that has the *prop1* value for the `@other` attribute.



This is how the document looks in **Author** mode after you apply the condition set:

Showing and Filtering Profiled Content in Author Mode *(on page 691)*
Customizing Colors and Styles for Rendering Profiling in Author Mode *(on page 693)*

Showing and Filtering Profiled Content in Author Mode

You can visualize the effects of profiled content in **Author** mode by using the options in the  **Profiling/Conditional Text** drop-down menu that is located on toolbar. This drop-down menu includes the following filtering options:

Show Profiling Colors and Styles

Select this option to show colors and styles for profiled content in **Author** mode. You can configure the colors and styles or specify whether or not this option is selected by default in the **Profiling/Conditional Text > Colors and Styles** preferences page *(on page 197)*.

Show Profiling Attributes

Select this option to display the values of the profiling attributes at the end of profiled content in **Author** mode. You can specify whether or not this option is selected by default in the **Profiling/Conditional Text** preferences page *(on page 195)*.

Show Excluded Content

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in **Author** mode and the **Outline** *(on page 549)* view. When this option is selected and a condition set is selected in this drop-down menu *(on page 691)*, the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu *(on page 691)*, the filtered content is hidden. You can specify whether or not this option is selected by default in the **Profiling/Conditional Text** preferences page *(on page 195)*.

Choose Condition Set (Available if more than 15 condition sets are defined)

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

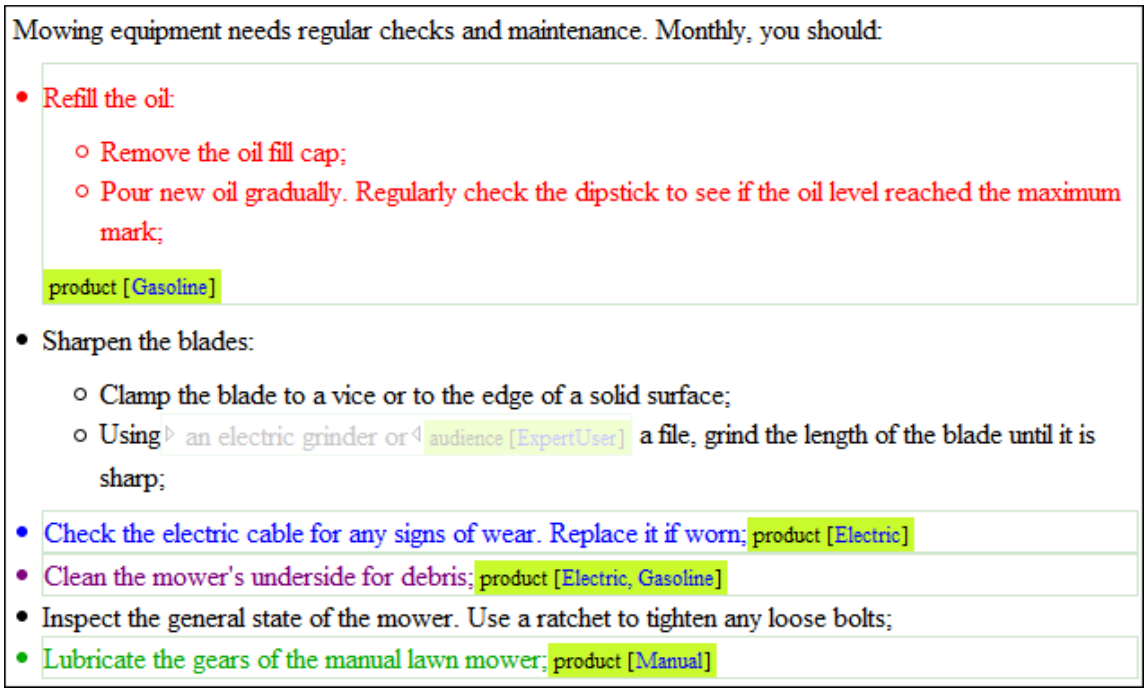
List of Defined Condition Sets

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in **Author** mode to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the **More** submenu or by using the **Choose Condition Set** option *(on page 691)* to access a dialog box that presents all of them.

Profiling Settings

Opens the **Attributes and Condition Sets** preferences page *(on page 195)* where you can add and edit profiling attributes and condition sets.

Figure 184. Example: Profiling Controls in Author Mode



If the **Show Profiling Attributes** option is selected, a green border is painted around profiled text in the **Author** mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 185. Profiling Attribute Value Form Control Pop Up

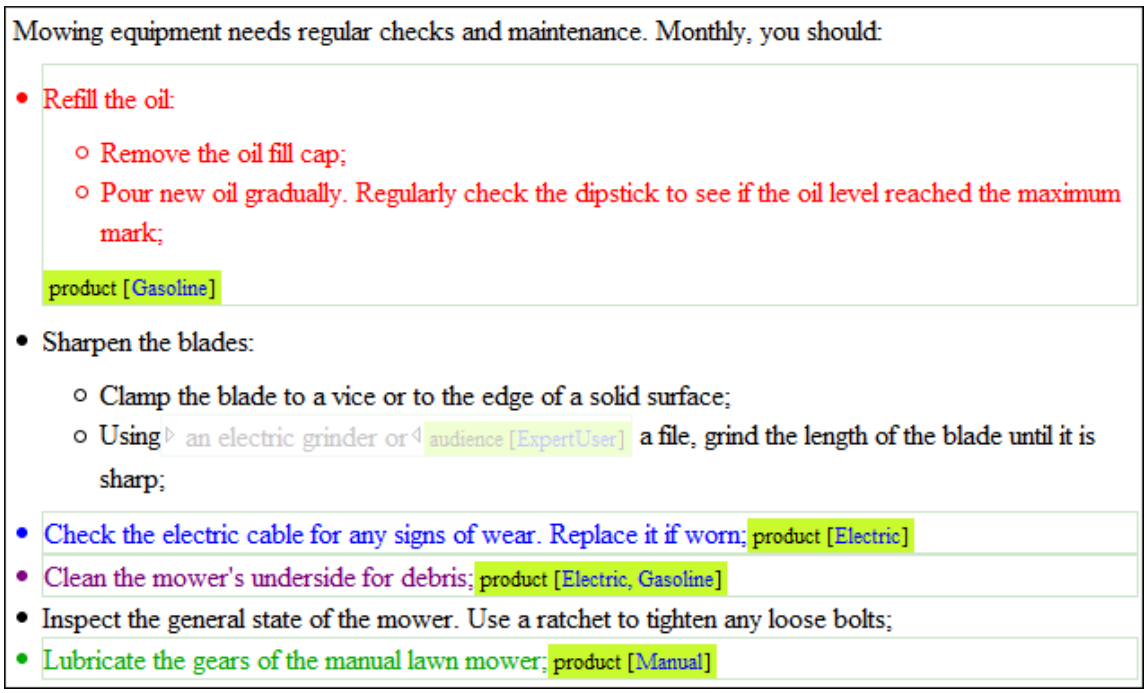
Creating and Editing Profiling Condition Sets *(on page 686)*

Applying Profiling Condition Sets *(on page 688)*
Customizing Colors and Styles for Rendering Profiling in Author Mode *(on page 693)*

Customizing Colors and Styles for Rendering Profiling in Author Mode

In **Author** mode, profiling colors and styles can be applied to mark profiled content. This enables the user to distinguish between multiple variants of the output and preview the content that will be published. The excluded text is grayed-out or hidden, making it easy to identify the differences.

Figure 186. Example: Profiling Colors and Styles in Author Mode



Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

Styling Profiling Attribute Values

To set colors and styles for profiling attribute values, follow these steps:

1. Select the **Show Profiling Colors and Styles** option *(on page 691)* from the **Profiling / Conditional Text** toolbar drop-down menu.
2. Select **Profiling Settings** *(on page 691)* from the **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Attributes and Condition Sets** preferences page *(on page 195)*.

3. Go to the **Colors and Styles** preferences page *(on page 197)* to configure the colors and styling for the profiling attributes.
4. Go to the **Attributes** preferences page *(on page 199)* to configure how you want the profiling attributes to appear in Oxygen XML Editor.

Result: The styling is now applied in the **Author** editing mode and the **Outline** view *(on page 549)*. Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the **Edit Profiling Attributes** dialog box *(on page 681)* and in the inline form control pop-up that allows you to quickly set the profiling attributes.

Adding Tables in Author Mode

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in various *frameworks (on page 3420)* (DITA, DocBook, TEI, and XHTML). This opens the **Insert Table** dialog box. Each *framework* has a different set of options that are available in this dialog box for configuring the properties of the tables. In all cases, Oxygen XML Editor includes some general editing actions for configuring tables in **Author** mode.

This section explains those general actions and the various configuration options and layouts for tables that are inserted in the most commonly used document types.

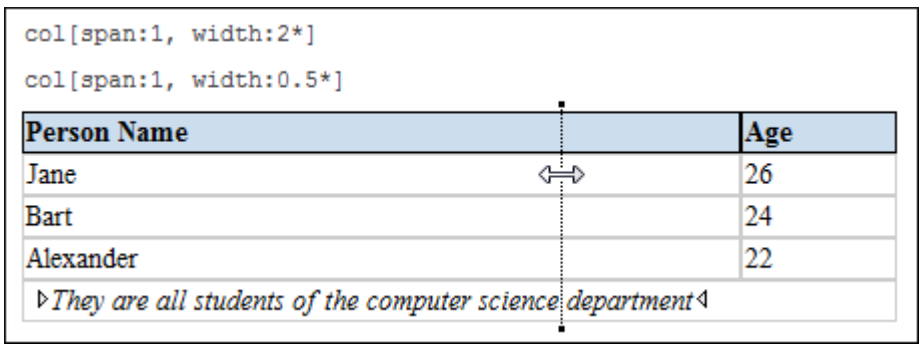
Editing Tables in Author Mode

Oxygen XML Editor provides support for editing data in a tabular form. A variety of features and operations are available for editing tables in **Author** mode and they include the following:

Adjusting Column Width

To adjust the width of a column or table, drag the border of the column or table. The changes you make to a table are committed into the source document. You can also manage table width and column width specifications from the source document, and some types of tables include a **colspecs** section that appears above the table in **Author** mode that allows you to easily configure some column specifications (such as column width). These column width specifications are supported in fixed, dynamic, and proportional dimensions. The built-in DITA, DocBook, and XHTML *frameworks (on page 3420)* support this feature. The layout of the tables for these document types takes into account the table width and the column width specifications particular to them.

Figure 188. Resizing a Table Column in Author Mode



Selecting Columns and Rows

To select a row or a column of a table, place the mouse cursor above the column or in front of the row you want to select, then click. When hovering the mouse cursor in front of rows or above column headers, the cursor changes to for row selection and to for column selection and that specific row or column is highlighted.

You can use the **Ctrl** and **Shift** keys to select multiple rows.

Selecting Cells

To select a cell in a table, press and hold the **Ctrl** key and click anywhere inside the cell. You can also use the **Ctrl** and **Shift** keys to select multiple cells or to deselect cells from a selection. Alternatively, you can click the left corner of a cell (right corner if you are editing an RTL document *(on page 764)*) to select it. The cursor changes to when you hover over the corner of the cell.

You can also select multiple rectangular blocks of cells by using your mouse to select a cell and drag it to expand the selection.

Drag and Drop

You can use the drag and drop action to edit the content of a table. You can select a column and drag it to another location in the table you are editing. When you drag a column and hover the cursor over a valid drop position, Oxygen XML Editor decorates the target location with bold rectangles. The same drag and drop action is also available for entire rows or columns by hovering the mouse cursor in front of rows or above column headers, then selecting the row or column and dragging them to the desired location.

Copy/Cut and Paste

In Oxygen XML Editor, you can copy/cut entire rows or columns of the table you are editing and paste the copied columns or rows inside the same table or inside other tables. You can also use the copy or cut actions for tables located in other documents. If you paste a row or column into non-table content, Oxygen XML Editor introduces a new table that contains the fragments of the copied row or column content.

For copied columns, the fragments are introduced starting with the header of the column. Also, if the copied column is from a *CALS* table (DITA or DocBook), Oxygen XML Editor preserves column width information. This information is then used when you paste the column into another *CALS* table.

For copied cells, when pasting them into another cell without a selection (the cursor is just placed in the new cell), the copied cells are pasted while preserving their initial order and spacing. If pasting them into a selection of cells, first the content of the selected cells is deleted, then the copied cells are pasted with their initial order and spacing preserved and if there are more cells in the selection than in the copied content, the pasting will repeat the copied cells until the end of the selection.

Deleting Content

To delete the content of a cell, select the cell and press the **Delete** or **Backspace** key on your keyboard. If you press **Delete** or **Backspace** again, the selected table structure will also be removed.

To delete an entire row or column, place the cursor inside the row or column (or select it) and use the  **Delete Row(s)** or  **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for the current row or column.

To delete a selection of multiple rows or columns, select them and use the  **Delete Row(s)** or  **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for all rows or columns that exist in the current selection.

Navigating Cells

Along with the normal mouse navigation, you can also navigate between cells by using the arrow keys on your keyboard. By default, when using the arrow keys to navigate between table cells, the cursor jumps from one cell to another. However, if the **Quick navigation in tables** option *(on page 187)* is not selected in the **Cursor Navigation** preferences page, using the arrow keys to navigate between table cells will cause the cursor to navigate between XML nodes, rather than jumping from cell to cell.

Related information

Adding Tables in DocBook *(on page 697)*
Adding Tables in DITA Topics *(on page 3165)*
Adding Tables in XHTML Documents *(on page 721)*
Sample Plugin: Add CALS Support for any XML Document

Adding Tables in DocBook

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a DocBook document.

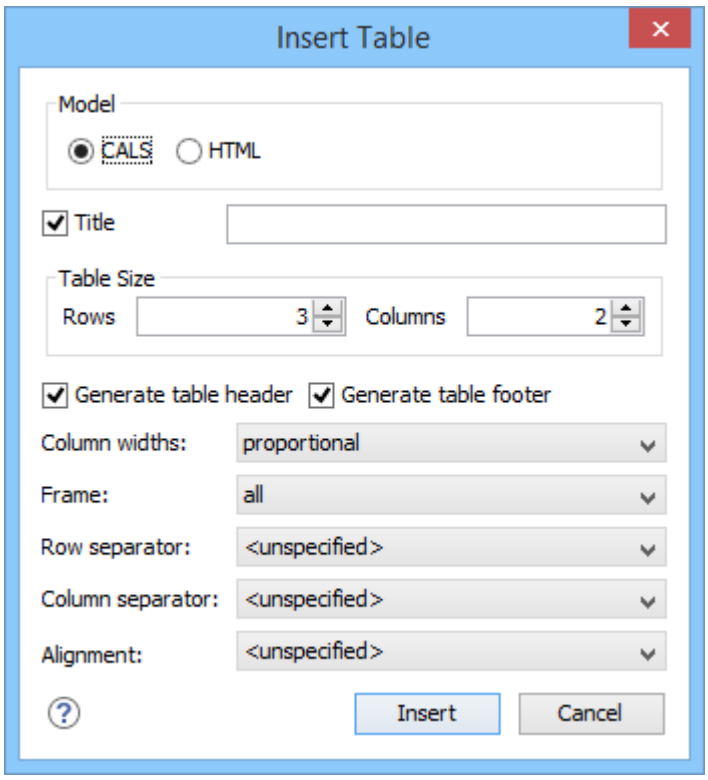
DocBook supports two types of tables:

- **CALS** table model - This is used for more advanced functionality.
- **HTML** table model - This is used for inserting a formal (captioned) HTML table.

Inserting a CALS Table Model in DocBook

To insert a *CALS* table model in DocBook documents, select the **Insert Table** action on the toolbar or from the contextual menu. The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure a few more properties than the *HTML* model.

Figure 189. Insert Table Dialog Box - CALS Model



The dialog box allows you to configure the following options when you select the **CALS** table model:

Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Generate table footer

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

Column widths

Allows you to specify the type of properties for column widths (`@colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@colwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width (`@colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook CALS table specifications.

Row separator

Specifies whether or not to include row separators (`@rowsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

Column separator

Specifies whether or not to include column separators (`@colsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

Alignment

Specifies the alignment of the text within the table (`@align` attribute). The allowed values are:

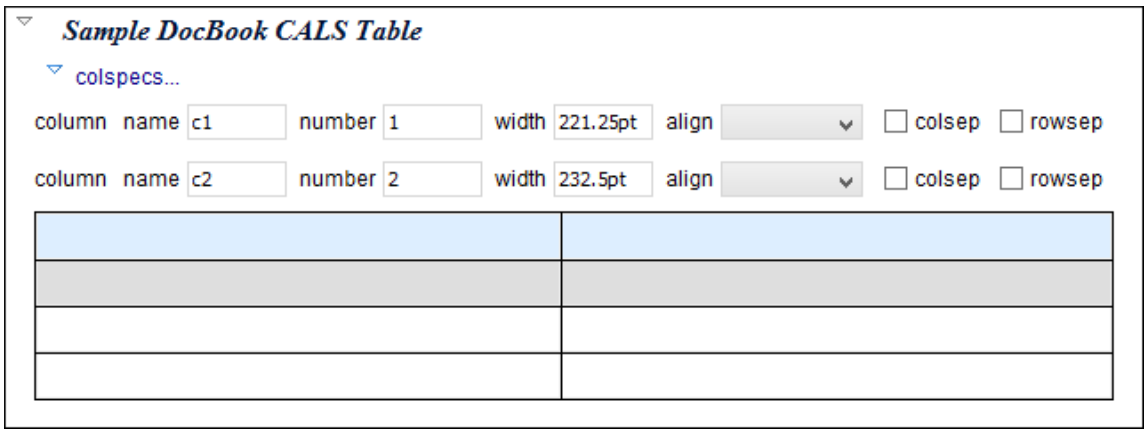
- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

Note:
The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `<colspecs>` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author** mode *(on page 363)*, the *colspecs* link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

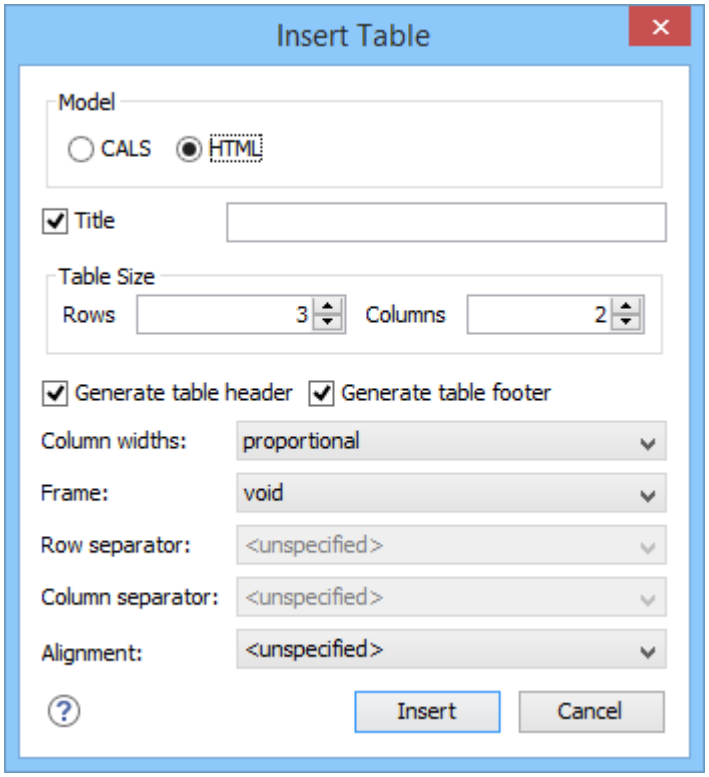
Figure 190. CALS Table in DocBook



Inserting an HTML Table Model

To insert an *HTML* table model in DocBook documents, select the **Insert Table** action on the toolbar or from the contextual menu. The **Insert Table** dialog box appears. Select **HTML** for the table **Model**.

Figure 191. Insert Table Dialog Box - Simple Model



The dialog box allows you to configure the following options when you select the **HTML** table model:

Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Generate table footer

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

Column widths

Allows you to specify the type of properties for column widths (`@width` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@width` attribute (in a `<col>` element) with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `width="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@width` attribute are automatically changed

accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@width` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "0*" (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook HTML table specifications.

Alignment

Specifies the alignment of the text within the table (`@align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

Note:
The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your document at the current cursor position.

When you insert an HTML table, you see a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. Although this section appears as part of the **Author** mode *(on page 363)*, it will not appear in your output. It is just there to make it easier to adjust how the columns of your table are formatted.

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be

used to fine-tune the formatting of your tables by using the **Attributes** view *(on page 638)* (**Window > Show View > Attributes**).

You can also use the **Table Properties (Ctrl + T (Command + T on macOS))** *(on page 3175)* action from the toolbar or contextual menu to modify many of the properties of the table *(on page 704)*.

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text** mode *(on page 362)*.

DocBook Table Layouts

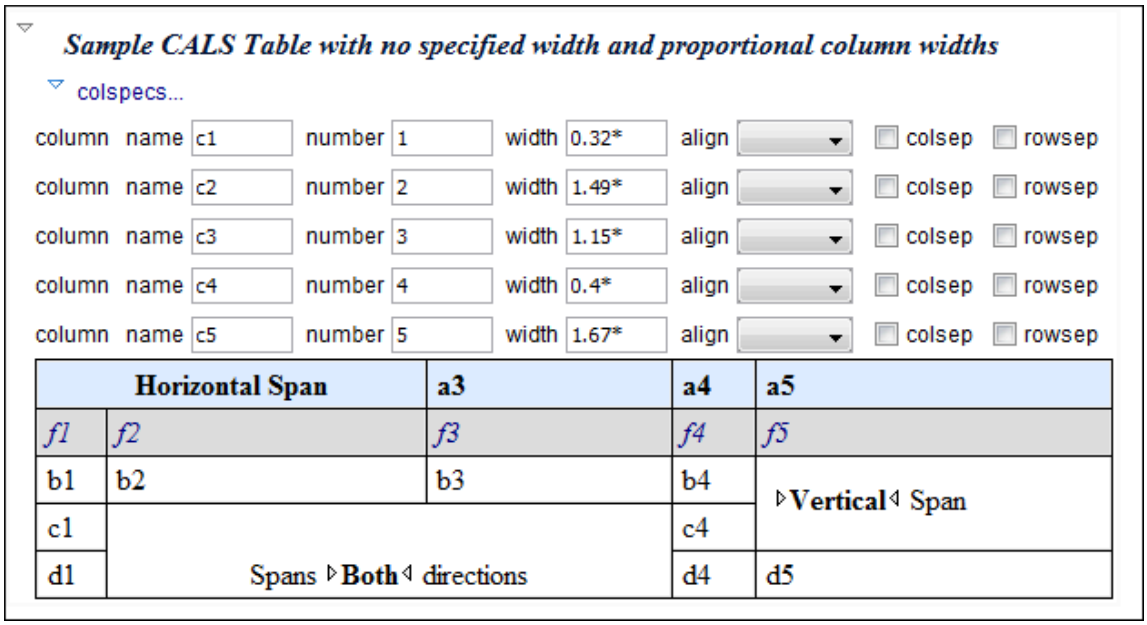
The DocBook *framework (on page 3420)* supports the following two table model layouts:

- *CALS* table model *(on page 702)*
- *HTML* table model *(on page 703)*

CALS Table Model Layout

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`@colwidth` attribute) or the text alignment (`@align` attribute). Although they appear as part of the **Author** mode *(on page 363)*, the *colspecs* link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 192. CALS Table in DocBook

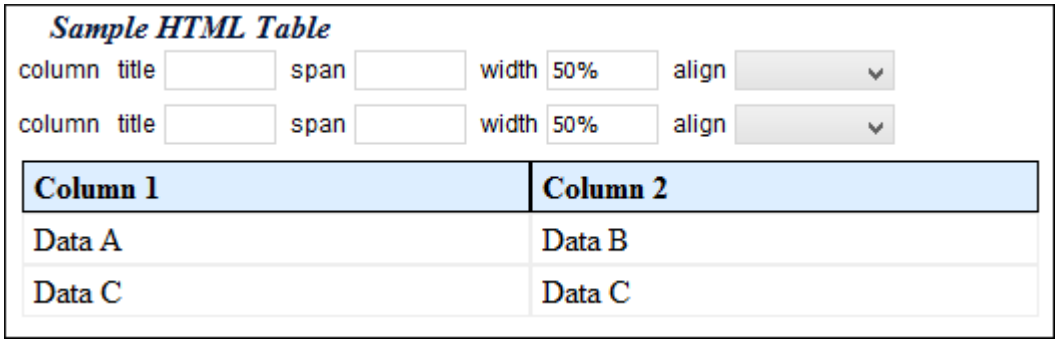


Tip:
A sample plugin is available that can be used as inspiration to add support for CALS tables in any XML document: Sample Plugin: Add CALS Support for any XML Document.

HTML Table Model Layout

Choosing an **HTML** table model from the **Insert Table** dialog box in a DocBook document inserts a formal (captioned) HTML table. The layout of an *HTML* table includes a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`@width` attribute) or the text alignment (`@align` attribute). Although these properties appear as part of the **Author** mode *(on page 363)*, they will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 193. HTML Table in DocBook



Pasting Tables in DocBook

Tables that are pasted into a DocBook file are automatically converted to the *CALS* model. If you want to overwrite this behavior and instruct Oxygen XML Editor to convert them to *HTML* tables, set the `docbook.html.table` parameter to `1`. You can find this parameter in the following stylesheet:

- *`[OXYGEN_INSTALL_DIR]`*`/frameworks/docbook/resources/xhtml2db5Driver.xsl` for DocBook 5
- *`[OXYGEN_INSTALL_DIR]`*`/frameworks/docbook/resources/xhtml2db4Driver.xsl` for DocBook 4

Table Validation in DocBook

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for DocBook table layout problems include:

CALS Tables

- A row has fewer cells than the number of columns detected from the table `@cols` attribute.
- A row has more cells than the number of columns detected from the table `@cols` attribute.
- A cell has a vertical span greater than the available rows count.

- The number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- The number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- The value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- The `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

HTML Tables

- A row has fewer cells than the number of table columns.
- The value of the `@colspan`, `@rowspan`, or `@span` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

Editing Table Properties in DocBook

You can edit the structure of an existing table using the table buttons on the toolbar (or from the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes** view *(on page 638)* (**Window > Show View > Attributes**).

You can use the  **Table Properties (Ctrl + T (Command + T on macOS))** action to modify many of the properties of the table. You can also adjust some of the properties in the specification section above the table.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table where the action was invoked.

Note:
Some properties allow the following special values, depending on the context and the current properties or values:

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

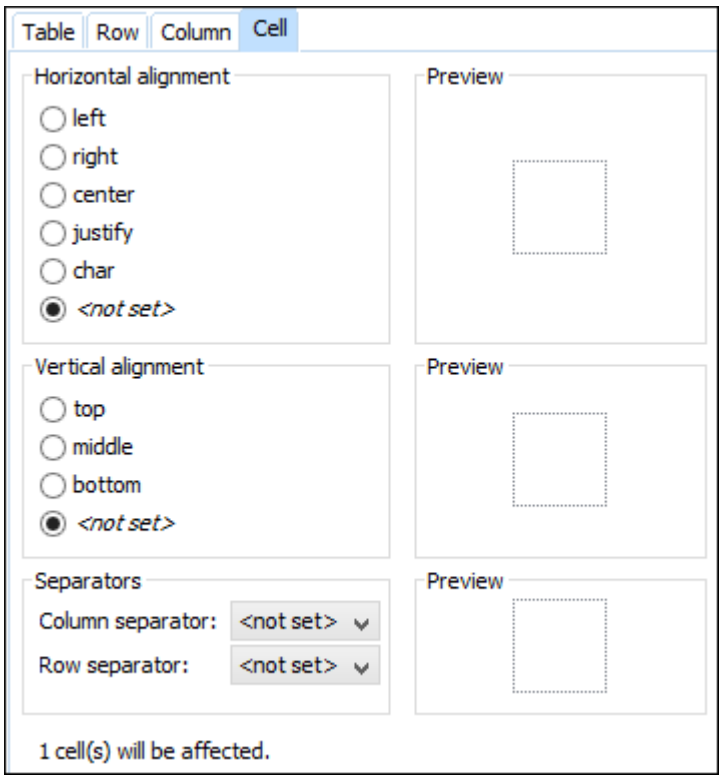
For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.

- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

Figure 194. Table Properties Dialog Box with Cell Tab Selected (DocBook CALS Table Model)



The options in the four tabs include the following:

Horizontal alignment (Available in the Table, Column, and Cell tabs)

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`@align` attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

Vertical alignment (Available in the Row and Cell tabs)

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (`@valign` attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.

Column separator (Available in the Table, Column, and Cell tabs)

Specifies whether or not to include column separators (borders/grid lines) in the form of the `@colsep` attribute. The allowed values are: `0` (no separator) and `1` (include separators).

Row separator (Available in all four tabs)

Specifies whether or not to include row separators (borders/grid lines) in the form of the `@rowsep` attribute. The allowed values are: `0` (no separator) and `1` (include separators).

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook CALS table specifications.

Row type (Available in the Row tab only)

Allows you change the row to a header, body, or footer type of row (within a `@thead`, `@tbody`, or `@tfoot` attribute).

Edit Table Properties for an HTML Table Model

For an **HTML** table model, the **Table properties** dialog box includes four tabs of options (**Table**, **Row**, **Column**, and **Cell**) and the options include a **Preview** pane that shows a representation of the modification.

The options in the four tabs include the following:

Frame (Available only in the Table tab)

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook HTML table specifications.

Row type (Available in the Row tab only)

Allows you change the row to a header, body, or footer type of row (within a `@thead`, `@tbody`, or `@tfoot` attribute).

Horizontal alignment (Available in the Row, Column, and Cell tabs)

Specifies the horizontal alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (`@align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.

- **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

Vertical alignment (Available in the Row, Column, and Cell tabs)

Specifies the vertical alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (`@valign` attribute). The allowed values are:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **baseline** - Sets the row so that all the table data share the same baseline. This often has the same effect as the `bottom` value. However, if the fonts are different sizes, the `baseline` value often makes the table look better.

Related Information:
Editing Tables in Author Mode *(on page 695)*

Adding Tables in DITA Topics

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- DITA *Simple* table model *(on page 3165)* - This is the most commonly used model for basic tables.
- CALS table model (OASIS Exchange Table Model) *(on page 3167)* - This is used for more advanced functionality.
- DITA *Choice* table model *(on page 3169)* - This is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- DITA *Properties* table model *(on page 3171)* - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

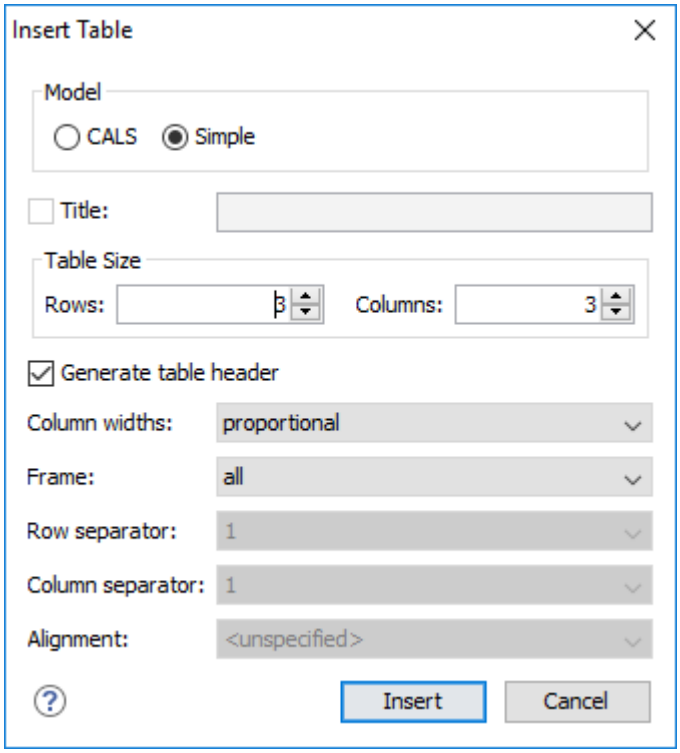
If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

Inserting a Simple Table Model

To insert a **Simple** DITA table, select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

Figure 195. Insert Table Dialog Box - Simple Model



The dialog box allows you to configure the following options when you select the **Simple** table model:

Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`@colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

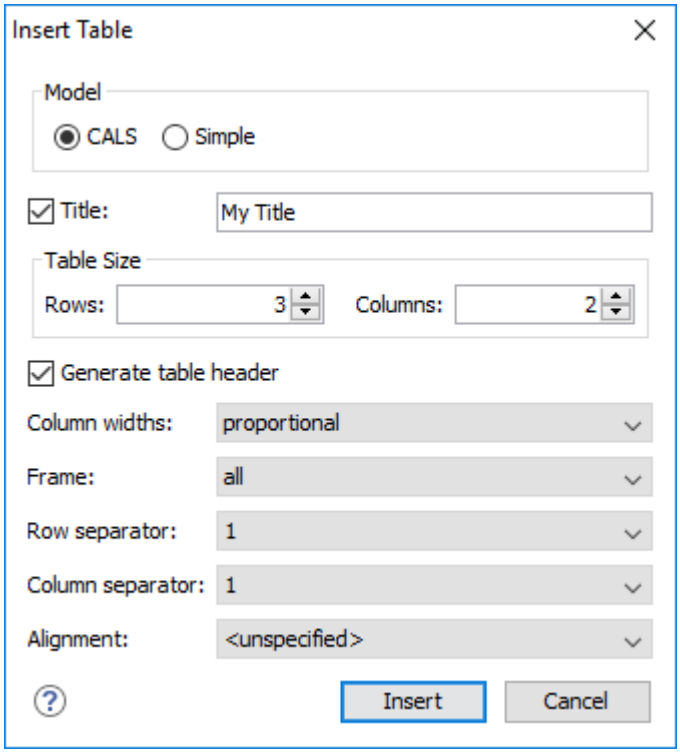
Note:
The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

Inserting a CALS Table Model (OASIS Exchange Table)

To insert an OASIS Exchange Table (**CALS**), select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the *Simple* model.

Figure 196. Insert Table Dialog Box - CALS Model



The dialog box allows you to configure the following options when you select the **CALS** table model:

Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`@colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@colwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width (`@colwidth` attribute). Entering content into a cell changes the rendered width dynamically.

If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Row separator

Specifies whether or not to include row separators (`@rowsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

Column separator

Specifies whether or not to include column separators (`@colsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

Alignment

Specifies the alignment of the text within the table (`@align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note:
The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

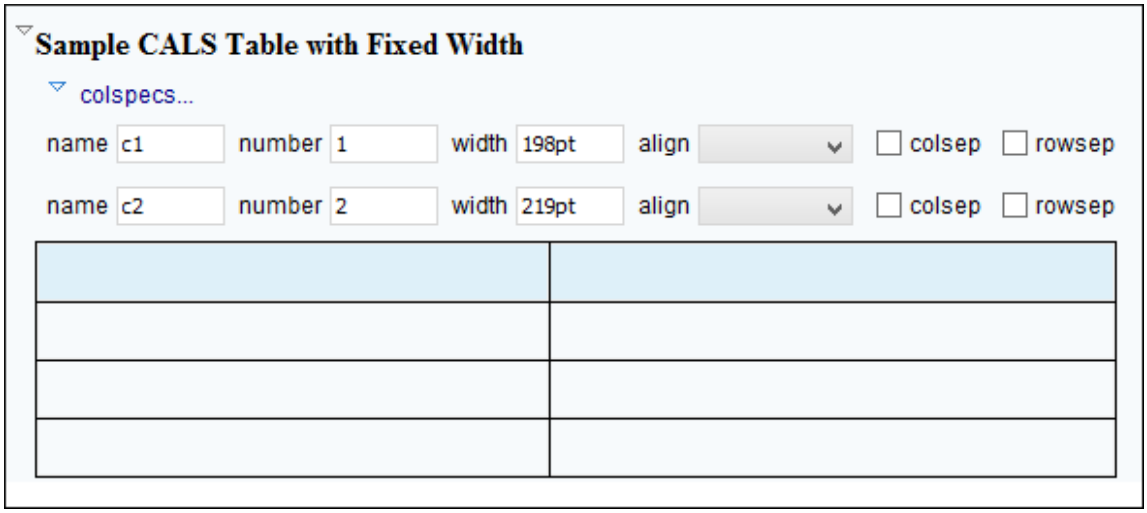
- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Note:
The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the *colspecs* (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author** mode *(on page 363)*, the *colspecs* link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

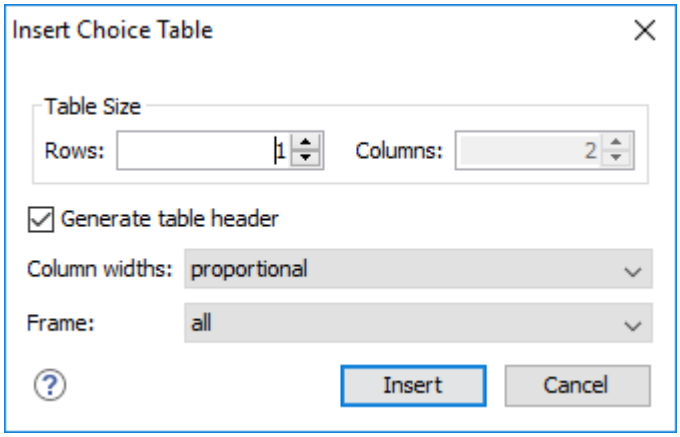
Figure 197. CALS Table in DITA



Inserting a Choice Table Model

To insert a **Choice** table within a `<step>` element in a DITA Task document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **choicetable** from the *Content Completion Assistant (on page 3418)*. The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

Figure 198. Insert Table Dialog Box - Choice Model



The dialog box allows you to configure the following options when you insert a *Choice* table model within a DITA Task:

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`@colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.

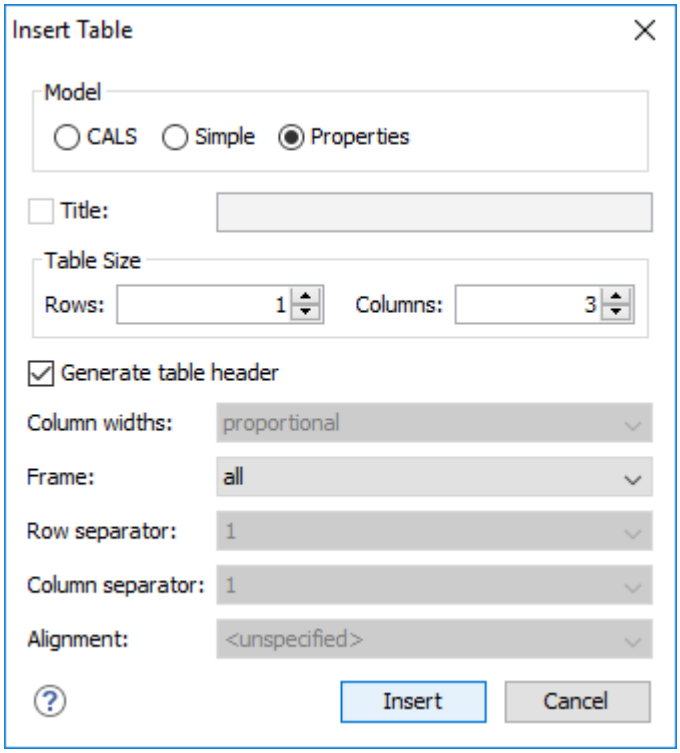
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click **Insert**, a *Choice* table is inserted into your DITA Task document at the current cursor position (within a `<step>` element).

Inserting a Properties Table Model

To insert a **Properties** table within a `<refbody>` element in a DITA Reference document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **properties(wizard)** from the *Content Completion Assistant (on page 3418)*. The **Insert Table** dialog box appears. Select **Properties** for the table **Model**.

Figure 199. Insert Table Dialog Box - Properties Model



The dialog box allows you to configure the following options when you insert a *Properties* table model within a DITA Reference:

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click **Insert**, a *Properties* table is inserted into your DITA Reference document at the current cursor position (within a `<refbody>` element).

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes** view *(on page 638)* (**Window > Show View > Attributes**). See the DITA documentation for a full explanation of these attributes.

You can also use the  **Table Properties (Ctrl + T (Command + T on macOS))** *(on page 3175)* action from the toolbar or contextual menu (or **DITA** menu) to modify many of the properties of the table *(on page 3175)*.

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text** mode *(on page 362)*.

You can use normal copy/paste shortcuts to move content between cells. Oxygen XML Editor includes a *Smart Paste* feature *(on page 623)* that preserves certain style and structure information when pasting content.

Tip:
When copying a multiple selection of table cells and pasting them outside the table, a new table will be created. When pasting into space-preserved elements, the cell content will be pasted as plain text.

Related Information:
Editing Tables in Author Mode *(on page 695)*

DITA Table Layouts

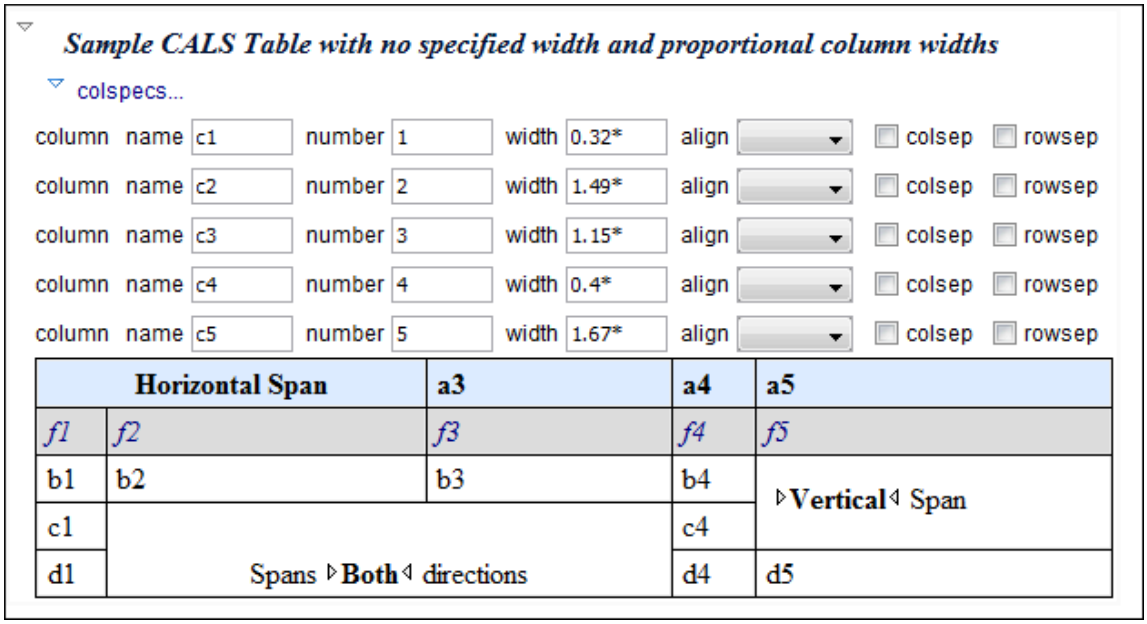
Depending on the context, DITA accepts the following table layouts:

- *CALS* table model *(on page 716)*
- *Simple* table model *(on page 716)*
- *Choice* table model *(on page 717)*
- *Properties* table model *(on page 717)*

CALS Table Model Layout

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`@colwidth` attribute) or the text alignment (`@align` attribute). Although they appear as part of the **Author** mode *(on page 363)*, the *colspecs* link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 200. CALS Table in DITA



Tip:
A sample plugin is available that can be used as inspiration to add support for CALS tables in any XML document: Sample Plugin: Add CALS Support for any XML Document.

Simple Table Model Layout

When choosing a **Simple** table model from the **Insert Table** dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and

choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Figure 201. DITA Simple Table

Header 1	Header 2
Column 1	Column 2

Choice Table Model Layout

A **Choice** table model is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The `<choicetable>` element is a useful device for documenting options within a single step of a task. You can insert *Choice* tables in DITA Task documents either by selecting **choicetable** from the *Content Completion Assistant (on page 3418)* (within a `<step>` element) or by using the **Insert Table** action on the toolbar or from the contextual menu). The options and layout of a *Choice* table is similar to the *Simple* table model.

Figure 202. DITA Choice Table

Option	Description
Opt A	
Opt B	
Opt C	

Properties Table Model Layout

A **Properties** table model is used within a `<refbody>` element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert *Properties* tables in DITA Reference documents either by selecting **properties(wizard)** from the *Content Completion Assistant (on page 3418)* (within a `<refbody>` element) or by using the **Insert Table** action on the toolbar (or from the contextual menu) and selecting **Properties** for the **Model**. The layout of a *Properties* table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Figure 203. DITA Properties Table

Property Type	Property Value	Property Description
A	B	C

Table Validation in DITA

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. When you validate a *DITA map (on page 3419)* with the **Validate and Check for Completeness** action, if the **Report table layout problems** option *(on page 3123)* is selected in the **DITA Map Completeness Check** dialog

box, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

CALS Tables

- A row has fewer cells than the number of columns detected from the table `@cols` attribute.
- A row has more cells than the number of columns detected from the table `@cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- The number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- The value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- The `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

Simple or Choice Tables

A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the  **Table Properties (Ctrl + T (Command + T on macOS))** action from the toolbar or the **Table** submenu of the contextual menu (or **DITA** menu). This opens the **Table properties** dialog box.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table where the action was invoked.

Note:
Some properties allow the following special values, depending on the context and the current properties or values:

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

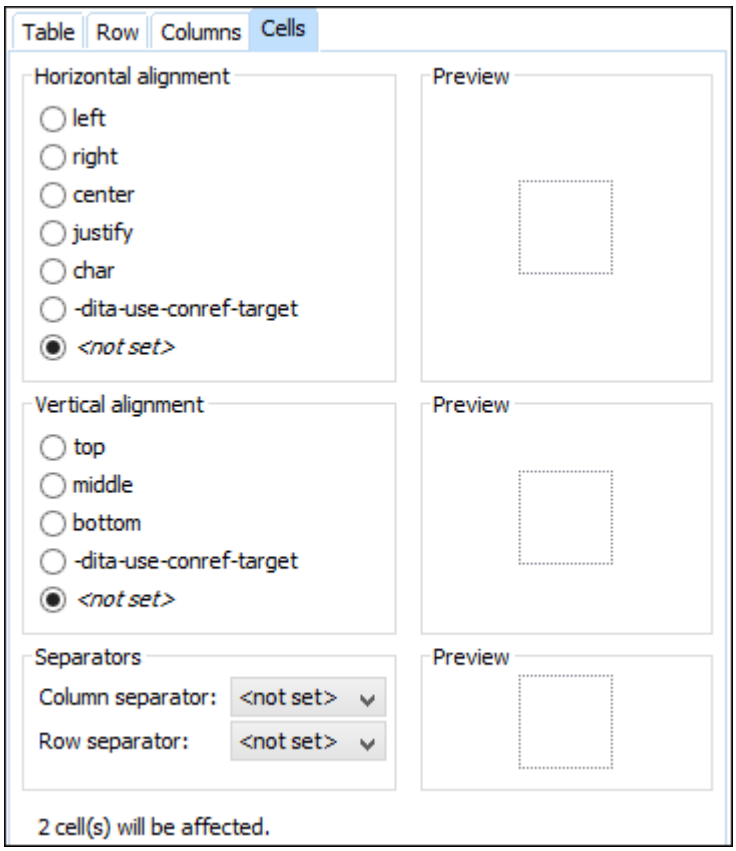
For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.

- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

Figure 204. Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)



The options in the four tabs include the following:

Horizontal alignment (Available in the Table, Column, and Cell tabs)

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`@align` attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

> **Note:**
> The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Vertical alignment (Available in the Row and Cell tabs)

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (`@valign` attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Column separator (Available in the Table, Column, and Cell tabs)

Specifies whether or not to include column separators (borders/grid lines) in the form of the `@colsep` attribute. The allowed values are: `0` (no separator) and `1` (include separators).

Row separator (Available in all four tabs)

Specifies whether or not to include row separators (borders/grid lines) in the form of the `@rowsep` attribute. The allowed values are: `0` (no separator) and `1` (include separators).

Frame (Available only in the Table tab)

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Edit Table Properties for a Simple, Choice, or Properties Table Model

For a *Simple*, *Choice*, *Properties* table model, the **Table properties** dialog box only allows you to edit a few options.

Table tab

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Row tab (not available for *Properties* tables)

Row type

Allows you change the row to a body or header type of row.

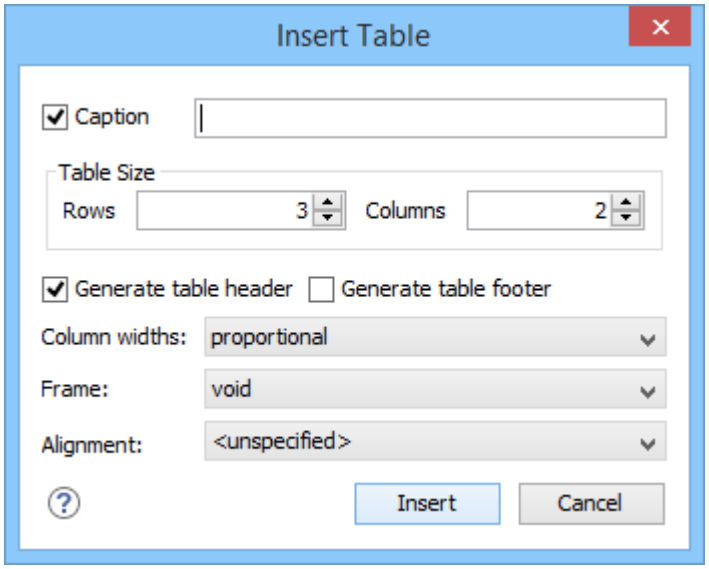
Related Information:

Adding Tables in DITA Topics *(on page 3165)*
Editing Tables in Author Mode *(on page 695)*

Adding Tables in XHTML Documents

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in an XHTML document. This action opens the **Insert Table** dialog box.

Figure 205. Insert Table Dialog Box in XHTML



The dialog box allows you to configure the following options:

Caption

If this checkbox is selected, you can specify a title (caption) for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Generate table footer

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

Column widths

Allows you to specify the type of properties for column widths (`@width` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@width` attribute (in a `<col>` element) with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `width="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@width` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@width` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the

width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "0*" (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in HTML specifications.

Alignment

Specifies the alignment of the text within the table (`@align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

Note:
The options in the **Insert Table** dialog box for XHTML documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your XHTML document at the current cursor position.

When you insert an HTML table, you see a link for setting the `<colspecs>` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author** mode *(on page 363)*, the *colspecs* link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes** view *(on page 638)* (**Window > Show View > Attributes**). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to **Text** mode *(on page 362)*.

XHTML Table Layout

When you insert a table in an XHTML document, an HTML type of table is added. The layout of an *XHTML* table includes a **colspecs** section that allows you to easily configure some properties. For example, you can change the value of column widths (`@width` attribute) or the text alignment (`@align` attribute). Although they appear as part of the **Author** mode *(on page 363)*, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 206. Table Layout in XHTML Documents

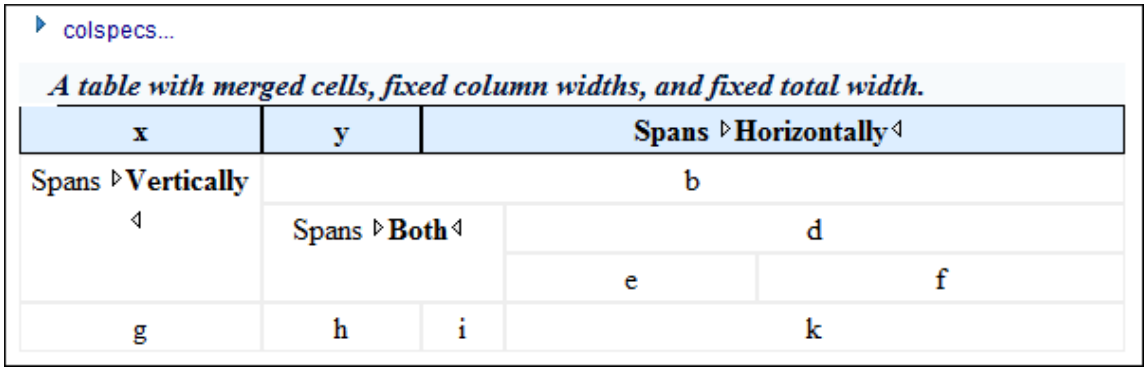


Table Validation in XHTML

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for XHTML table layout problems include:

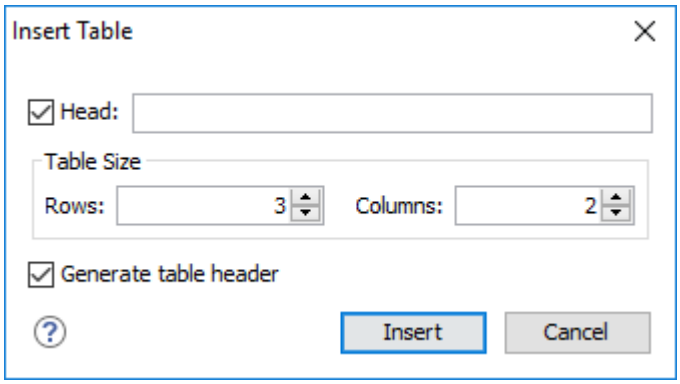
HTML Tables

- A row has fewer cells than the number of table columns.
- The value of the `@colspan`, `@rowspan`, or `@span` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

Adding Tables in TEI Documents

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a TEI document. This action opens the **Insert Table** dialog box.

Figure 207. Insert Table Dialog Box in TEI



The dialog box allows you to configure the following options:

Head

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Note:
The options in the **Insert Table** dialog box for TEI documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your TEI document at the current cursor position.

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes** view *(on page 638)* (**Window > Show View > Attributes**). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to **Text** mode *(on page 362)*.

Adding Tables in JATS Documents

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a JATS document. This action inserts a simple HTML-type table into your document at the current cursor position. Once inserted, you can edit the structure of the table using the table buttons on the toolbar (or in the contextual menu). For example you can add or remove cells, rows, and columns, or split or join cells. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes** view *(on page 638)* (**Window > Show View > Attributes**).

Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to **Text** mode *(on page 362)*.

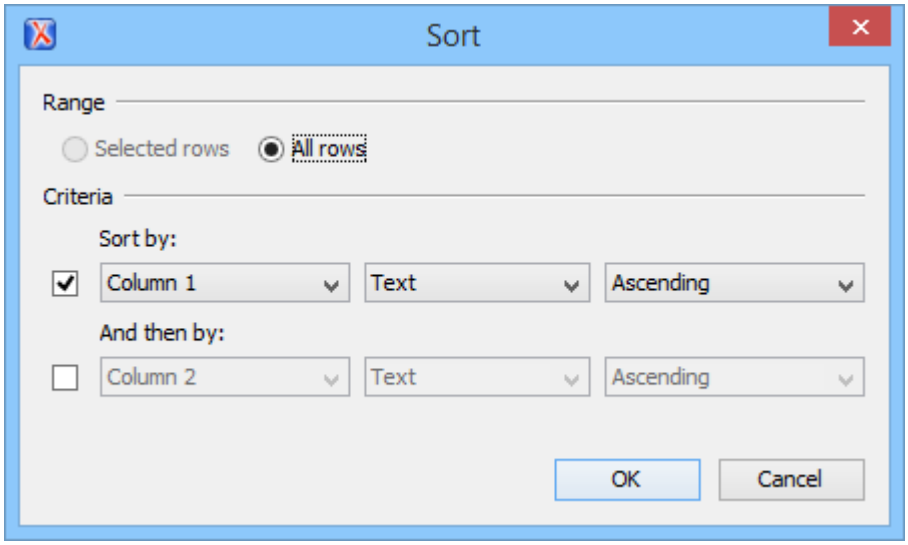
Sorting Content in Tables and List Items

Oxygen XML Editor offers support for sorting the content of tables and list items of ordered and unordered lists.

Sorting a Table

To sort rows in a table, select the entire table (or specific rows) and use the **Sort** action from the main toolbar or the contextual menu. This opens the **Sort** dialog box.

Figure 208. Sort Dialog Box



This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

Note:
When you invoke the sorting operation over an entire table, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

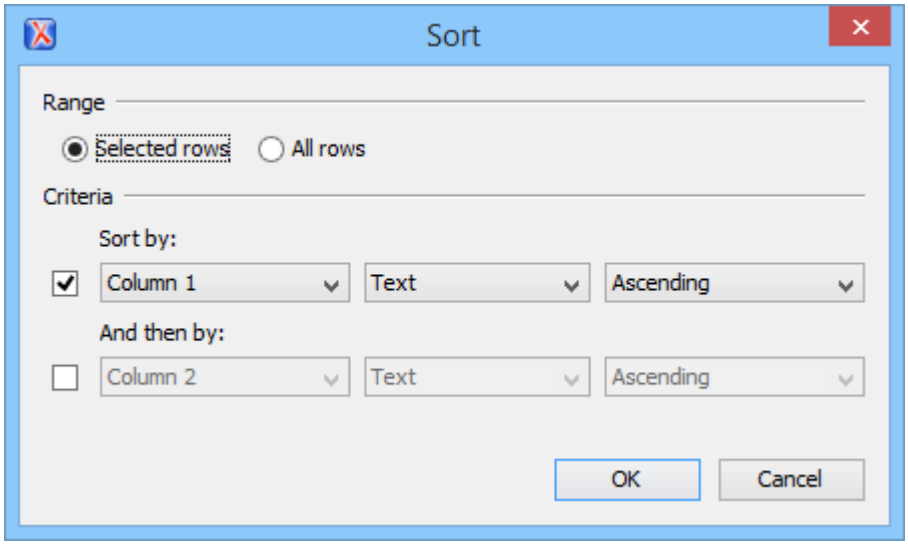
After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on macOS)** on your keyboard.

Note:
The sorting support takes the value of the `@xml:lang` attribute into account and sorts the content in a natural order.

Sorting a Selection of Rows

To sort a selection of rows in a table, select the rows that you want to sort and either right-click the selection and choose **Sort**, or click **Sort** on the main toolbar. This opens the **Sort** dialog box.

Figure 209. Sort Selected Rows



This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

The **Sort** dialog box also allows you to apply the sorting operation to the entire table, using the **All rows** option.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

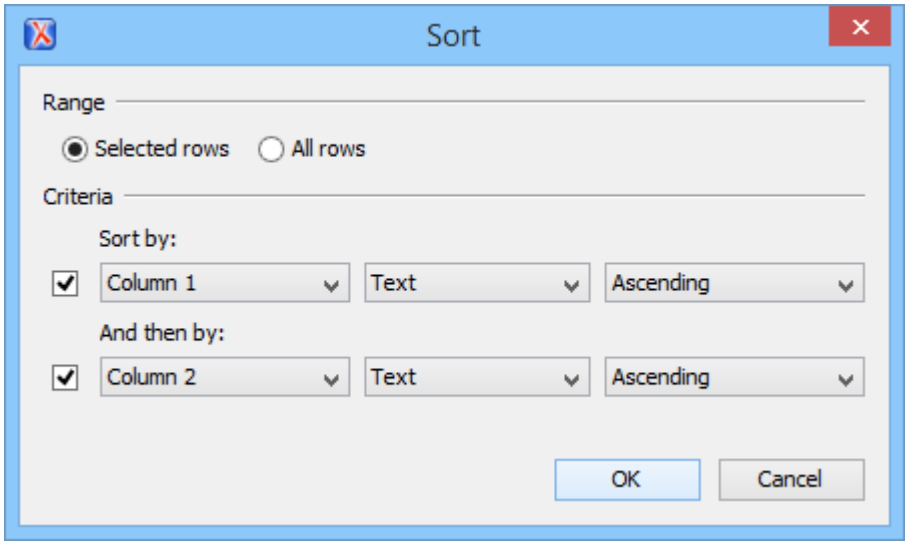
After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on macOS)** on your keyboard.

Note:
The sorting support takes the value of the `@xml:lang` attribute into account and sorts the content in a natural order.

Sort Using Multiple Criteria

You can also sort an entire table or a selection of its rows based on multiple sorting criteria. To do so, select the rest of boxes in the **Criteria** section of the **Sort** dialog box, configure the applicable items, and click **OK** to complete the sorting operation.

Figure 210. Sorting Based on Multiple Criteria



Sorting a Table that Contains Merged Cells

If a table contains cells that span over multiple rows, you can not perform the sorting operation over the entire table. Still, the sorting mechanism works over a selection of rows that do not contain *rowspans*.

Note:
For this type of table, the **Sort** dialog box keeps the **All rows** option disabled even if you perform the sorting operation over a selection of rows.

Sorting List Items

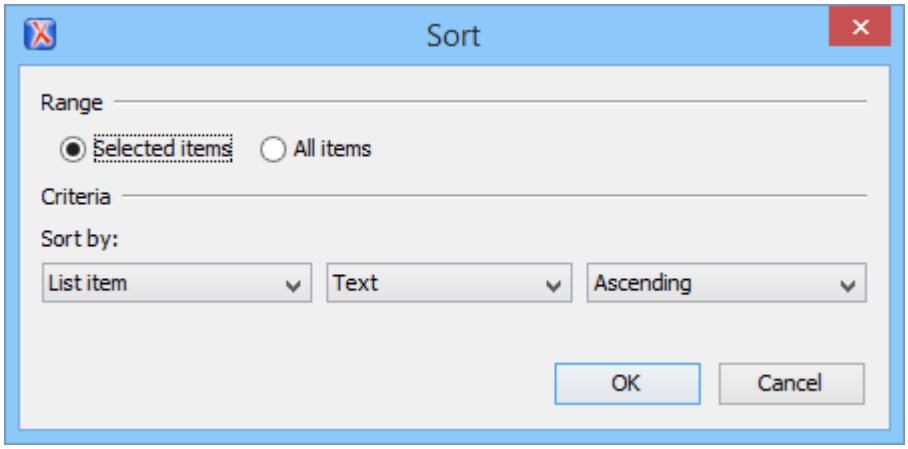
A sorting operation can be performed on various types of lists and list items. The types of lists that can be sorted in Oxygen XML Editor depend on the framework (document type), but examples of the types that can be sorted include:

- Ordered list (DITA, DocBook, XHTML, TEI)
- Unordered list (DITA, DocBook, XHTML, TEI)
- Definition list (DITA)
- Variable list (DocBook)

- Parameter list (DITA)
- Simple list (DITA)
- Required conditions (DITA Machinery Task)
- Supplies list (DITA Machinery Task)
- Spare parts list (DITA Machinery Task)
- Safety conditions (DITA Machinery Task)

The sorting mechanism works on an entire list or on a selection of list items. To sort items in a list, select the items or list and use the **Sort** action from the main toolbar or the contextual menu. This opens the **Sort** dialog box.

Figure 211. Sorting List Items



This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire list or only a selection of its items.

Note:
When you invoke the sorting operation over an entire list, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria, defined by the following:

- The name of the type of item being sorted.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on macOS)** on your keyboard.

Note:
The sorting support takes the value of the `@xml:lang` attribute into account and sorts the content in a natural order.

Inserting Images

To insert an image in a document while editing in **Author** mode, use one of the following methods:

- Click the **Insert Image** action from the toolbar. This opens a dialog box that allows you to choose the image file you want to insert and configure some properties. Oxygen XML Editor tries to reference the image with a path that is relative to that of the document you are currently editing. For example, if you want to add the `file:/C:/project/xml/dir/img1.jpg` image into the `file:/C:/project/xml/doc1.xml` document, Oxygen XML Editor inserts a reference to `dir/img1.jpg`. This is useful when multiple users work on a common project and they have it stored in multiple locations.

  Note:
  The **Insert Image** action is available for the following document types: DITA, DocBook, TEI, XHTML, JATS.

- Drag an image from other application and drop it in the **Author** editing mode. If it is an image file, it is inserted as a reference to the image file. For example, in a DITA topic the path of the image file is inserted as the value of the `@href` attribute in an `<image>` element:

  ```
  <image href="../images/image_file.png"/>
  ```

  Tip:
  To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor will automatically update the reference to the new image.

- Copy an image file from another document or another application (such as a system file browser or web browser) and paste it into your document. Oxygen XML Editor will insert it as a reference to the image file the same as the drag/drop method.
- Select an image (or part of an image) from another application (such as an image editor), copy it, and paste it into your document. Oxygen XML Editor will prompt you to save it. After saving the image, a reference to that file path is inserted at the paste position.

Related Information:

Image Map Editor *(on page 735)*
Image Rendering in **Author** Mode *(on page 731)*
Adding Video, Audio, and Embedded HTML Resources in DITA Topics *(on page 3155)*

Image Rendering in Author Mode

The **Author** mode and the output transformation process might render the images referenced in an XML document differently, since they use different rendering engines.

Table 5. Supported Image Formats

Image Type	Support	Additional Information
GIF	built-in	Animations not yet supported.
JPG, JPEG	built-in	JPEG images with CMYK color profiles *(on page 3053)* are properly rendered only if color profile is inside the image.
PNG	built-in	
SVG, SVGZ	built-in	Rendered using the open-source Apache Batik library that supports SVG 1.1.
BMP	built-in	
TIFF	built-in	Rendered using a part of the Java JAI Image library.
EPS	built-in	Renders the preview TIFF image inside the EPS.
AI	built-in	Renders the preview image inside the Adobe Illustrator file.
PDF	built-in	Rendered by using the bundled Apache PDF Box library.
JPEG 2000, WBMP	plugin	Renders by installing the *Java Advanced Imaging (JAI) Image I/O Tools* plug-in *(on page 733)*.

When an image cannot be rendered, Oxygen XML Editor **Author** mode displays a warning message that contains the reason why this is happening. Possible causes include the following:

- The image is too large. Select the **Show very large images** option *(on page 184)*.
- The image format is not supported by default. It is recommended to install the *Java Advanced Imaging(JAI) Image I/O Tools* plug-in *(on page 733)*.

Tip:

If you are using a custom XML format and you want images to be displayed in **Author** mode, you could use a custom CSS to define the rendering.

For example, if your XML has something like this:

```
<image href="blue.png"/>
```

You can add a selector in your custom CSS like this:

```
image[href]{
    content: attr(href, url);
}
```

Scaling Images

Image dimension and scaling attributes are taken into account when an image is rendered. The following rules apply:

- If you specify only the width attribute of an image, the height of the image is proportionally applied.
- If you specify only the height attribute of an image, the width of the image is proportionally applied.
- If you specify width and height attributes of an image, both of them control the rendered image.
- If you want to scale both the width and height of an image proportionally, use the `@scale` attribute.

Note:
As a Java application, Oxygen XML Editor uses the *Java Advanced Imaging* API that provides a pluggable support for new image types. If you have an *ImageIO* library that supports additional image formats, just copy this library to the *`[OXYGEN_INSTALL_DIR]`*`/lib` directory.

Rendering CGM Images

Oxygen XML Editor offers a few add-ons that provide support for CGM 1.0 images. To allow the rendering of CGM images in **Author** mode, follow this procedure:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste **https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml** in the **Show add-ons from** field or select it from the drop-down menu.
3. Select the **Oxygen CGM support** add-on and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.

Result: You should be able to see CGM images in **Author** mode.

Note:
If you want to render CGM images in your PDF output, make sure you add support for this image format in the transformation scenario *(on page 2115)*.

Rendering PDF Images

Oxygen XML Editor provides built-in support for rendering PDF images in **Author** mode and PDF output.

Rendering PSD Images

Oxygen XML Editor provides support for rendering PSD (Adobe Photoshop) images.

To allow the rendering of PSD images in **Author** mode, follow this procedure:

1. Download the following *JAR (on page 3420)* files:
   - http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-lang/3.1.0/common-lang-3.1.0.jar
   - http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-io/3.1.0/common-io-3.1.0.jar
   - http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-image/3.1.0/common-image-3.1.0.jar
   - http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-core/3.1.0/imageio-core-3.1.0.jar
   - http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-metadata/3.1.0/imageio-metadata-3.1.0.jar
   - http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-psd/3.1.0/imageio-psd-3.1.0.jar
2. Copy the downloaded *JAR* libraries to the `[OXYGEN_INSTALL_DIR]\lib` directory.
3. Restart the application.

Rendering EPS and AI Images

Most EPS and AI image files include a preview picture of the content. Oxygen XML Editor tries to render this preview picture. The following scenarios are possible:

- The EPS or AI image does not include the preview picture. Oxygen XML Editor cannot render the image.
- The EPS image includes a TIFF preview picture.

  Note:
  Some newer versions of the TIFF picture preview are rendered in gray-scale.

- The AI image contains a JPEG preview picture. Oxygen XML Editor renders the image correctly.

Rendering Special Images with Java Advanced Imaging (JAI) Plugin

Certain special image types can be rendered in Oxygen XML Editor by using a Java Advanced Imaging (JAI) Image I/O Tools plugin.

How to Install JAI Image I/O Tools Plugin

To install this plugin, follow this procedure:

1. Start Oxygen XML Editor and open the **Help > About** dialog box. Go to the **System properties** tab and look for the *java.runtime.name* and *java.home* properties. Keep their values for later use.
2. Download the JAI Image I/O kit corresponding to your operating system and Java distribution (found in the *java.runtime.name* property). A list of archived JAI distributions can be found at: http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html.

   > **Note:**
   > The JAI API is not the same thing as JAI Image I/O. Make sure you have installed the latter.

3. Run the installer. When the installation wizard displays the **Choose Destination Location** page, fill-in the **Destination Folder** field with the value of the *java.home* property. Continue with the installation procedure and follow the on-screen instructions.

macOS Workaround

There is no native implementation of the JAI Image I/O Tools plugin for macOS 10.5 and later. However, it has a Java implementation fallback that also works on macOS. Some of the image formats are not fully supported in this fallback mode, but at least the TIFF image format is known to be supported.

Use the following procedure for this macOS workaround:

1. Download a Linux (`tar.gz`) distribution of the JAI Image I/O Tools plugin. A list of archived JAI distributions can be found at: http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html.
2. In the *[OXYGEN_INSTALL_DIR]*`/lib` directory, create a directory named `endorsed` (*[OXYGEN_INSTALL_DIR]*`/lib/endorsed`).
3. Unpack the `tar.gz`. Copy the `clibwrapper_jiio.jar` and `jai_imageio.jar` files from its `lib` directory and paste them in the *[OXYGEN_INSTALL_DIR]*`/lib/endorsed` directory.
4. Restart the application and the JAI Image I/O support will be up and running.

Retina/HiDPI Images in Author Mode

Oxygen XML Editor provides support for Retina and HiDPI images through simple naming conventions. The higher resolution images are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, images with a Retina scaling factor of 2 will include *@2x* in the name (for example, `myImage@2x.png`). Oxygen XML Editor displays the larger set of icons starting with 150% (1.5x) scaling.

You can reference an image to style an element in a CSS by using the `url` function in the `content` property, as in the following example:

```
listItem:before{
   content: url('../img/myImage.png');
}
```

This would place the image that is loaded from the `myImage.png` file just before the `<listItem>` element. However, if you are using a Retina display (on a Mac), the icon looks a bit blurry as it automatically gets scaled, or if you are using an HiDPI display (on a Windows-based PC), the icon remains at the original size, thus it will look very small. To solve this rendering problem, you need to be able to reference both a *normal* DPI image and a *high* DPI image. However, referencing both of them from the CSS is not practical, as there is no standard way of doing this.

Starting with version 17, Oxygen XML Editor interprets the argument of the `url` function as key rather than a fixed URL. Therefore, when running on a system with a Retina or HiDPI display, Oxygen XML Editor will first try to find the image file that corresponds to the retina scaling factor. For instance, using the previous example, Oxygen XML Editor would first try to find `myImage@2x.png`. If this file is not found, it defaults back to the *normal* resolution image file (`myImage.png`).

Oxygen XML Editor also supports dark color themes. This means that the background of the editor area can be of a dark color and the foreground a lighter color. On a dark background, you may find it useful to invert the colors of images. Again, this can be done with simple naming conventions. If an image designed for a dark background is not found, the *normal* image is used.

Retina/HiDPI Naming Convention

Refer to the following table for examples of the Retina/HiDPI image naming convention that is used in Oxygen XML Editor:

Color Theme	Referred Image File	Double Density Image File	Triple Density Image File
normal	../img/myImage.png	../img/myImage@2x.png	../img/myImage@3x.png
dark	../img/myImage_dark.png	../img/myImage_dark@2x.png	../img/myImage_dark@3x.png

Related Information:

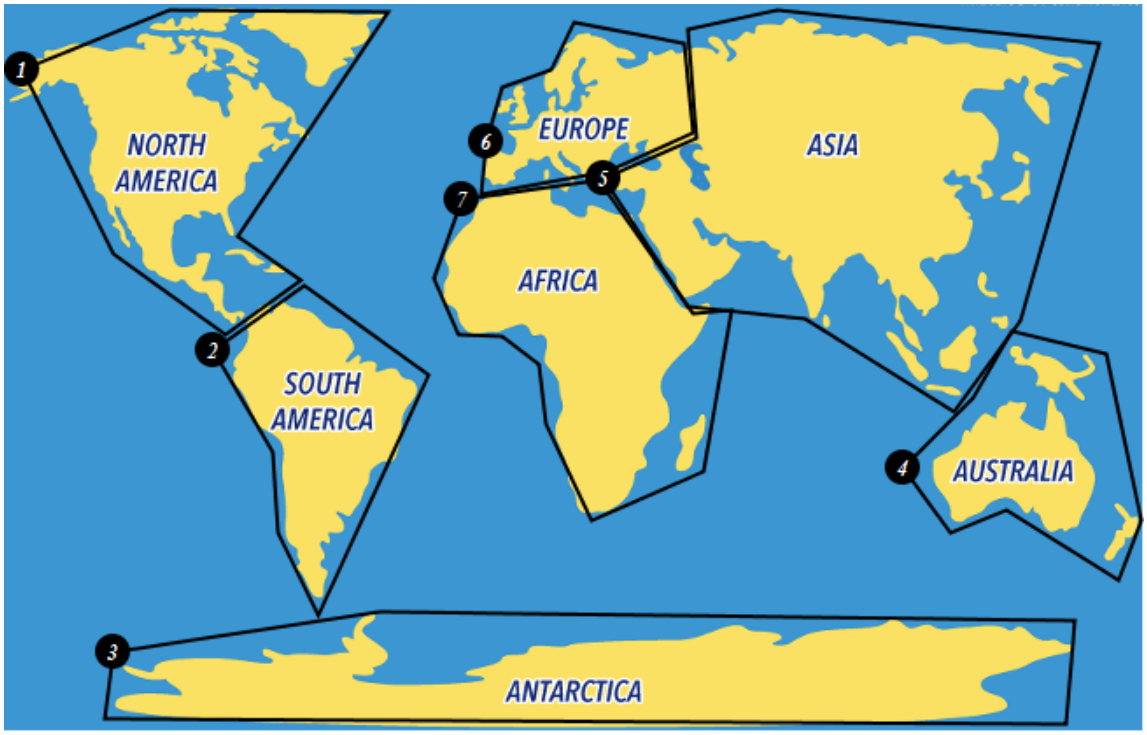
Using Retina/HiDPI Icons for the Actions from a Framework *(on page 2299)*

Image Map Editor

Oxygen XML Editor includes an **Image Map Editor** that allows you to create hyperlinks in specific areas of an image that will link to various destinations. For example, an image that is a map of the seven continents may have a specific hyperlink for each continent that links to a resource that has information about the particular continent. The main purpose of an **image map** is to provide an easy way of linking various parts of an image without having to divide the image into separate image files.

The support for image maps in Oxygen XML Editor is available for images in DITA, DocBook, TEI, and XHTML document types (*frameworks (on page 3420)*). To create an image map on an existing image and open the **Image Map Editor**, right-click the image and select **Image Map Editor**.

Figure 212. Image Map Rendered in Author Mode



Working with Image Maps in DITA

Oxygen XML Editor includes support for **image maps** in DITA documents through the use of the `<imagemap>` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

Figure 213. Image Map Editor in DITA

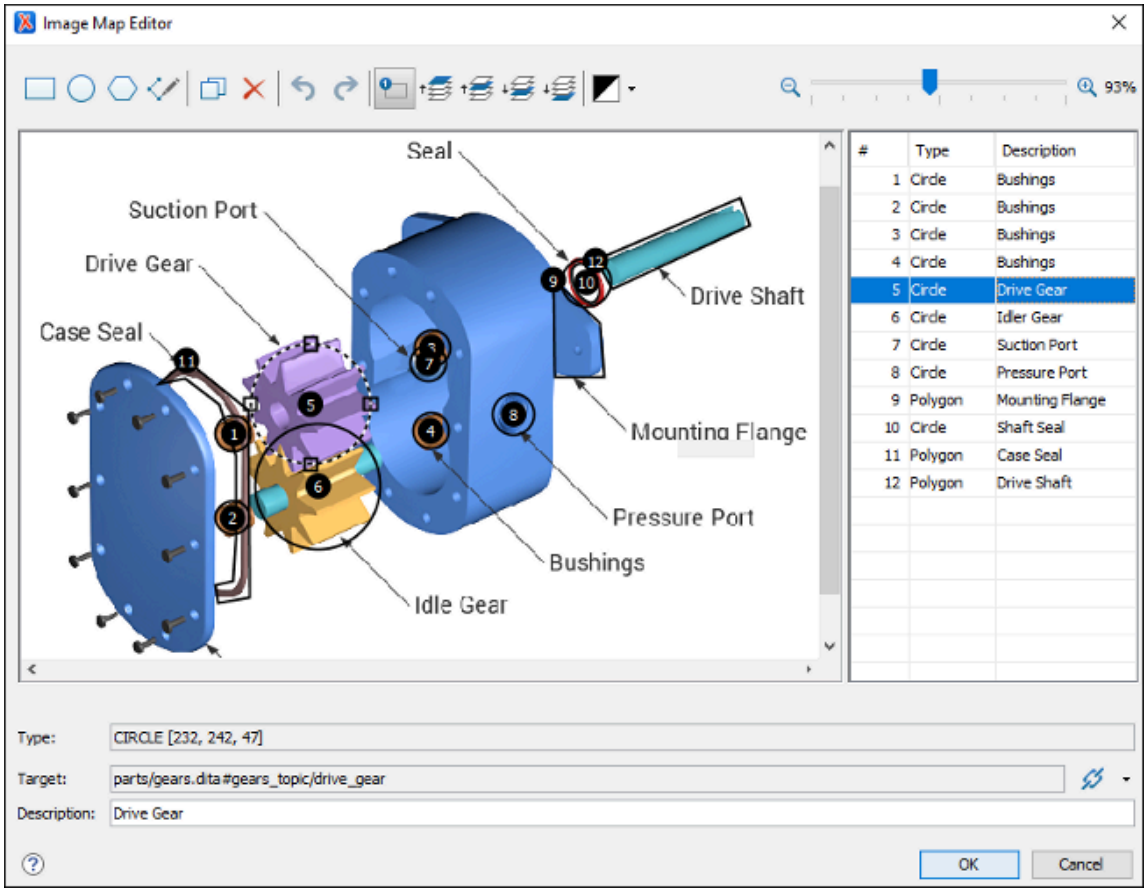


Image Map Editor Interface in DITA

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar

New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

New Free Form Shape

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape.

Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

 **Duplicate**

Use this button to create a duplicate of the currently selected shape.

 **Delete**

Use this button to delete the currently selected shape.

 **Undo**

Use this button to undo the last action.

 **Redo**

Use this button to redo the last action that was undone.

 **Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

 **Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

 **Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

 **Send Shape Backward**

Use this button to send the currently selected shape back one layer.

 **Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

 **Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

 **Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape further or **Alt** to move it 1 pixel at a time.
- To zoom in or out, you can use the **NumPad +** or **NumPad -** keys respectively. Use **Ctrl + NumPad 0** to reset the zoom level to its default value.
- You can use **Ctrl + Z** to undo an action or **Ctrl + Y** to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

Add Point

Adds a point to *Polygon* or *Free Form* shapes.

Remove Point

Removes the current point from *Polygon* or *Free Form* shapes.

Duplicate

Create a duplicate of the currently selected shape.

Delete

Delete the currently selected shape.

New Rectangle

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo

Use this action to undo the last action.

Redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

Properties

Type

Displays information about the selected coordinate.

Target

Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the **Link** drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference**, **File Reference**, or **Web Link**. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in DITA *(on page 3255)* by using the identical **Link** drop-down menu from the main toolbar.

When you click **OK** to finalize your changes in the **Image Map Editor**, an `<xref>` element will be inserted with either an `@href` attribute or a `@keyref` attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Editor *(on page 3255)*.

Description

You can enter an optional description for the selected area (shape) that will be displayed in the **Image Map Details** section *(on page 741)* in **Author** mode and as a tooltip message when the end-user hovers over the hyperlink in the output.

How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

   Step Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (**New Rectangle**, **New Circle**, or **New Polygon**).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar *(on page 737)* to adjust its layer and color, or to perform other editing actions.

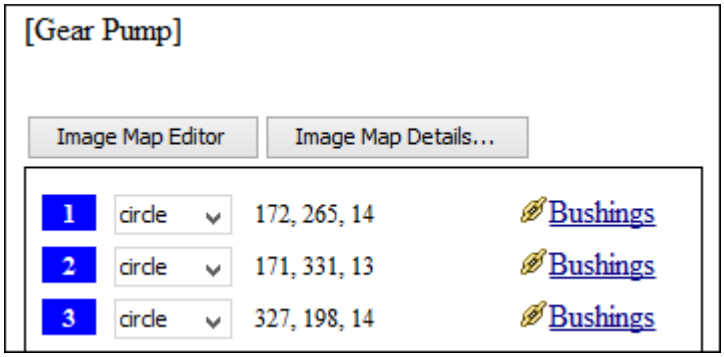
   > **Tip:**
   > You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions *(on page 739)*. For example, the easiest way to remove a point is to right-click the point and select **Remove Point**.

4. With the shape selected, use one of the linking options *(on page 740)* in the **Link** drop-down menu to select a target resource (or enter its path in the **Target** *(on page 740)* text field).
5. (Optional) Enter a **Description** *(on page 740)* for the selected area (shape).
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `<alt>` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Figure 214. Image Map Details



How to Edit an Existing Image Map in DITA

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor** toolbar *(on page 737)*). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar *(on page 737)* (, , ,).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

DITA '*imagemap*' Element Specifications
Working with Images in DITA Topics *(on page 3152)*

Image Maps in DocBook

Oxygen XML Editor includes support for **image maps** in DocBook documents through the use of the `<areaspec>` element. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

Figure 215. Image Map Editor in DocBook

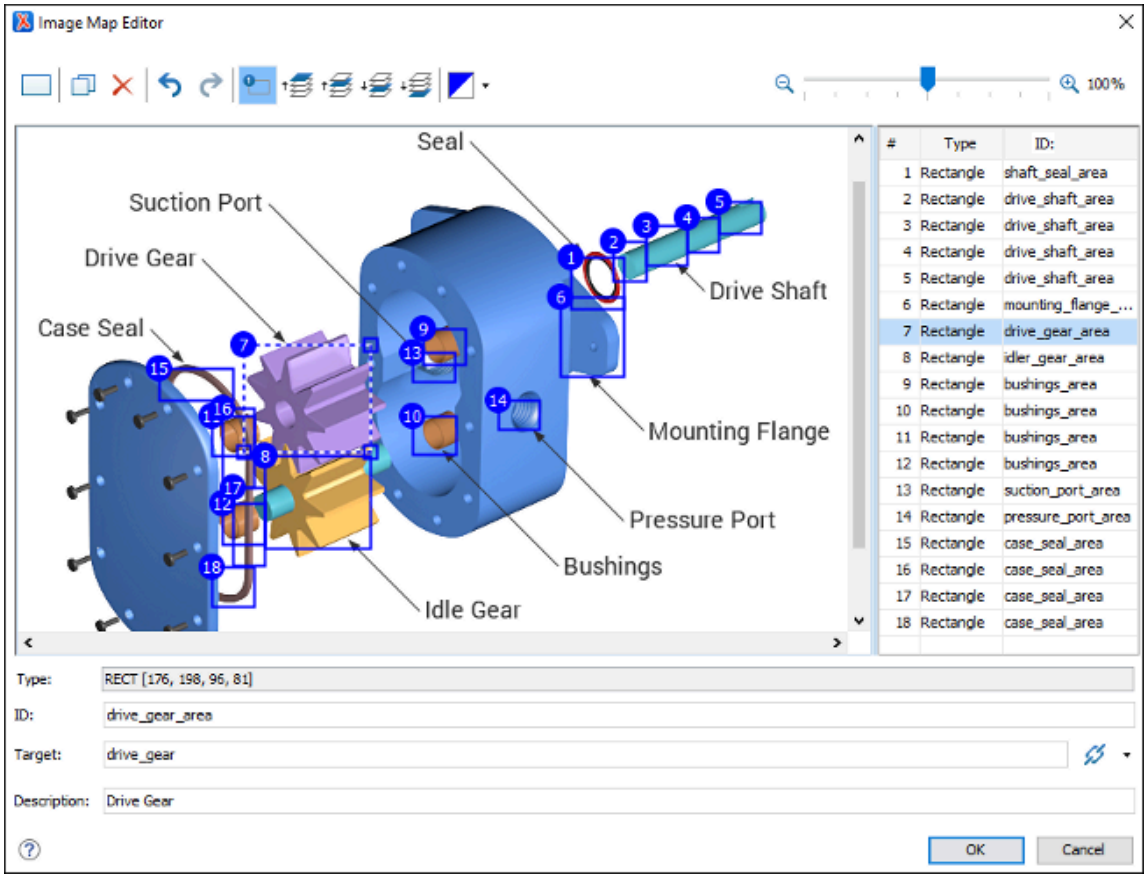

Image Map Editor Interface in DocBook

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar

New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

Duplicate

Use this button to create a duplicate of the currently selected shape.

Delete

Use this button to delete the currently selected shape.

Undo

Use this button to undo the last action.

Redo

Use this button to redo the last action that was undone.

Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

 **Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

 **Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

 **Send Shape Backward**

Use this button to send the currently selected shape back one layer.

 **Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

 **Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

 **Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape further or **Alt** to move it 1 pixel at a time.
- To zoom in or out, you can use the **NumPad +** or **NumPad -** keys respectively. Use **Ctrl + NumPad 0** to reset the zoom level to its default value.
- You can use **Ctrl + Z** to undo an action or **Ctrl + Y** to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

 **Duplicate**

Create a duplicate of the currently selected shape.

 **Delete**

Delete the currently selected shape.

 **New Rectangle**

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

 **Undo**

Use this action to undo the last action.

 **Redo**

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

Properties

Type

Displays information about the selected coordinate.

ID

The identifier for the selected area. This will become the value of the `@xml:id` attribute for the particular `<area>` element.

Target

Allows you to choose the target resource that you want the selected area to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the  **Link** drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference** or **Web Link**. Both types open a dialog box that allows you to select the target resource and it is inserted as the value of an `@xlink:href` attribute.

Description

You can enter an optional description for the selected area that will be displayed in the **Image Map Details** section *(on page 746)* in **Author** mode and as a tooltip message when the end-user hovers over the hyperlink in the output.

How to Create an Image Map in DocBook

To create an image map on an existing image in a DocBook document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

   Step Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting the **New Rectangle** button.
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar *(on page 743)* to adjust its layer and color, or to perform other editing actions.

   > **Tip:**
   > You can right-click any of the shapes or anywhere in the Image Pane to access various helpful contextual menu actions *(on page 744)*.

4. With the shape selected, enter an **ID** *(on page 745)* and use one of the linking options *(on page 745)* in the **Link** drop-down menu to select a target resource (or enter its path in the **Target** *(on page 745)* text field).
5. (Optional) Enter a **Description** *(on page 745)* for the selected area (shape).
6. If you want to add more hyperlinks to the image, select **New Rectangle** button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `<alt>` element, its value will be displayed above the image. The following two buttons will also now be available at the top of the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

How to Edit an Existing Image Map in DocBook

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button above the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

Note:
If you want to link a set of related `<area>` elements, you can use `<areaset>` elements. To add `<areaset>` elements, and `<area>` elements to the *areasets*, switch to **Text** mode and insert them manually.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor** toolbar *(on page 743)*). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar *(on page 743)* (, , ,).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Image Maps in TEI

Oxygen XML Editor includes support for **image maps** in TEI documents through the use of the `<facsimile>` element. In TEI documents, this feature provides an easy way to create areas (using `<zone>` elements) in an image where the end-user can hover or click to retrieve more information about that particular area of the image. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create the areas in the image.

Figure 216. Image Map Editor in TEI

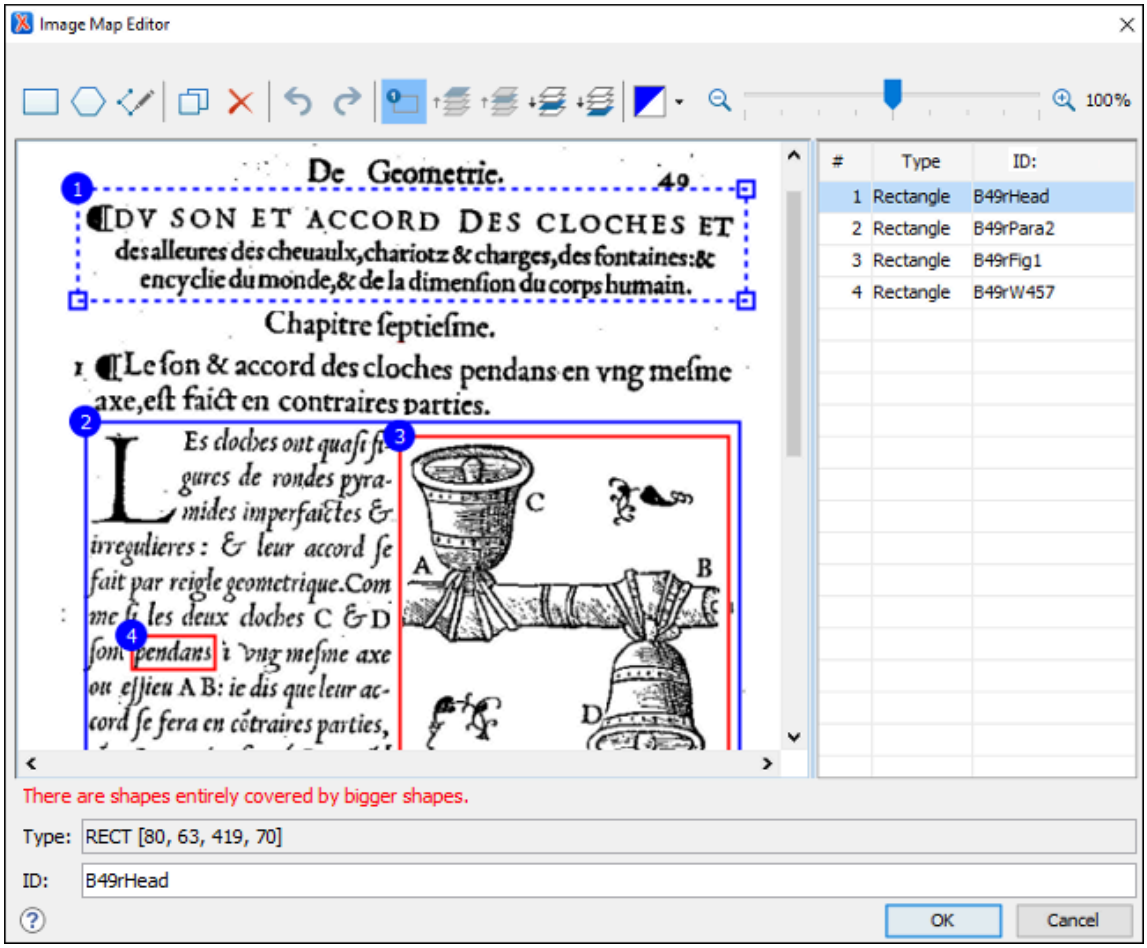

Image Map Editor Interface in TEI

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar

New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Polygon

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

New Free Form Shape

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or

simply double-click the last point to automatically add the line from the last point back to the first.

 **Duplicate**

Use this button to create a duplicate of the currently selected shape.

 **Delete**

Use this button to delete the currently selected shape.

 **Undo**

Use this button to undo the last action.

 **Redo**

Use this button to redo the last action that was undone.

 **Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

 **Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

 **Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

 **Send Shape Backward**

Use this button to send the currently selected shape back one layer.

 **Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

 **Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

 **Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape further or **Alt** to move it 1 pixel at a time.
- To zoom in or out, you can use the **NumPad +** or **NumPad -** keys respectively. Use **Ctrl + NumPad 0** to reset the zoom level to its default value.
- You can use **Ctrl + Z** to undo an action or **Ctrl + Y** to redo the last action that was undone.

Contextual Menu Actions

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

Add Point

Adds a point to *Polygon* or *Free Form* shapes.

Remove Point

Removes the current point from *Polygon* or *Free Form* shapes.

Duplicate

Create a duplicate of the currently selected shape.

Delete

Delete the currently selected shape.

New Rectangle

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Polygon

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo

Use this action to undo the last action.

Redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

Properties

Type

Displays information about the selected coordinate.

ID

The identifier for the selected area. This will become the value of the `@xml:id` attribute for the particular `<zone>` element. When you insert a new zone, a unique ID is automatically generated and displayed in this field. However, you can change this value if you want to.

How to Create an Image Map in TEI

To create an image map on an existing image in a TEI document, follow these steps:

1. The image (`<graphic>`) must be inside a `<facsimile>` element to support the **Image Map Editor** feature.
2. Right-click the image and select **Image Map Editor**.

   Step Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.
3. Add areas (zones) in the image by selecting one of the shape buttons (**New Rectangle** or **New Polygon**).
4. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar *(on page 748)* to adjust its layer and color, or to perform other editing actions.

   Tip:
   You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions *(on page 750)*. For example, the easiest way to remove a point is to right-click the point and select **Remove Point**.
5. With the shape selected, enter an **ID** *(on page 751)*.

6. If you want to add more areas (zones) to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and the following two buttons will now be available at the bottom of the image:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

How to Edit an Existing Image Map in TEI

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

Restriction:
Currently, if `<zone>` elements contain additional content (such as text or comments) and you edit the image map, the **Image Map Editor** does not preserve the additional content. Therefore, if you do need to insert additional content inside the `<zone>` elements, you should do so after the image map has been created and finalized. Subsequent changes to the image map should then be done in **Text** mode.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor** toolbar *(on page 748)*). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar *(on page 748)* (, , ,).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Warning:
PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

Image Maps in XHTML

Oxygen XML Editor includes support for **image maps** in XHTML documents. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. In HTML, an image (in the form of an `<img>` element) may be associated with an image map (in the form of a `<map>` element) by specifying a `@usemap` attribute on the `<img>` element. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

Figure 217. Image Map Editor in XHTML

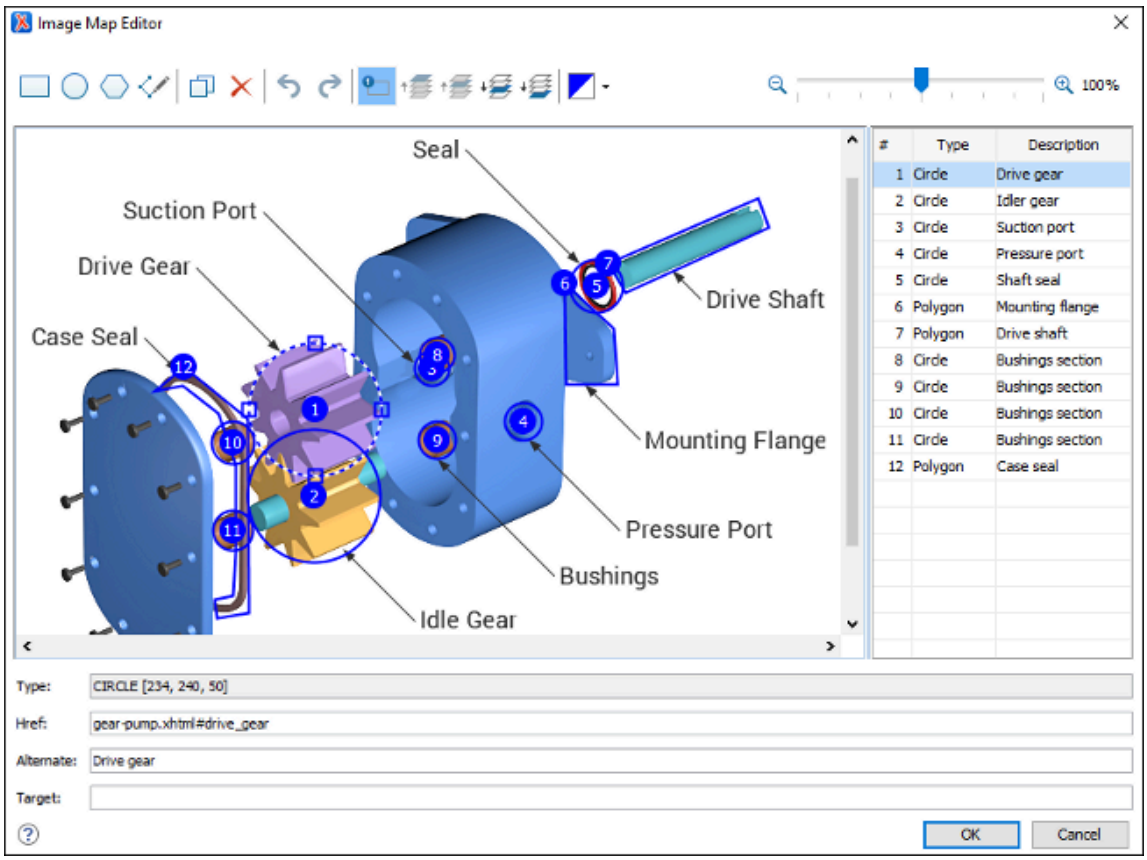

Image Map Editor Interface in XHTML

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar

New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

New Free Form Shape

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

Duplicate

Use this button to create a duplicate of the currently selected shape.

Delete

Use this button to delete the currently selected shape.

Undo

Use this button to undo the last action.

Redo

Use this button to redo the last action that was undone.

Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

Send Shape Backward

Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

 **Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

 **Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape further or **Alt** to move it 1 pixel at a time.
- To zoom in or out, you can use the **NumPad +** or **NumPad -** keys respectively. Use **Ctrl + NumPad 0** to reset the zoom level to its default value.
- You can use **Ctrl + Z** to undo an action or **Ctrl + Y** to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

 **Add Point**

Adds a point to *Polygon* or *Free Form* shapes.

 **Remove Point**

Removes the current point from *Polygon* or *Free Form* shapes.

 **Duplicate**

Create a duplicate of the currently selected shape.

Delete

Delete the currently selected shape.

New Rectangle

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo

Use this action to undo the last action.

Redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (value of the **Alternative** property). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

Properties

Type

Displays information about the selected coordinate.

Href

Specifies the hyperlink target for the selected area. This will become the value of the `@href` attribute for the particular `<area>` element. The possible values are:

- **An Absolute URL** - A URL of another website (for example, `http://www.example.com/index.htm`).
- **A Relative URL** - A link to a file within your website (for example, `index.htm`).
- **An Element** - A link to the ID of an element within the page (for example, `#top`).

- **Other Protocols** - A specified path using other protocols (such as `https://`, `ftp://`, `mailto:`, `file:`).
- **A Script** - A link to a script (for example, `javascript:alert('Hello');`)

Alternate

The description for the selected area. The value is inserted in an `@alt` attribute in the particular `<area>` element. This is a required attribute to present a text alternative for browsers that do not display images.

Target

Specifies where to open the linked resource. The allowed values are:

- **_blank** - Opens the linked resource in a new window or tab.
- **_self** - Opens the linked resource in the same frame as it was clicked.
- **_parent** - Opens the linked resource in the full body of the window.
- **framename** - Opens the linked resource in the named frame.

How to Create an Image Map in XHTML

To create an image map on an existing image in an XHTML document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

   Step Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons ( **New Rectangle**,  **New Circle**, or  **New Polygon**).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar *(on page 753)* to adjust its layer and color, or to perform other editing actions.

   

   Tip:
   You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions *(on page 755)*. For example, the easiest way to remove a point is to right-click the point and select  **Remove Point**.

4. With the shape selected, specify the hyperlink target in the **Href** field *(on page 756)* and enter a description for the selected area in the **Alternate** field *(on page 757)*.
5. (Optional) Specify where the hyperlink resource will be opened in the **Target** field *(on page 757)*.
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and its properties are displayed in a section below the image.

How to Edit an Existing Image Map in XHTML

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

In **Author** mode, the details of the image map are also displayed below the image and you can edit the description, href, shape, and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor** toolbar *(on page 753)*). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar *(on page 753)* (, , ,).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Warning:
PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

HTML Image Map Specifications

Adding Video, Audio, and Embedded HTML Resources

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA, DocBook, or XHTML topics. The media resources can be played directly in **Author** mode and in all

HTML5-based outputs. There is a toolbar button () that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the **Project** view *(on page 413)* and drop them into your documents (or copy and paste them).

Table 6. Supported Media Types

Media	Description	Type	Supported Size Properties
mp3	Moving Picture Experts Group Layer-3 Audio	audio	Width
wav	Windows Wave	audio	Width
pcm	Pulse Code Modulation	audio	Width
m4a	Moving Picture Experts Group Layer-4 Audio	audio	Width
aif	Audio Interchange Format	audio	Width
mp4	Moving Picture Experts Group Layer-4 Video	video	Width & Height
m4v	iTunes Video File	video	Width & Height
avi	Audio Video Interleaved	video	Width & Height
embedded video (such as *YouTube*, *Vimeo*, or *Vidyard*)	Embedded Iframe Code	iframe	Width & Height

Adding a Media Resource

To insert a media resource in a document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the  **Insert Media Resource** action from the toolbar. A **Chose Media** dialog box appears.

   > **Note:**
   > You can also drag media files from your system explorer or the **Project** view *(on page 413)* and drop them into your documents (or copy and paste them).

3. Select the URL for the media resource and click **Ok**.

Result in Author Mode: A reference to the specified media object is inserted and rendered in **Author** mode so that it can be played directly from there.

Attention:

- On Ubuntu 17.10, if you receive an error when trying to play videos in **Author** mode, you need to install the `libavformat57` library.

Result in Output: In the publishing stage, the media object is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

Embedding HTML Content in DITA Topics

The DITA Open Toolkit that comes bundled with Oxygen XML Editor includes a pre-installed *plugin (on page 3422)* that allows you to embed well-formed HTML content directly in a DITA topic.

For example, suppose you wanted to embed a YouTube video directly in a DITA topic.

The DITA topic would look like this:

```
....
<foreign outputclass="html-embed"><![CDATA[
                <iframe width="420" height="315"
                  src="https://www.youtube.com/embed/qepRkQxhTX"
                  frameborder="0" allowfullscreen="true">
                </iframe>
                ]]></foreign>
....
```

The converted HTML output would look like this:

```
...........
<iframe width="420" height="315" src="https://www.youtube.com/embed/qepRkQxhTX"
frameborder="0" allowfullscreen="true">
</iframe>
............
```

The *plugin* is also available on the *oxygenxml GitHub projects page*.

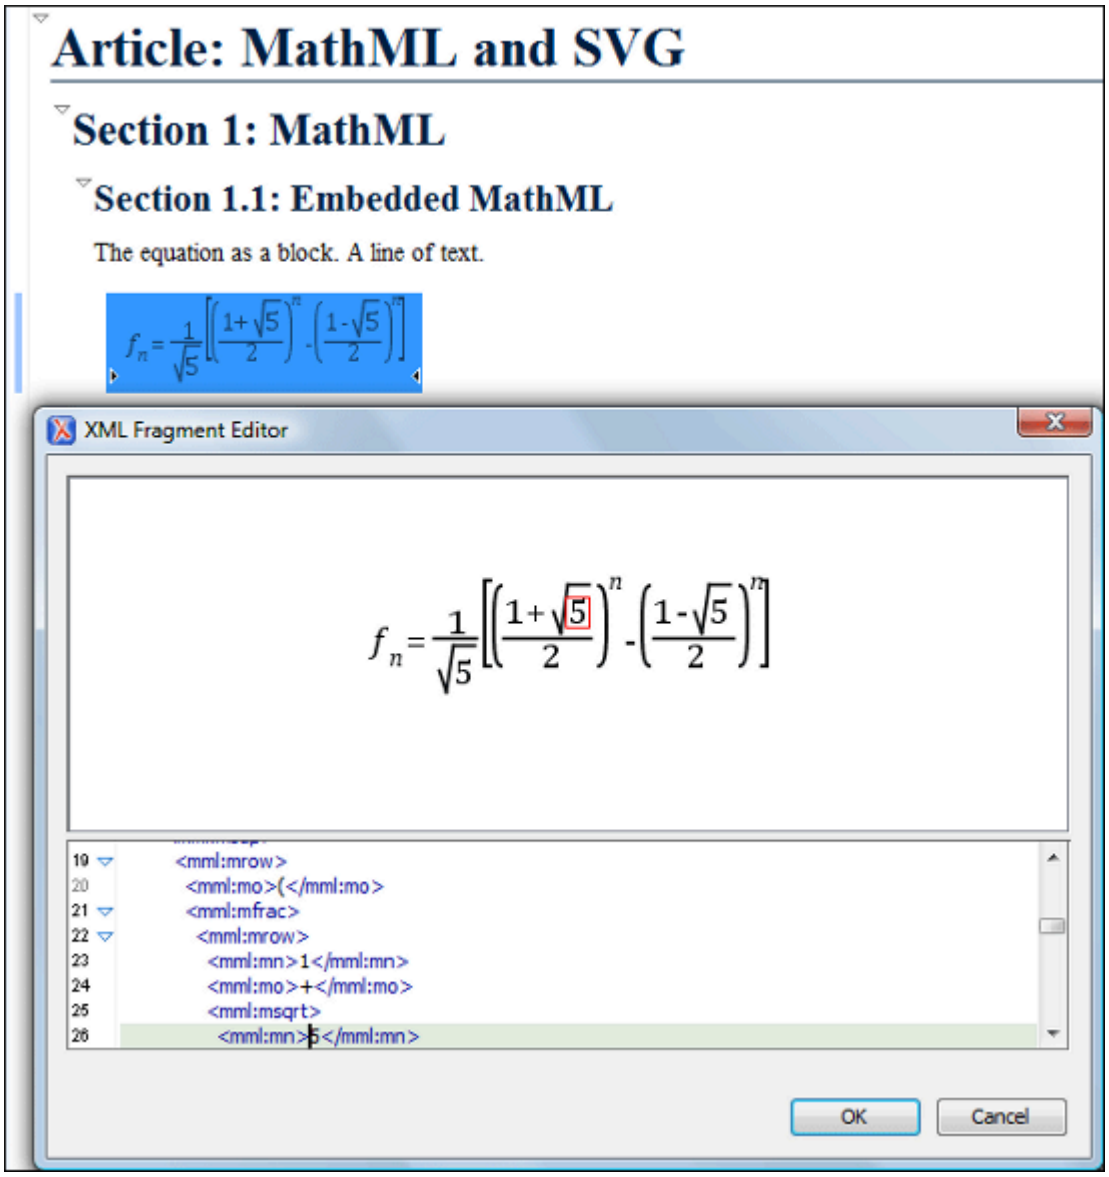
How to Add Video and Audio Objects in DITA WebHelp Output *(on page 1727)*

Editing MathML Notations

Oxygen XML Editor includes a built-in editor for *MathML* notations. To start the *MathML* editor, double-click a *MathML* notation (for embedded notations, you can also select the **Edit Equation** action from its contextual menu). In the *MathML* editor, you can edit the mathematical symbols of a *MathML* notation. To open a *MathML*

file from your current project, select **Open with > MathML editor** from the contextual menu in the **Project** view *(on page 413)*.

Figure 218. Default *MathML* Editor



The font size and font family that is used for the equations is based upon the context where the MathML equation appears. To configure the minimum font size of the equation, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Edit modes > Author > MathML**.

Tip:
For editing *MathML* equations, you can also try free choices, such as Apache OpenOffice Math *(on page 762)* or LibreOffice Math *(on page 762)*.

Configuring the MathType Editor

The Wiris *MathType* integration can replace the default *MathML* editor with a specialized *MathML* editor.

Details about downloading *MathType* can be found here: https://www.wiris.com/en/mathtype/mathtype-for-oxygen/.

Installation steps and details about purchasing the product can be found here: https://docs.wiris.com/mathtype/en/mathtype-for-oxygen-xml-author/mathtype-for-oxygen-xml-author.html.

Configuring an External MathML Editor

You can configure Oxygen XML Editor to use a third-party MathML editor (e.g. the free Libre Office equation editor) by following these steps:

1. Install the third-party application (for example, Libre Office).
2. Open the **MathML** preferences page *(on page 199)* and in the **External application > Command line** field, set the command line used to open the external application.

   For example, the following commands could be used to edit MathML equations with a LibreOffice application (depending on the O.S.):
   - **Windows** - `"C:\Program Files\LibreOffice\program\smath.exe" --nologo "${cf}"`
   - **macOS** - `/Applications/LibreOffice.app/Contents/MacOS/soffice --math --nologo "${cf}"`
   - **Linux** - `/usr/lib/libreoffice/program/smath --nologo "${cf}"`

   You can use the `${cf}` editor variable in the command line to refer to a temporary file automatically created by Oxygen XML Editor that will contain the edited MathML content.
3. Insert a new equation or double-click an existing equation. The external application starts and it should display the equation inside it. Once you save the equation and close the external application, the equation rendered in the **Author** visual editing mode will refresh its contents based on your changes. When editing and saving the equation in the started external application, do not alter the path to the saved file in any way as the file is specifically saved in a location from where the Oxygen XML Editor application will load it automatically.

Configuring the MathFlow Editor (Deprecated)

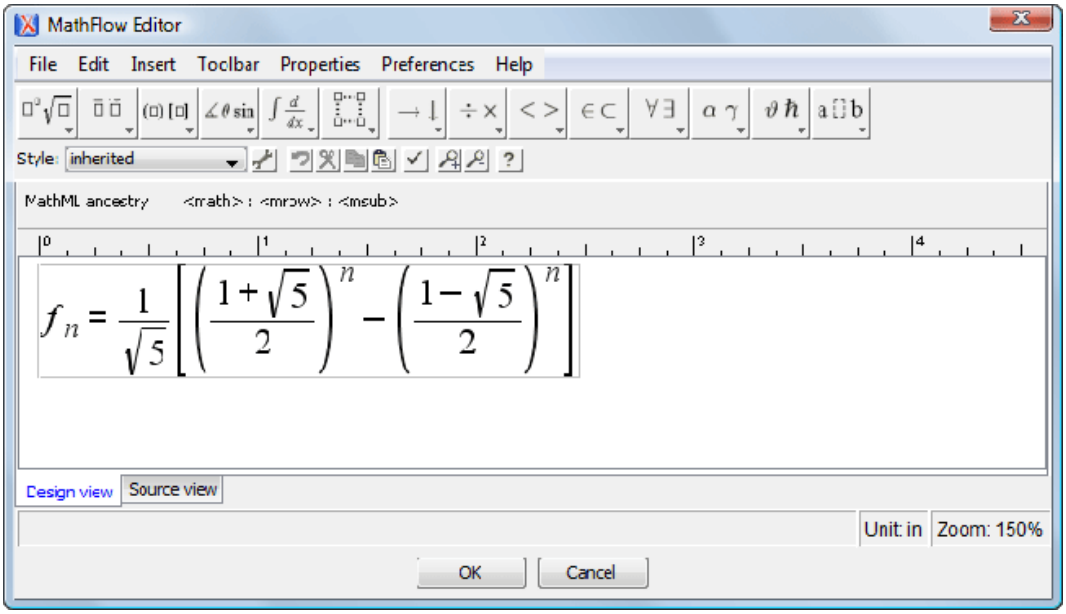
Note:
The *MathFlow* editor integration has been marked as deprecated and was replaced with a new *MathType* integration developed by *Wiris (on page 761)*.

The *MathFlow* Components product can replace the default *MathML* editor with a specialized *MathML* editor. You have to purchase a *MathFlow* Component from Wiris and configure it in Oxygen XML Editor with the following procedure:

1. Install *MathFlow* by using the *Universal* installer (for versions prior to 2.1, use the *MathFlow SDK*).
2. Set the path to the *MathFlow* install folder in the **MathML** preferences page *(on page 199)*.

3. Set the path to the *MathFlow* license file in the **MathML** preferences page *(on page 199)*.

Figure 219. Default MathFlow Editor



Special Character Support in Author Mode

Oxygen XML Editor offers support for bidirectional text, such as Arabic or Hebrew languages that require right-to-left scripts, certain Asian languages (such as *Devanagari*, *Bengali*, *Gurmukhi*, *Gujarati*, *Oriya*, *Tamil*, *Telugu*, *Kannada*, *Malayalam*, *Sinhala*, *Thai*, *Khmer*), or other special characters (such as combining characters). To achieve this, Oxygen XML Editor uses the Unicode Bidirectional Algorithm, as specified by the Unicode Consortium. The text arrangement is similar to what you get in a modern HTML browser. The final text layout is rendered according to the directional CSS properties matching the XML elements and the Unicode directional formatting codes.

By default, when navigating bidirectional text with the arrow keys in **Author** mode, pressing the right arrow key moves the cursor in the writing direction and the left arrow moves it in the opposite direction. However, if the **Arrow keys move the cursor in the writing direction** option *(on page 188)* in the **Cursor Navigation** preferences page is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

Tip:
If you experience performance issues when editing documents that contain bidirectional text, you could try one of the following solutions:

- The Eclipse plugin distribution of Oxygen XML Editor is faster than the standalone version when working with bidirectional text.
- You could try changing the font. For example, you could try using the*David* font in Hebrew content. If it is not already installed in your operating system, this font is available at: https://www.microsoft.com/typography/fonts/family.aspx?FID=234. To change the font in Oxygen

XML Editor, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Appearance > Fonts**, and change the font using the **Author default font** option in the **Fonts** preferences page *(on page 140)*.

Resources

For more information about the bidirectional text support in the **Author** mode, watch our video demonstration:

https://www.youtube.com/embed/IC0ahH1IS7s

Inserting Special Characters with the Character Map *(on page 475)*

Controlling the Text Direction Using XML Markup

Oxygen XML Editor Supports the following CSS properties that control the direction of text:

Table 7. CSS Properties Controlling Text Direction

direction	Specifies the writing direction of the text. The possible values are **ltr** (the text direction is left to right), **rtl** (the text direction is right to left, and **inherit** (the direction property is inherited from the parent element).
unicodeBidi	Used along with the **direction** property to create levels of embedded text with different text directions in the same document. The possible values of this property are **bidi-override** (creates an additional level of embedding and forces all strong characters to the direction specified in the **direction**), **embed** (creates an additional level of embedding), **normal** (does not use an additional level of embedding), and **inherit** (the value of the **unicodeBidi** property is inherited from parent element).

For instance, to declare an element as being Right to Left, you could use a stylesheet like this:

XML File:

```
<article>
  <myRTLpara>RIGHT TO LEFT TEXT</myRTLPara>
</article>
```

Associated CSS File:

```
myRTLpara{
    direction:rtl;
```

```
    unicode-bidi:embed;
}
```

Oxygen XML Editor recognizes the **dir** attribute on any XML document. The supported values are:

Values	Description
ltr	The text from the current element is Left to Right, embedded.
rtl	The text from the current element is Right to Left, embedded.
lro	The text from the current element is Left to Right, embedded.
rlo	The text from the current element is Right to Left, embedded.

The following XML document types make use of the **dir** attribute with the above values:

- DITA
- DocBook
- TEI
- XHTML

Note:
When the *inline element (on page 3420)* tags are visible, the text in the line is arranged according to the BIDI algorithm after replacing the tags symbols with Object Replacement Characters. This makes it possible to get a different text arrangement when viewing a document in the **No Tags** mode versus viewing it in the **Full Tags** mode.

Controlling the Text Direction Using the Unicode Direction Formatting Codes

These Unicode Direction Formatting Codes codes can be embedded in the edited text, specifying a text direction and embedding. However, it is not recommended to use them in XML as they are zero width characters, making it hard to debug the text arrangement.

Table 8. Directional Formatting Codes

U+202A (LRE)	LEFT-TO-RIGHT EMBEDDING	Treats the following text as embedded left-to-right.
U+202B (RLE)	RIGHT-TO-LEFT EMBEDDING	Treats the following text as embedded right to left.
U+202D (LRO)	LEFT-TO-RIGHT OVERRIDE	Forces the following characters to be treated as strong left-to-right characters.
U+202E (RLO)	RIGHT-TO-LEFT OVERRIDE	Forces the following characters to be treated as strong right-to-left characters.
U+202C (PDF)	POP DIRECTIONAL FORMAT-TING CODE	Restores the bidirectional state to what it was before the last LRE, RLE, RLO, or LRO.

Table 8. Directional Formatting Codes (continued)

U+200E (LRM)	LEFT-TO-RIGHT MARK	Left-to-right strong zero-width character.
U+200F (RLM)	RIGHT-TO-LEFT MARK	Right-to-left strong zero-width character.

To insert Unicode Direction Formatting Codes, use the **Character Map** *(on page 475)* dialog box. To easily find such a code, you can either enter directly the hexadecimal value, or use the **Details** tab to enter the codes name.

Oxygen XML Editor offers the support for bi-directional text in all the side views (**Outline** view *(on page 549)*, **Attributes** view *(on page 638)* and so on) and text fields.

Refreshing the Content

On occasion you may need to reload the content of the document from the disk or reapply the CSS. This can be performed by using the **Reload** (**F5**) action available on the toolbar.

To refresh the content of the referenced resources you can use the **Refresh references** action that is available in the menu for the current *framework* (for example, the **DITA** or **DocBook5** menu). However, this action will not refresh the expanded external entities. For that, you will need to use the **Reload** action.

Generating IDs for Elements in Author Mode

Oxygen XML Editor allows you to manually assign or edit values of `id` attributes in **Author** mode by using the **Attributes View** *(on page 638)* or an in-place attribute editor *(on page 619)*. Oxygen XML Editor also includes mechanisms to generate ID values for elements, either on-request or automatically, in DITA, DocBook, or TEI documents.

Generate IDs On-Request

You can generate ID values for specific elements on-request. To do so, select the element that will have an ID generated (or place the cursor inside the element) and select the **Generate IDs** action from the contextual menu. This action generates a unique ID for the current element. If you invoke the action on a block of selected content, the action will generate IDs for all top-level elements and elements that are listed in the **ID Options** dialog box *(on page 767)*. To open this dialog box, open an XML document that belongs to that specific document type and then select **ID Options** from the **DITA**, **DocBook**, or **TEI** main menu (depending on your document type).

Note:
The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `@id` attribute.

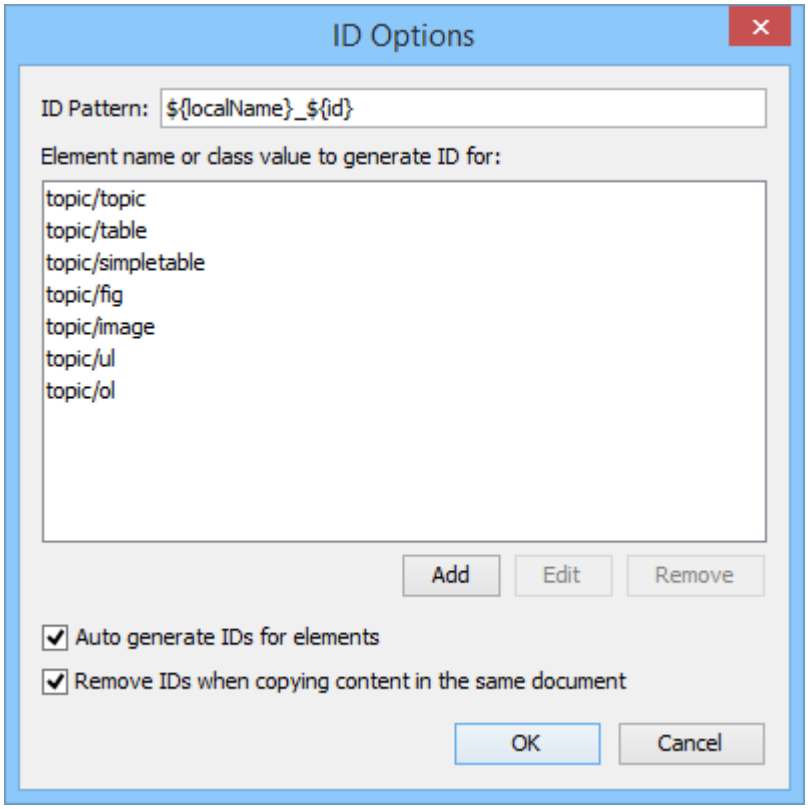
Automatically Generate IDs

Oxygen XML Editor includes an option to automatically add unique ID values to certain elements when they are created in **Author** mode. The **Auto generate IDs for elements** option can be found in the **ID Options** dialog box *(on page 767)* that is displayed when you select the **ID Options** action from the *framework (on page 3420)*-specific menu (**DITA**, **DocBook**, or **TEI**). If this **Auto generate IDs for elements** option is selected, Oxygen XML Editor automatically generates unique ID values for elements that are listed in this dialog box. You can use this dialog box to customize the format of the ID values and choose which elements will have their ID values automatically generated (for example, you can customize the list of elements to include those that you most often need to identify).

ID Options Dialog Box

To configure options for generating IDs, select **ID Options** from the **DITA**, **DocBook**, or **TEI** menu (depending on your document type).

Figure 220. ID Options Dialog Box



The **ID Options** dialog box allows you to configure the following options with regard to generating ID values:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor Editor Variables *(on page 332)*.

Element name or class value to generate ID for

The elements that will have ID values generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content in the same document (DITA or TEI)

When copying and pasting content in the same DITA or TEI document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note:
This option does not have an effect on content that is *cut* and *pasted*.

Remove IDs when copying content (DocBook)

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs in DocBook documents. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

Duplicating Elements with Existing IDs

If you duplicate elements with existing IDs (for example, through copy/paste or drag/drop actions), all IDs are removed at the resolution of the operation. However, you can use the options in the **ID Options** dialog box to change this behavior. The options in this dialog box affect duplicated elements with existing IDs in the following ways:

- Only the elements listed in this dialog box are affected by these options. Therefore, if you want to use these options to preserve IDs or generate new ones, you must first add the elements to be duplicated to the list in this dialog box.
- If the **Auto generate IDs for elements** option *(on page 768)* is selected and you duplicate elements with existing IDs, Oxygen XML Editor assigns new, unique ID values to the duplicates.
- If the **Auto generate IDs for elements** option *(on page 768)* is not selected and you duplicate elements with existing IDs, the ID values are removed from the duplicates.
- For DITA and TEI, if the **Remove IDs when copying content in the same document** option *(on page 768)* is selected, the ID values are removed from elements that are duplicated in the same document. If it is not selected, the ID values are preserved when elements are duplicated in the same document. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected and this option has no effect on elements that are duplicated in other documents.
- For DocBook, if the **Remove IDs when copying content** option *(on page 768)* is selected, the ID values are removed from any element that is duplicated. If it is not selected, the ID values are preserved when elements are duplicated. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected.

Controlling the Default ID Generation Options

It is possible to configure the default ID generation options for DITA, DocBook, and TEI document types. In the `frameworks` folder for each of those document types, there is an XML configuration file called `idGenerationDefaultOptions.xml` that contains the default settings for generating IDs in each particular type of document. To configure the default settings, you can edit this file and save it back to the same directory.

The configuration file can be found in the `resources` folder within the particular *framework* *(on page 3420)*. For example, the configuration file for the DITA *framework* is located in: *`[OXYGEN_INSTALL_DIR]`*`/frameworks/dita/resources/idGenerationDefaultOptions.xml`.

If you want to share your configured default ID generation settings with other members of your team, follow these steps:

1. Configure the `idGenerationDefaultOptions.xml` file for your *framework* according to your needs.
2. Bundle a modified version of the entire *framework* folder (for example, *`[OXYGEN_INSTALL_DIR]`*`/frameworks/dita/`). To do this:
    a. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Document Type Association**.
    b. Select your document type and click the **Extend** button.
    c. In the **Document type** configuration dialog box *(on page 147)* that is now displayed, select **External** for the **Storage** option. By default, this will save the extension in a new folder in the `frameworks` folder (for example, *`[OXYGEN_INSTALL_DIR]`*`/frameworks/dita-extension(1)`), but you can also use the **Browse** button to specify a specific name and folder.
    d. In this new extension folder, create a new folder called `resources` and add your modified `idGenerationDefaultOptions.xml` file to this new `resources` folder.
    e. Go back to the **Document Type Association** preferences page, select the extended *framework*, and click **Edit**.
    f. Go to the **Classpath** tab *(on page 152)*, add a reference to your new `resources` folder, and move this reference up (using the **Move Up** button) so that it is the first one that appears in the list.
    g. Click **OK** and exit out of the preferences page.
3. Distribute your newly extended folder to other team members by using one of the methods described in Sharing a Framework *(on page 2406)*.

Using Form Controls in Author Mode

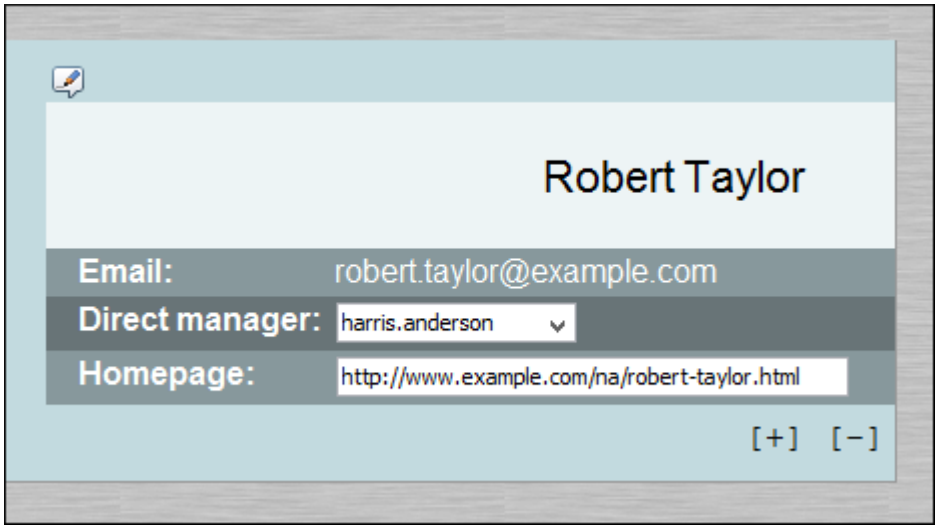
Form controls make it easier to capture, organize, and edit content. They are especially helpful for less technical users because form controls provide a way to interact with the content of a document in a graphical manner without intimidating the user with the XML structure.

Oxygen XML Editor includes a variety of built-in form controls *(on page 2491)* that can be defined in CSS stylesheets that are used to render **Author** mode *(on page 2491)*. You can also implement custom form controls *(on page 2523)* for more specific needs. The types of built-in form controls that are available include:

- Audio *(on page 2492)* - A media object that plays audio clips.
- Browser *(on page 2493)* - A media object that renders HTML frames or interact with SVG documents
- Button *(on page 2497)* - A graphical user interface object that performs a specific action.
- Button Group *(on page 2500)* - A graphical user interface group of buttons (such as radio buttons) that perform specific actions.
- Checkbox *(on page 2503)* - A graphical user interface box that you can click to select or deselect a value.
- Combo Box *(on page 2506)* - A graphical user interface object that can be a drop-down menu or a combination of a drop-down menu and a single-line text field.
- Date Picker *(on page 2508)* - A form control object that allows you to select a date in a specified format.
- HTML Content *(on page 2510)* - A graphical user interface box that is used for rendering HTML content.
- Pop-up *(on page 2512)* - A contextual menu that provides quick access to various actions.
- Text Area *(on page 2515)* - A box that allows you to enter multiple lines of text.
- Text Field *(on page 2518)* - A graphical user interface box that allows you to enter a single line of text.
- URL Chooser *(on page 2520)* - A dialog box that allows you to select the location of local or remote resources.
- Video *(on page 2522)* - A media object that plays videos.

The following image is an example of several form controls rendered in **Author** mode. The first (*Direct manager*) is a combo box with both a drop-down menu and an editable text field. This is followed by a simple text field (*Homepage*), and the **[+]** and **[-]** icons also represent button form controls that are assigned specific actions to add or delete records from the document.

Figure 221. Example of Form Controls in Author Mode



You can use your imagination to envision the multitude of ways that you can use form controls to make the editing experience for content authors easier and more efficient. As a working example, a bundled *samples* project (located in the `samples` folder inside the Oxygen XML Editor installation directory) contains a file called `personal.xml` that contains form controls. You can use this file, along with its corresponding

`personal.css` file to experiment with an example of how form controls can be implemented in **Author** mode.

Related Information:
Form Controls *(on page 2491)*

Contextual Menu Actions in Author Mode

Oxygen XML Editor includes powerful support for editing XML documents through actions included in the contextual menu. When editing XML documents in **Author** mode, the contextual menu includes *general* actions that are available for all of the recognized document types and *framework (on page 3420)*-specific actions that are configured for each document type.

General Contextual Menu Actions in Author Mode

The *general* actions that are available in the contextual menu (some of them are also available in the submenus of the **Document** menu) for all built-in document types include the following:

Add File to Review Task

This action can be used to add the current document to a task in the **Content Fusion Tasks Manager** view. **Oxygen Content Fusion** is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on *(on page 2651)*. To fully take advantage of all of the benefits and features of **Content Fusion**, your organization will need an **Oxygen Content Fusion Enterprise Server**. For more information, see the **Oxygen Content Fusion** website.

Quick Fix (Alt + 1 (Command + Option + 1 on macOS))

Available when the contextual menu is invoked on an error where Oxygen XML Editor can provide a *Quick Fix (on page 824)*.

Open Image

Available when the contextual menu is invoked on an image. This action allows you to open an image in the Oxygen XML Editor Image Viewer *(on page 479)* or in a default system application associated with the current image type.

Show in Explorer (Show in Finder on macOS)

Available when the contextual menu is invoked on an image. This action allows you to open the parent directory of an image in the system file explorer, and it selects the image file.

Save image as

Available when the contextual menu is invoked on a local, external, or embedded image. This action opens a dialog box where you can choose a location in the local file system where the image will be saved. It also includes an option (**Update the reference to the image**) that can be toggled to choose whether or not to update the path in existing references to the image.

Track Changes Actions

Available when the *Track Changes* feature *(on page 3424)* is enabled and the contextual menu is invoked on a change. The following options are available:

Accept Change(s)

Accepts the *Tracked Change (on page 3424)* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

Reject Change(s)

Rejects the *Tracked Change (on page 3424)* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 3424)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Author Callout Actions

Available when the contextual menu is invoked on a *callout (on page 3418)*. If the corresponding options in the **Show review callouts** section *(on page 194)* are selected in the **Callouts** preferences page *(on page 194)*, the callouts are displayed in **Author** mode for comments, tracked insertions, or tracked deletions.

Insertion or Deletion Callout Actions

The following actions are available in the contextual menu when invoked on an *insertion* or *deletion* callout box:

Reply

Opens a dialog box that allows you to add a reply to a comment or *Tracked Changes (on page 3424)*. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view *(on page 675)*.

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for *Tracked Changes (on page 3424)* that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Accept Change(s)

Accepts the *Tracked Change (on page 3424)* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

Reject Change(s)

Rejects the *Tracked Change (on page 3424)* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 3424)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

Callouts Options

Select this option to open the **Callouts** preference page *(on page 194)* where you can configure various callout options.

Comment Callout Actions

The following actions are available in the contextual menu when invoked on a *comment* callout box:

Reply

Opens a dialog box that allows you to add a reply to a comment or *Tracked Changes (on page 3424)*. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view *(on page 675)*.

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for *Tracked Changes (on page 3424)* that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

 **Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

 **Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

 **Callouts Options**

Select this option to open the **Callouts** preference page *(on page 194)* where you can configure various callout options.

 **Edit Attributes**

Displays an in-place attributes editor *(on page 640)* that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the profiling attributes *(on page 680)* defined on all selected elements.

Insert submenu

This submenu includes insert actions that are specific to each *framework (on page 3420)*, along with the following general action:

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- #<*decimal value*> - e. g. #65
- &#<*decimal value*>; - e. g. &#65
- #x<*hexadecimal value*> - e. g. #x41
- &#x<*hexadecimal value*>; - e. g. &#x41

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes special paste actions that are specific to each *framework (on page 3420)*, as well as the following general paste actions:

Paste As XML

Pastes clipboard content that is considered to be XML, preserving its XML structure.

Paste As Text (Ctrl + Shift + V (Command + Shift + V on macOS))

Pastes clipboard content, ignoring any structure or styling markup.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word. 0034

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

> **Note:**
> The content marked as deleted with *change tracking (on page 3424)* is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character *(on page 473)*. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `E`
- `0X0125` to `ĥ`
- `265` to `ŉ`
- `2190` to `←`

> **Note:**
> For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent *(on page 476)*.

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

Toggle Comment

Encloses the currently selected text in a comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

Split Element (Alt + Shift + D (Ctrl + Option + D on macOS))

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent *block elements (on page 3417)* that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Ctrl + E (Command + E on macOS))

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option *(on page 220)* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option *(on page 220)* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on macOS))

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

DITA-related Refactoring Actions

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

Change Topic ID to File Name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS Tables to Simple Tables

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert conrefs to conkeyrefs

Use this operation to convert `@conref` attributes to `@conkeyref` attributes.

Convert Simple Tables to CALS Tables

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

JATSKit Refactoring Actions

Available for JATS documents. Contains built-in XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

Processing Instructions Refactoring Actions

Contains built-in XML refactoring operations that pertain to processing instructions.

Accept all tracked changes, remove all Oxygen-specific comments and highlights

Use this operation to accept all application-specific tracked changes (from elements and attributes) or remove all application-specific comments or highlights.

Delete processing instructions

Deletes the detected processing instructions.

Review submenu

This submenu includes the following actions:

 **Track Changes**

Enables or disables the *Track Changes (on page 3424)* support for the current document.

 **Accept Change(s) and Move to Next**

Accepts the *Tracked Change (on page 3424)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

 **Accept All Changes**

Accepts all *Tracked Changes (on page 3424)* in the current document.

 **Reject Change(s) and Move to Next**

Rejects the *Tracked Change (on page 3424)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

 **Reject All Changes**

Rejects all *Tracked Changes (on page 3424)* in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 3424)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the **Review** view *(on page 675)*.

Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. It includes the following actions:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** *(on page 843)* dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the **Select the scope for the Search and Refactor operations** *(on page 843)*.

 **Search Occurrences in file**

Searches for the occurrences of the ID in the current document.

Folding submenu

This submenu includes the following actions:

 **Toggle Fold**

Toggles the state of the current fold.

 **Collapse Other Folds**

Folds all the elements except the current element.

 **Collapse Child Folds**

Folds the elements indented with one level inside the current element.

 **Expand Child Folds**

Unfolds all child elements of the currently selected element.

 **Expand All**

Unfolds all elements in the current document.

Inspect Styles

Opens the **CSS Inspector** view *(on page 651)* that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page *(on page 183)*.

Document Type-Specific Contextual Menu Actions in Author Mode

Other *document type-specific* actions are available in the contextual menu of **Author** mode for the following document types (click the links to see the default actions that are available for each specific document type):

- **DocBook4** Author Actions *(on page 1329)*
- **DocBook5** Author Actions *(on page 1350)*
- **DITA** Author Actions *(on page 3180)*
- **DITA Map** Author Actions *(on page 3124)*

- **XHTML** Author Actions *(on page 1412)*
- **TEI ODD** Author Actions *(on page 1438)*
- **TEI P5** Author Actions *(on page 1425)*
- **JATS** Author Actions *(on page 1451)*

Validating XML Documents

The W3C XML specification states that a program should not continue to process an XML document if it finds a validation error. The reason is that XML software should be easy to write and all XML documents should be compatible. With HTML, for example, it is possible to create documents with lots of errors (for instance, when you forget an end tag). One of the main reasons that various HTML browsers have performance and compatibility problems is that they have different methods of figuring out how to render a document when an HTML error is encountered. Using XML helps to eliminate such problems.

Even when creating XML documents, errors are easily introduced. When working with large projects or a large number of files, the probability that errors will occur is even greater. Preventing and solving errors in your projects can be time consuming and frustrating. Fortunately, Oxygen XML Editor provides validation functions that allow you to easily identify errors and their location.

Modular Contextual XML Editing Using 'Main Files' Support *(on page 841)*

Checking XML Well-Formedness

A *Well-formed XML* document is a document that conforms to the XML syntax rules. A *Namespace Well-Formed XML* document is a document that is *Well-formed XML* and is also *Namespace-wellformed* and *Namespace-valid*.

Well-Formedness Rules

The XML Syntax rules for *Well-formed XML* include:

- All XML elements must have a closing tag.
- XML tags are case-sensitive.
- All XML elements must be properly nested.
- All XML documents must have a root element.
- Attribute values must always be quoted.
- With XML, whitespace is preserved.

The *Namespace-wellformed* rules include:

- All element and attribute names contain either zero or one colon.
- No entity names, processing instruction targets, or notation names contain any colons.

The *Namespace-valid* rules include:

- The *xml* prefix is by definition bound to the namespace name: *http://www.w3.org/XML/1998/namespace*. It MAY be declared, but MUST NOT be undeclared or bound to any other namespace name. Other prefixes MUST NOT be bound to this namespace name.
- The *xmlns* prefix is used only to declare namespace bindings and is by definition bound to the namespace name: *http://www.w3.org/2000/xmlns/*. It MUST NOT be declared or undeclared. Other prefixes MUST NOT be bound to this namespace name.
- All other prefixes beginning with the three-letter sequence *x*, *m*, *l*, in any case combination, are reserved. This means that users SHOULD NOT use them except as defined by later specifications and processors MUST NOT treat them as fatal errors.
- The namespace prefix (unless it is *xml* or *xmlns*) MUST have been declared in a namespace declaration attribute in either the start tag of the element where the prefix is used or in an ancestor element (for example, an element in whose content the prefixed markup occurs). Furthermore, the attribute value in the innermost such declaration MUST NOT be an empty string.

Check for Well-Formedness

To check if a document is *Namespace Well-Formed XML* and *Namespace-valid*:

- Select the **Check Well-Formedness (Ctrl + Shift + W (Command + Shift + W on macOS))** action from the **Validation** drop-down menu on the toolbar (or the **Document > Validate** menu).
- A selection of files can be checked for well-formedness by selecting the **Check Well-Formedness** action from the **Validate** submenu when invoking the contextual menu in the **Project** view *(on page 413)*.

Result: If any errors are found, the result is displayed in the message panel at the bottom of the editor. Each error is displayed as one record in the result list and is accompanied by an error message. Clicking the record will open the document containing the error and highlight its approximate location.

Example: A non *Well-formed XML* Document

```
<root><tag></root>
```

When the **Check Well-Formedness** action is performed, the following error is displayed:

```
The element type "tag" must be terminated by the matching end-tag "</tag>"
```

To resolve the error, click the record in the resulting list and it will locate and highlight the approximate position of the error. In this case, identify the tag that is missing an end tag and insert </tag>.

Example: A non *Namespace-wellformed* Document

```
<prefix:elem></prefix:elem>
```

When the **Check Well-Formedness** action is performed, the following error is displayed:

```
The prefix "prefix" for element "prefix:elem" is not bound.
```

Example: A non *Namespace-valid* Document

```
<x:y></x:y>
```

When the **Check Well-Formedness** action is performed, the following error is displayed:

```
The prefix "x" for element "x:y" is not bound.
```

Validating XML Documents Against a Schema

A *Valid* XML document is a *Well-Formed* XML document that also conforms to the rules of a schema that defines the legal elements of an XML document. The schema type can be: XML Schema, Relax NG (full or compact syntax), Schematron, Document Type Definition (DTD), or Namespace-based Validation Dispatching Language (NVDL).

The purpose of the schema is to define the legal building blocks of an XML document. It defines the document structure with a list of legal elements.

This section contains topics that explain the automatic and manual validation possibilities in Oxygen XML Editor, how validation errors are presented, and information about built-in and custom validation scenarios.

For information about how to associate a schema for the purposes of validation (and content completion), see the Associating a Schema to XML Documents *(on page 827)* section.

Automatic Validation

By default, Oxygen XML Editor automatically checks for validation errors as you are editing a document. The **Enable automatic validation** option *(on page 235)* in the **Document Checking** preferences page *(on page 235)* controls whether or not all validation errors and warnings will automatically be highlighted in the editor panel.

The automatic validation starts parsing the document and marking the errors after a configurable delay *(on page 235)* from the last key typed. Errors are highlighted with underline markers in the main editor panel and small rectangles on the right side ruler of the editor panel. Hovering over a validation error presents a tooltip message with more details about the error.

If the error message is long and it is not displayed completely in the error line at the bottom of the editing area, double-clicking the error icon at the left of the error line or on the error line displays an information dialog box with the full error message. You can use the arrow buttons in this dialog box to navigate through the errors issued by the Automatic Validation feature.

Manual Validation Actions *(on page 786)*
Presenting Validation Errors in Text Mode *(on page 788)*
Presenting Validation Errors in Author Mode *(on page 791)*

Manual Validation Actions

You can choose to validate documents at any time by using the manual validation actions that are available in Oxygen XML Editor.

Tip:
Status information generated by certain operations (such as *validation*) are fed into the **Information** view. This could be helpful for troubleshooting problems encountered during such operations. To open this view, select **Window > Show View > Information**.

Manual Validation Actions

To manually validate the currently edited document, use one of the following actions:

Validate

Available from the **Validation** drop-down menu on the toolbar, the **Document > Validate** menu, or from the **Validate** submenu when invoking the contextual menu in the **Project** view *(on page 413)*.

An error list is presented in the message panel at the bottom of the editor. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules. This action also re-parses the *XML Catalogs (on page 3425)* and resets the schema used for content completion.

Validate (cached)

Available from the **Validation** drop-down menu on the toolbar or the **Document > Validate** menu.

This action caches the schema, allowing it to be reused for the next validation. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules.

Note:
Automatic validation also caches the associated schema.

Validate with

Available from the **Validation** drop-down menu on the toolbar, (or **Document > Validate** menu).

This action opens a dialog box that allows you to specify a schema for validating the current document *(on page 831)*.

You can use this action to validate the current document using a schema of your choice (XML Schema, DTD, Relax NG, NVDL, Schematron schema), other than the associated one. An error list is presented in the message panel at the bottom of the editor. Markup of current document is checked to conform with the specified schema rules.

Note:
The **Validate with** action does not work for files loaded through a custom protocol plugin *(on page 2546)* developed independently and added to Oxygen XML Editor after installation.

Validate with Schema

Available from the **Validate** submenu when invoking contextual menu in the **Project** view *(on page 413)*.

This action opens a dialog box that allows you to specify a schema for validating all selected files *(on page 832)*.

Other Validation Options

To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

The  **Validation options** button, available in the **Document > Validate** menu, allows you to quickly access to the validation options *(on page 246)* for the built-in validator in the Oxygen XML Editor preferences page.

Tip:
If a large number of validation errors are detected and the validation process takes too long, you can limit the maximum number of reported errors in the **Document Checking** preferences page *(on page 235)*.

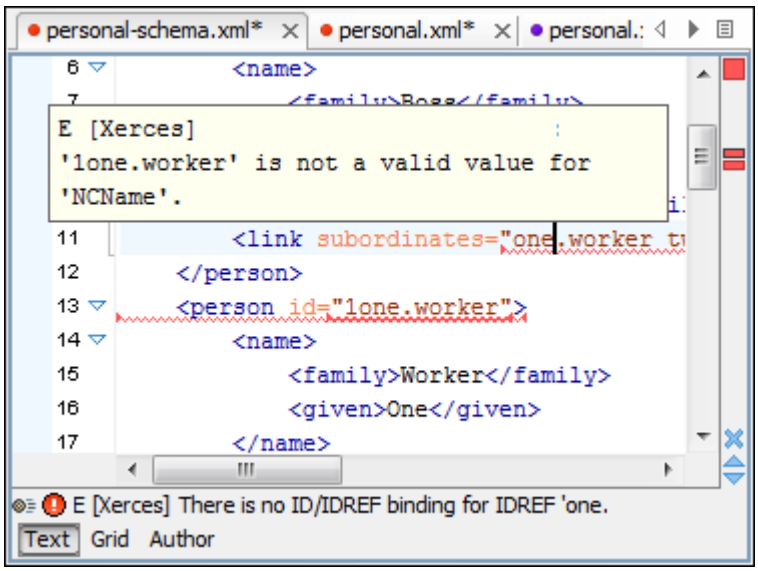
Presenting Validation Errors in Text Mode

By default, Oxygen XML Editor automatically validates documents *(on page 786)* while editing in the **Text** mode, and actions are also available to manually validate documents *(on page 786)* on-request.

Figure 222. Presenting Validation Errors in Text Mode



Validation Marker Locations

In **Text** mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the **Attributes** view *(on page 552)*, with the attribute and its value colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

You can configure the color for each type in the **Document Checking** preferences page *(on page 235)*.

Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

Upper Part of the Stripe

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More

details about the issues are displayed in a tooltip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tooltip.

Middle Part of the Stripe

Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights** option *(on page 235)*.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tooltip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the **Document Checking** preferences page *(on page 235)*.

Bottom Part of the Stripe

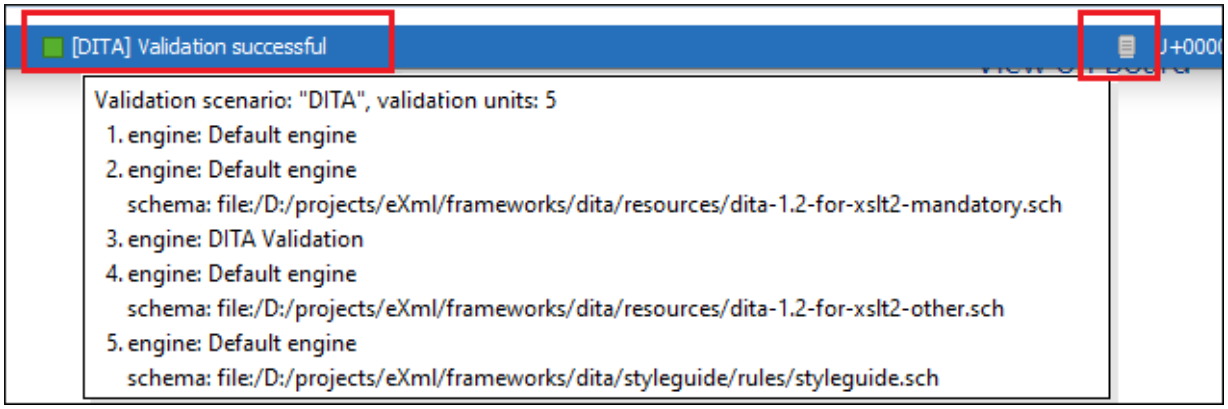
Two navigation arrows ( ) can be used to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next Error/Highlight** (**Ctrl + Period (Command + Period on macOS)**) and **Document > Automatic validation > Previous Error/ Highlight** (**Ctrl + Comma (Command + Comma on macOS)**). Also, the **Remove All** button can be used to clear all the validation markers.

Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem and possible *quick fixes (on page 824)* (if available for that issue). Also, when hovering over an issue, pressing **F2** will change the focus to the tooltip where you can use **Tab** and **Shift + Tab** to navigate between quick fixes and **Space** to trigger them.

Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the **Document Checking** preferences page *(on page 235)* where you can configure some validation options (such as the colors used to present the validation issues). Some validation messages have an icon ( ) and clicking it opens a dialog box with additional information and a link to specifications.
- When a validation is processed, information about the validation scenario is displayed in the stripe at the very bottom of the application. It includes the name of the validation scenario and its status. If you hover over the information, a tooltip is presented with more information. You can also click the button to open the **Information** view *(on page 522)*, where even more details are displayed.



- If you want to see all the validation messages grouped in the **Results** view *(on page 558)* view, use the **Validate** action from the toolbar or **Document > Validate** menu. To see more information about a validation message, right-click the item in the **Results** view and select **Show message**. Some validation messages have an icon () in the **Info** column and clicking it opens a dialog box with additional information and a link to specifications.

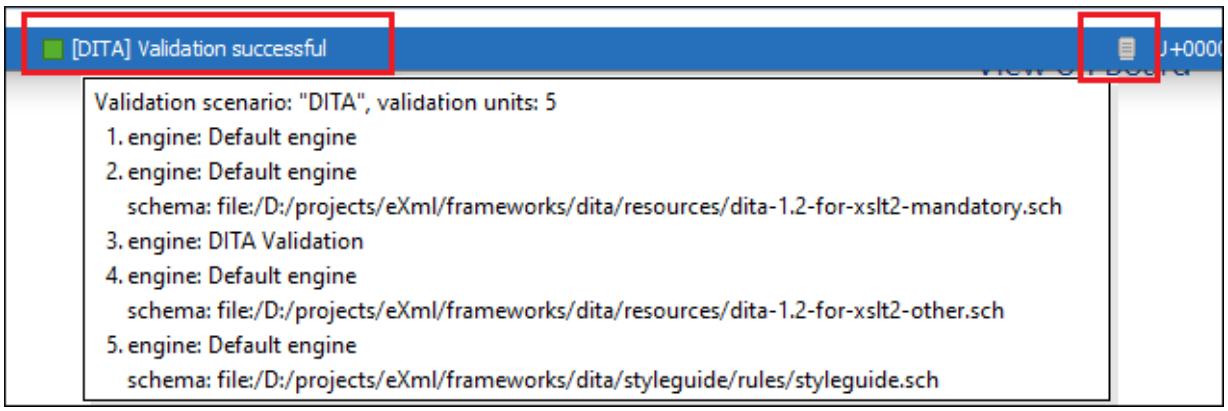
Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the **Document Checking** preferences page *(on page 235)* where you can configure some validation options (such as the colors used to present the validation issues). Some validation messages have an icon () and clicking it opens a dialog box with additional information and a link to specifications.
- When a validation is processed, information about the validation scenario is displayed in the stripe at the very bottom of the application. It includes the name of the validation scenario and the status. If you hover over the information, a tooltip is presented with more information. You can also click the button to open the **Information** view *(on page 522)*, where even more details are displayed.



- If you want to see all the validation messages grouped in the **Results** view *(on page 558)* view, use the **Validate** action from the toolbar or **Document > Validate** menu. To see more information about a validation message, right-click the item in the **Results** view and select **Show message**. Some validation messages have an icon () in the **Info** column and clicking it opens a dialog box with additional information and a link to specifications.

Related Information:

Validating XML Documents Against a Schema *(on page 786)*

Presenting Schematron Validation Issues *(on page 1241)*

Customizing Assert Error Messages

To customize the error messages that the Xerces or Saxon validation engines display for the `<assert>` and `<assertion>` elements, set the `@message` attribute on these elements.

- For Xerces, the `@message` attribute has to belong to the `http://xerces.apache.org` namespace.
- For Saxon, the `@message` attribute has to belong to the `http://saxon.sf.net/` namespace.

The value of the `@message` attribute is the error message displayed if the assertion fails.

Custom Validators

If you need to validate the edited document with a validation engine that is different from the built-in engine, you can configure external validators in the Custom Validation Engines preferences page *(on page 236)*. After a custom validation engine is properly configured *(on page 236)*, it can be applied on the current document by selecting it from the list of custom validation engines in the  **Validation** toolbar drop-down menu. The document is validated against the schema declared in the document.

Some validators are configured by default but there are third-party processors that do not support the output message format *(on page 795)* of Oxygen XML Editor for linked messages:

- **Saxon-EE** - Included in Oxygen XML Editor. It is associated to XML Editor and XSD Editor. It is able to validate XML Schema schemas and XML documents against XML Schema schemas. The validation is done according to the W3C XML Schema 1.0 or 1.1. This can be configured in Preferences *(on page 247)*.
- **MSXML 4.0 (Legacy)** - Included in Oxygen XML Editor (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **MSXML.NET (Legacy)** - Included in Oxygen XML Editor (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **LIBXML** - Not included in Oxygen XML Editor and, depending on your operating system, the libraries need to be downloaded and installed separately from http://xmlsoft.org/downloads.html. Afterward, the `PATH` environment variable needs to be updated to contain the parent folder of the `xmllint` executable. Alternatively, you can go to **Options > Preferences > Editor > Custom Validation Engines**, edit the **LIBXML** validation engine and set a custom path to the `xmllint` executable.

  The LIBXML validator is associated with the XML Editor. It is able to validate the edited document against XML Schema, Relax NG schema full syntax, internal DTD (included in the XML document) or a custom schema type. Support for *XML Catalogs (on page 3425)* (the `--catalogs` parameter) and XInclude processing (`--xinclude`) are enabled by default in the preconfigured LIBXML validator. The `--postvalid` parameter is also set by default and it allows LIBXML to validate correctly the main document even if the XInclude fragments contain IDREFS to ID's located in other fragments.

For validation against an external DTD specified by URI in the XML document, add the `--dtdvalid ${ds}` parameter manually to the DTD validation command line. `${ds}` represents the detected DTD declaration in the XML document.

CAUTION:
File paths containing spaces are not handled correctly in the LIBXML processor. For example, the built-in *XML Catalog (on page 3425)* files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled by LIBXML if Oxygen XML Editor is installed in the default location on Windows (`C:\Program Files`) because the built-in *XML catalog* files are stored in the `frameworks` subfolder of the installation folder and in this case, the file path contains at least one space character.

Attention:
On macOS, if the full path to the LIBXML executable file is not specified in the **Executable path** text field, some errors may occur during validation against a W3C XML Schema, such as:

```
Unimplemented block at ... xmlschema.c
```

To avoid these errors, specify the full path to the LIBXML executable file.

A custom validator cannot be applied on files loaded through an Oxygen XML Editor custom protocol plugin *(on page 2546)* developed independently and added to Oxygen XML Editor after installation.

Linked Output Messages of an External Engine

Validation engines display messages in an output view at the bottom of the Oxygen XML Editor window. If such an output message (**warning**, **error**, **fatal error**, etc) spans between three to six lines of text and has the format specified below, then the message is linked to a location in the validated document. Clicking the message in the output view highlights the location of the message in an editor panel containing the file referenced in the message. This behavior is similar to the linked messages generated by the default built-in validator.

Linked messages have the following format:

- **Type**: [F|E|W] (the string *Type:* followed by a letter for the type of the message: fatal error, error, warning). This property is optional in a linked message.
- **SystemID**: A system ID of a file (the string `SystemID:` followed by the system ID of the file that will be opened for highlighting when the message is clicked in the output message - usually the validated file, the schema file or an included file).
- **Line**: A line number (the string *Line:* followed by the number of the line that will be highlighted).
- **Column**: A column number (the string *Column:* followed by the number of the column where the highlight will start on the highlighted line). This property is optional in a linked message.

- **EndLine**: A line number (the string **EndLine**: followed by the number of the line where the highlight ends). This property is optional in a linked message.
- **EndColumn**: A column number (the string **EndColumn**: followed by the number of the column where the highlight ends on the end line). This property is optional in a linked message.

> **Note:**
> The **Line**/**Column** pair works in conjunction with the **EndLine**/**EndColumn** pair. Thus, if both pairs are specified, then the highlight starts at **Line**/**Column** and ends at **EndLine**/**EndColumn**. If the **EndLine**/**EndColumn** pair is missing, the highlight starts from the beginning of the line identified by the **Line** parameter and ends at the column identified by the **Column** parameter.

- **AdditionalInfoURL**: The URL string pointing to a remote location where additional information about the error can be found - this line is optional in a linked message.
- **Description**: Message content (the string *Description:* followed by the content of the message that will be displayed in the output view).

Example:

Example of how a custom validation engine can report an error using the format specified above:

```
Type: E
SystemID: file:///c:/path/to/validatedFile.xml
Line: 10
Column: 20
EndLine: 10
EndColumn: 35
AdditionalInfoURL: http://www.host.com/path/to/errors.html#errorID
Description: custom validator message
```

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Editor, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends `net.sf.saxon.lib.ExtensionFunctionDefinition`. Here is an example:

```
private static class ShiftLeft extends ExtensionFunctionDefinition {
  @Override
  public StructuredQName getFunctionQName() {
    return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
  }
```

```
  @Override
  public SequenceType[] getArgumentTypes() {
    return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
  }

  @Override
  public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
    return SequenceType.SINGLE_INTEGER;
  }

  @Override
  public ExtensionFunctionCall makeCallExpression() {
    return new ExtensionFunctionCall() {
      public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)
                    throws XPathException {
        long v0 = ((IntegerValue)arguments[0].next()).longValue();
        long v1 = ((IntegerValue)arguments[1].next()).longValue();
        long result = v0<<v1;
        return Value.asIterator(Int64Value.makeIntegerValue(result));
      }
    };
  }
}
```

2. Compile the class and add it to a JAR file.
3. Add a file called **net.sf.saxon.lib.ExtensionFunctionDefinition** that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

Note:
To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.

To enable Oxygen XML Editor to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the **Classpath** tab *(on page 152)*.
- In a validation scenario *(on page 799)*, you can use the **Extensions** button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the **Extensions** button in the **XSLT** tab *(on page 1506)* to open a dialog box where you can add libraries.
- You can also create a plugin that contributes such a JAR file in the classpath *(on page 2530)*.

Validation Scenarios

A complex XML document is split in smaller interrelated modules. These modules do not make much sense individually and cannot be validated in isolation due to interdependencies with other modules. Oxygen XML Editor validates the main module of the document when an imported module is checked for errors.

A typical example is the chunking of a DocBook XSL stylesheet that has `chunk.xsl` as the main module and `param.xsl`, `chunk-common.xsl`, and `chunk-code.xsl` as imported modules. `param.xsl` only defines XSLT parameters. The module `chunk-common.xsl` defines an XSLT template with the name `chunk`. `Chunk-code.xsl` calls this template. The parameters defined in `param.xsl` are used in the other modules without being redefined.

Validating `chunk-code.xsl` as an individual XSLT stylesheet generates misleading errors regarding parameters and templates that are used but undefined. These errors are only caused by ignoring the context in which this module is used in real XSLT transformations and validations. To validate such a module, define a validation scenario to set the main module of the stylesheet and the validation engine used to find the errors. Usually this engine applies the transformation during the validation process to detect the errors that the transformation generates.

You can validate a stylesheet with several engines to make sure that you can use it in various environments and have the same results. For example, an XSLT stylesheet may be applied with Saxon 12 or Saxon 6.5 engines in different production systems.

Other examples of documents that can benefit from a validation scenario include:

- A complex XQuery file with a main module that imports modules developed independently but validated in the context of the main module of the query. In an XQuery validation scenario, the default validator of Oxygen XML Editor (Saxon 12) or any connection to a database that supports validation (eXist XML Database, MarkLogic version 5 or newer) can be set as a validation engine.
- An XML document where the *main file* *(on page 3421)* includes smaller fragment files using XML entity references.

Note:
If a *main file* is associated with the current file, the validation scenarios defined in the *main file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *main files*, see Contextual Project Operations Using 'Main Files' Support *(on page 428)* or Modular Contextual XML Editing Using 'Main Files' Support *(on page 841)*.

Tip:
Status information generated by certain operations (such as *validation*) are fed into the **Information** view. This could be helpful for troubleshooting problems encountered during such operations. To open this view, select **Window > Show View > Information**.

Related information

Validating XML Documents Against a Schema *(on page 786)*
Presenting Validation Errors in Author Mode *(on page 791)*
Presenting Validation Errors in Text Mode *(on page 788)*

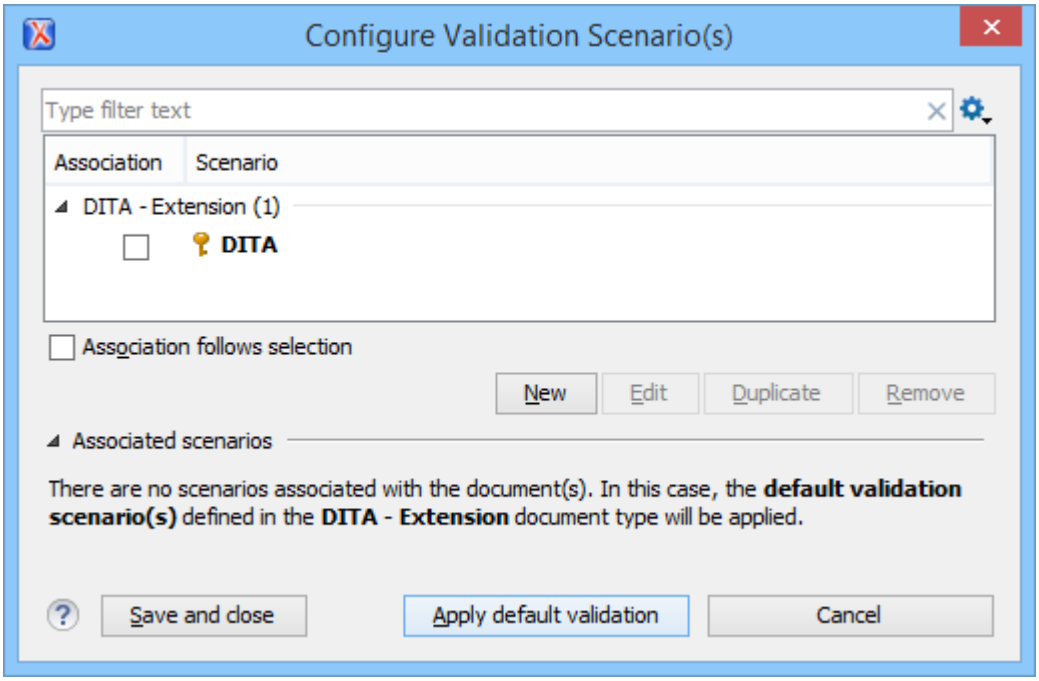
Creating a New Validation Scenario

To create a validation scenario, follow these steps:

1. Select the **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project** view *(on page 413)*).
   The **Configure Validation Scenario(s)** dialog box is displayed. It contains built-in and user-defined scenarios. The built-in scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular *framework (on page 3420)* are rendered in bold.

   Note:
   If a *main file* is associated with the current file, the validation scenarios defined in the *main file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *main files*, see Contextual Project Operations Using 'Main Files' Support *(on page 428)* or Modular Contextual XML Editing Using 'Main Files' Support *(on page 841)*.

Figure 224. Configure Validation Scenario Dialog Box



The top section of the dialog box contains a filter that allows you to search through the scenarios list and the **Settings** button allows you to configure the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

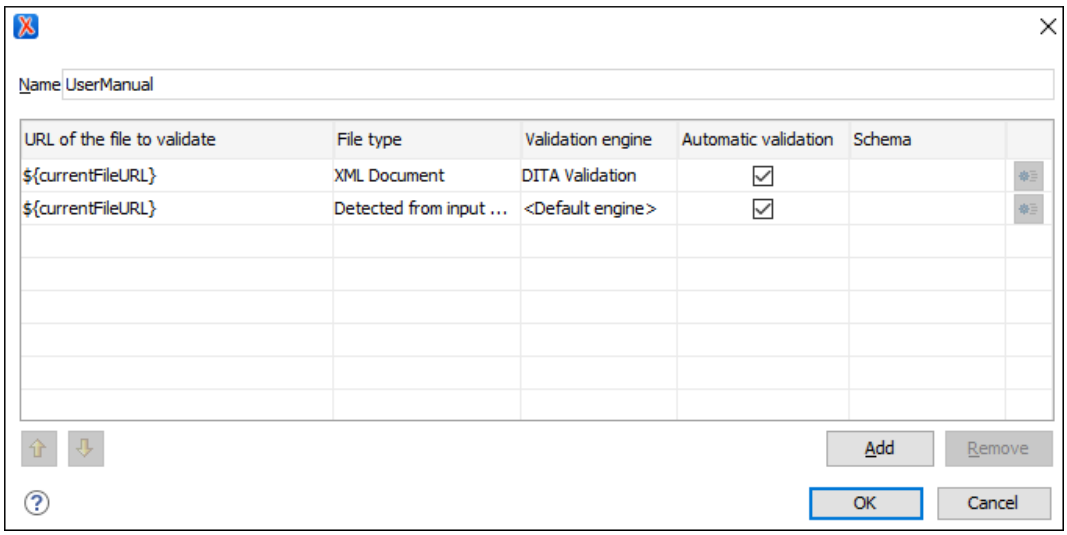
> **Note:**
> When you keep both scenarios, Oxygen XML Editor adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor creates a `scenarios` file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

2. To add a scenario, click the **New** button.
   A validation scenario configuration dialog box is displayed and it lists all the validation units for the scenario.

Figure 225. Validation Scenario Configuration Dialog Box



This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

Storage

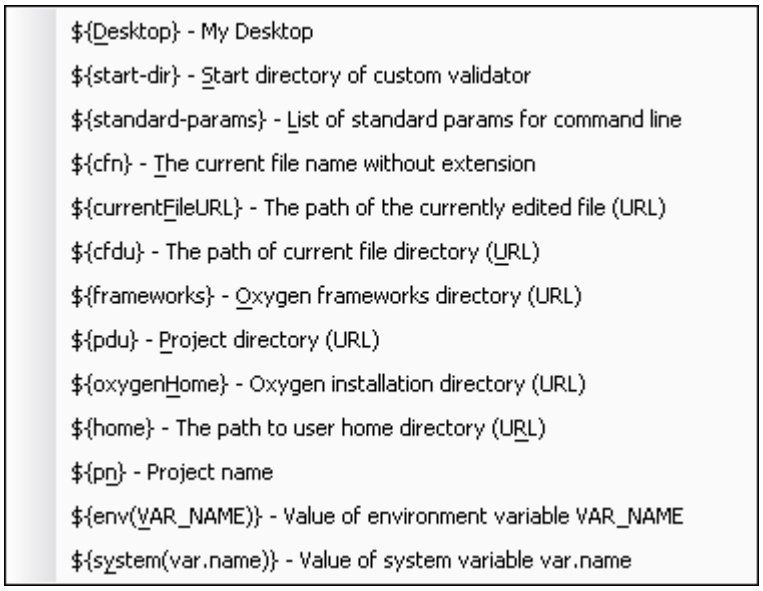
You can choose between storing the scenario in the **Project Options** *(on page 3423)* or **Global Options** *(on page 3420)*.

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an editor variable *(on page 332)* or a custom editor variable *(on page 342)*.

Figure 226. Insert an Editor Variable



File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can select one of the engines available in Oxygen XML Editor for validation of the particular document type:

- **Default engine** - The default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page *(on page 254)*, XQuery preferences page *(on page 262)*, XML Schema preferences page *(on page 247)*).
- **DITA Validation** engine - Performs DITA-specific checks in the context of the specifications (it is similar to the process when using the **Validate and Check for Completeness** action *(on page 3118)* in the **DITA Maps Manager**, but for a local file rather than an entire *DITA map (on page 3419)*).
- **DITA Map Validation and Completeness Check** engine - Performs a validation process that checks the DITA map document and all referenced topics and maps (it is similar to the process when using the **Validate and Check for Completeness** action *(on page 3118)* in the **DITA Maps Manager**).

- **DITA-OT Project Validation and Completeness Check** engine - Performs a validation process that checks each context from the provided DITA-OT project file (it is similar to the process when using the **Validate and Check for Completeness** action *(on page 3118)* in the **DITA Maps Manager**).
- **Table Layout Validation** engine - Looks for table layout problems (for more information, see the Report table layout problems option *(on page 3123)*).

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature *(on page 786)*. If the **Automatic validation** feature is disabled in the Document Checking preferences page *(on page 235)*, then this option is ignored, as the preference setting has a higher priority.

Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

Settings

Depending on the selected validation engine, clicking the **Settings** button either opens the **Specify Schema** dialog box or the **Configure validation engine** dialog box.

- **Specify Schema Dialog Box**

  This dialog box allows you to specify a custom schema to be used for the validation process.

  Figure 227. Specify Schema Dialog Box

  
  The **Specify Schema** dialog box contains the following options:

  Use detected schema

  Uses the schema detected for the particular document *(on page 828)*.

  Use custom schema

Allows you to specify the schema using the following options:

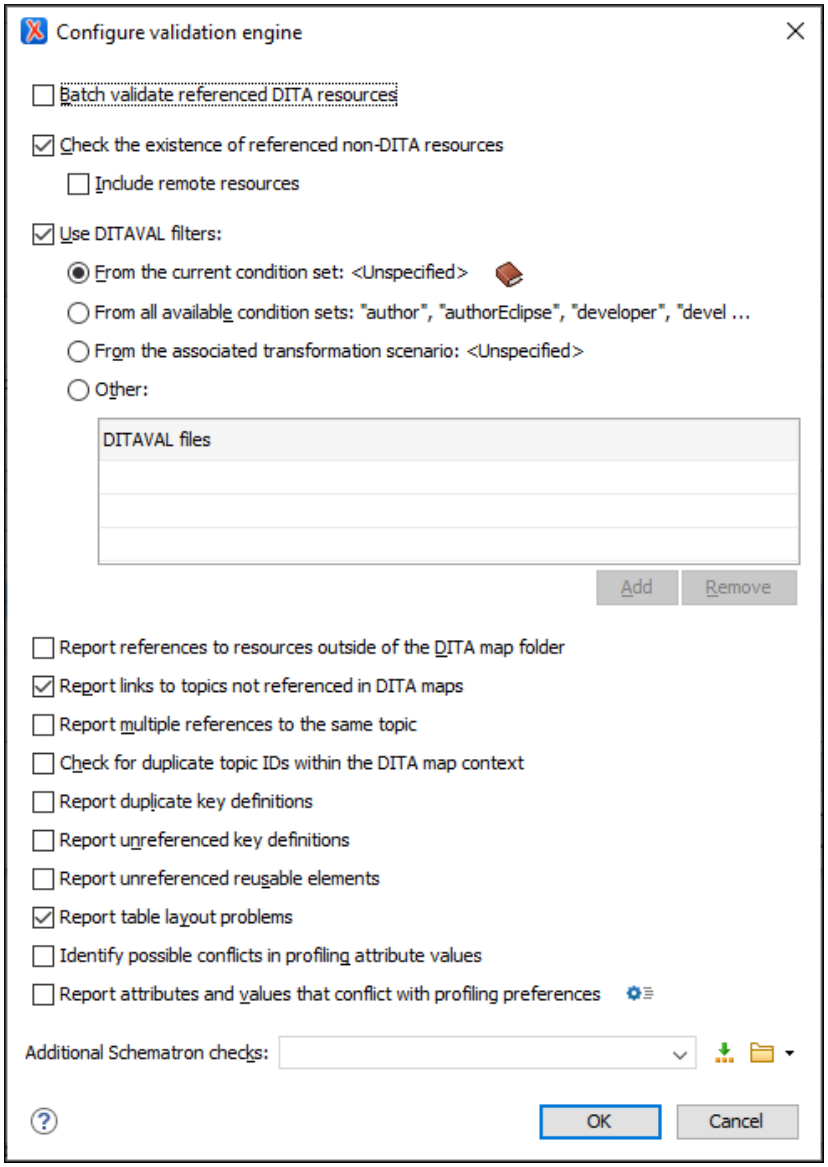
- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(on page 2563)*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (on page 3420)* to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

◦ **Configure Validation Engine Dialog Box**

This dialog box allows you to configure options for checking the DITA map document and all referenced topics and maps (similar to the process done when using the **Validate and Check for Completeness** action *(on page 3118)* in the **DITA Maps Manager**).

> **Note:**
> The options presented in the **Configure validation engine** dialog box depends on type of validation engine. For example, when configuring the **DITA-OT Project Validation and Completeness Check** validation engine, the dialog box has slightly fewer options (omitting those that are not applicable).

Figure 228. Example of the Configure Validation Engine Dialog Box



The **Configure Validation Engine** dialog box contains the following options:

Batch validate referenced DITA resources

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario *(on page 798)*.

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the **DITA Maps Manager** view *(on page 3073)*. Clicking the **Details** icon opens a topic in the Oxygen XML Editor User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the *DITA map*.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the **Add** or **Remove** buttons to configure the list. The **Add** button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the *main DITA map (on page 3424)* folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the *DITA map*. Also reports related links defined in relationship tables whose target topics are not referenced in the DITA Map.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the *DITA map*, unless a unique `@copy-to` attribute is used on the `<topicref>` element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second `<topicref>` has a `@copy-to` attribute set:

```
<topicref href="topic.dita"/>
.....
 <topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a `@copy-to` attribute set or both of them have the `@copy-to` attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita"/>
......
 <topicref href="topic.dita" copy-to="topic2.dita"/>
```

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the *DITA map* for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `@keys` attribute, all references will point to the first one encountered and the other will be ignored.

Note:

This option takes *key scopes (on page 3239)* into account. For example, if you have something like this:

```
<topicref href="t2.dita" keys="k2"/>
    <topicgroup keyscope="ks">
        <topicref href="t2.dita" keys="k2"/>
    </topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a *key scope (on page 3239)* on the second occurrence.

Report unreferenced key definitions

Checks the entire *DITA map* and reports any key definitions that are not referenced anywhere. Note that if the **Use DITAVAL filters** option is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire *DITA map* and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an *ID* specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to **resource-only**.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a *CALS* table, if a cell has a vertical span greater than the available rows count.
- For a *CALS* table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a *CALS* table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a *CALS* table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a *CALS* table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the **Profiling / Conditional Text** preferences page *(on page 195)* (you can click the **Profiling Preferences** button to open this preferences page). It also checks if profiling attributes defined as *single-value* have multiple values set in the searched topics.

Additional Schematron checks

Allows you to select a Schematron file that Oxygen XML Editor will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.

Advanced Tip:
Some APIs are available that retrieve information about DITA keys that are referenced within a topic. The APIs can be called from XSLT Stylesheets (including XML Refactoring operations) or Schematron schemas. For details, see API Documentation: DITAXSLTExtensionFunctionUtil.

Move Up

Moves the selected validation unit up one spot in the list.

Move Down

Moves the selected validation unit down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the **validation phase**.
4. Click **OK**.
   The newly created validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current document and click the **Apply associated** button to run the validation scenario.

Editing a Validation Scenario

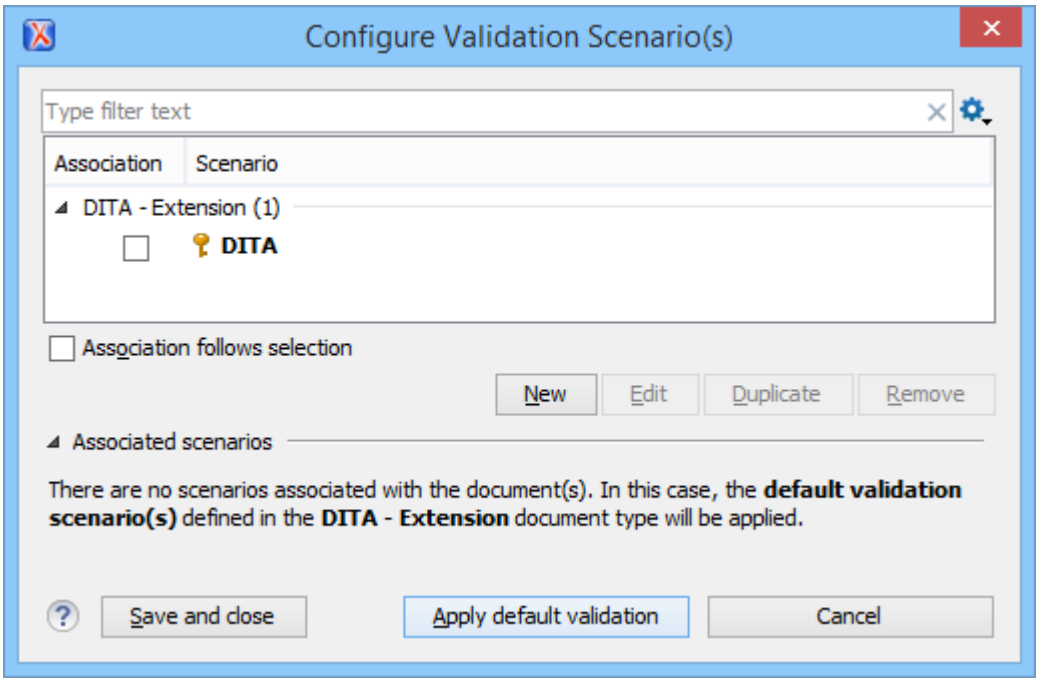
To edit an existing validation scenario, follow these steps:

1. Select the  **Configure Validation Scenario(s)** from the  **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project** view *(on page 413)*).
   The **Configure Validation Scenario(s)** dialog box is displayed. It contains built-in and user-defined scenarios. The built-in scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular *framework (on page 3420)* are rendered in bold.

Note:
If a *main file* is associated with the current file, the validation scenarios defined in the *main file*, along with any Schematron schema defined in the default scenarios for that particular

framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *main files*, see Contextual Project Operations Using 'Main Files' Support *(on page 428)* or Modular Contextual XML Editing Using 'Main Files' Support *(on page 841)*.

Figure 229. Configure Validation Scenario Dialog Box



The top section of the dialog box contains a filter that allows you to search through the scenarios list and the **Settings** button allows you to configure the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

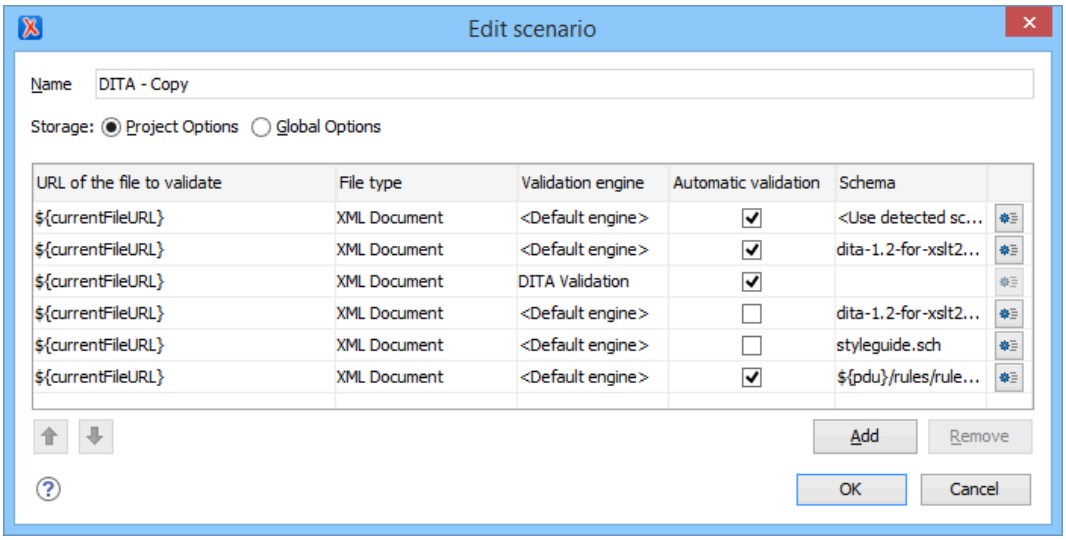
> **Note:**
> When you keep both scenarios, Oxygen XML Editor adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor creates a `scenarios` file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

2. Select the scenario and click the **Edit** button. If you try to edit one of the *read-only* built-in scenarios, you will receive a warning message that Oxygen XML Editor needs to creates customizable duplicate (you can also use the **Duplicate** button).
   The **Edit scenario** dialog box is displayed and it lists all the validation units for the scenario.

Figure 230. Edit Validation Scenario



This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

Storage

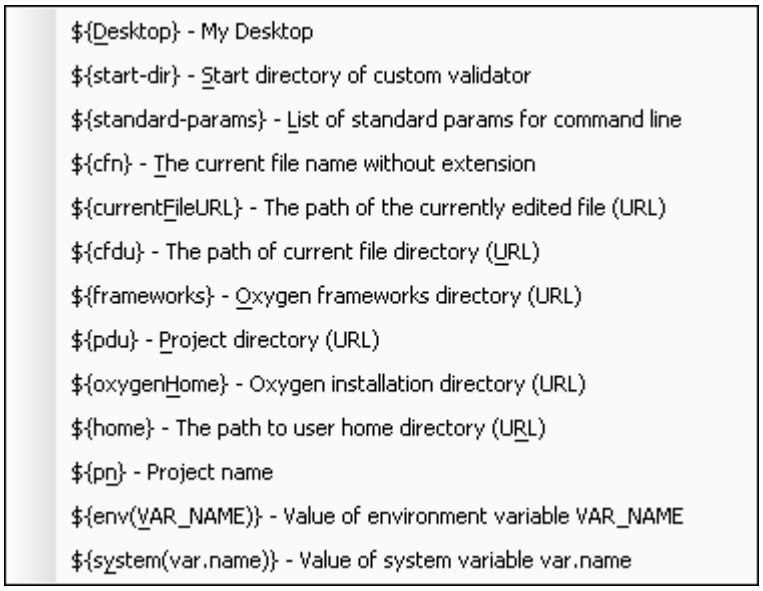
You can choose between storing the scenario in the **Project Options** *(on page 3423)* or **Global Options** *(on page 3420)*.

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an editor variable *(on page 332)* or a custom editor variable *(on page 342)*.

Figure 231. Insert an Editor Variable



File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can select one of the engines available in Oxygen XML Editor for validation of the particular document type:

- **Default engine** - The default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page *(on page 254)*, XQuery preferences page *(on page 262)*, XML Schema preferences page *(on page 247)*).
- **DITA Validation** engine - Performs DITA-specific checks in the context of the specifications (it is similar to the process when using the **Validate and Check for Completeness** action *(on page 3118)* in the **DITA Maps Manager**, but for a local file rather than an entire *DITA map (on page 3419)*).
- **DITA Map Validation and Completeness Check** engine - Performs a validation process that checks the DITA map document and all referenced topics and maps (it is similar to the process when using the **Validate and Check for Completeness** action *(on page 3118)* in the **DITA Maps Manager**).

- **DITA-OT Project Validation and Completeness Check** engine - Performs a validation process that checks each context from the provided DITA-OT project file (it is similar to the process when using the **Validate and Check for Completeness** action *(on page 3118)* in the **DITA Maps Manager**).
- **Table Layout Validation** engine - Looks for table layout problems (for more information, see the Report table layout problems option *(on page 3123)*).

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature *(on page 786)*. If the **Automatic validation** feature is disabled in the Document Checking preferences page *(on page 235)*, then this option is ignored, as the preference setting has a higher priority.

Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

Settings

Depending on the selected validation engine, clicking the **Settings** button either opens the **Specify Schema** dialog box or the **Configure validation engine** dialog box.

- **Specify Schema Dialog Box**

  This dialog box allows you to specify a custom schema to be used for the validation process.

  Figure 232. Specify Schema Dialog Box

  
  The **Specify Schema** dialog box contains the following options:

  Use detected schema

  Uses the schema detected for the particular document *(on page 828)*.

  Use custom schema

Allows you to specify the schema using the following options:

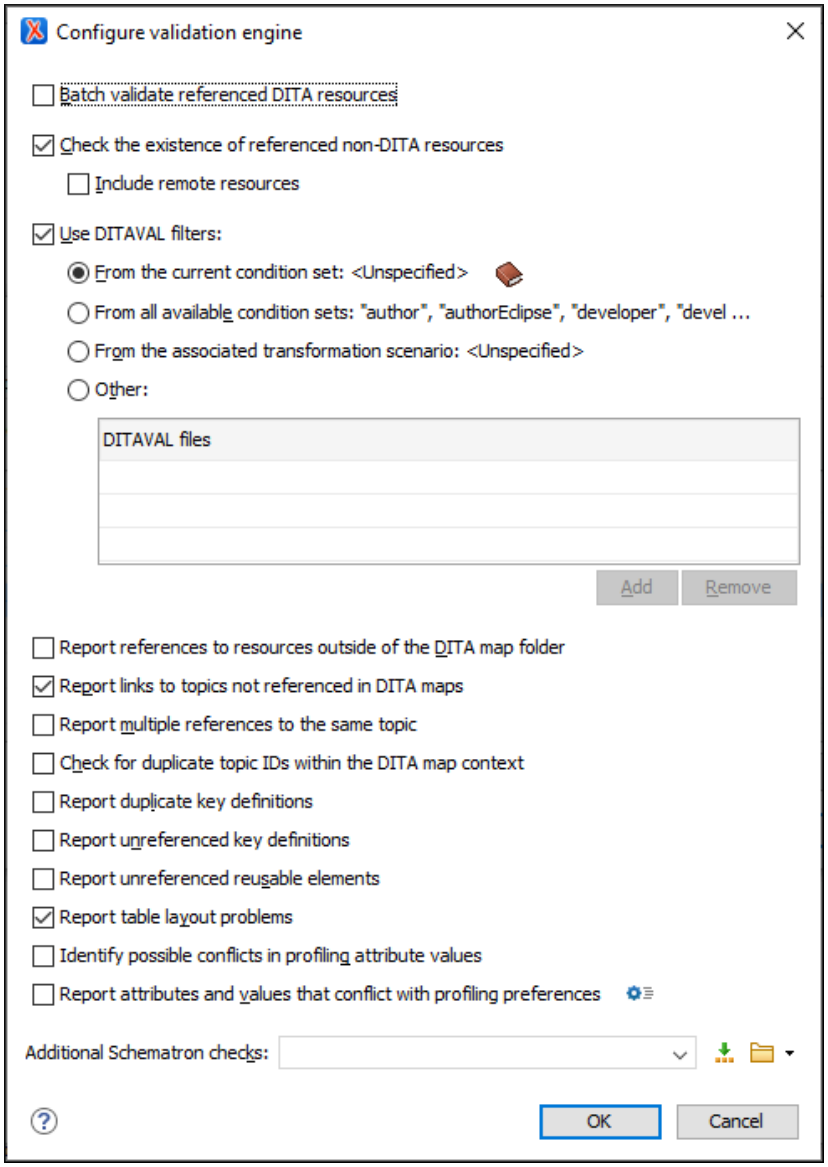
- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(on page 2563)*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (on page 3420)* to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

◦ **Configure Validation Engine Dialog Box**

This dialog box allows you to configure options for checking the DITA map document and all referenced topics and maps (similar to the process done when using the **Validate and Check for Completeness** action *(on page 3118)* in the **DITA Maps Manager**).

> **Note:**
> The options presented in the **Configure validation engine** dialog box depends on type of validation engine. For example, when configuring the **DITA-OT Project Validation and Completeness Check** validation engine, the dialog box has slightly fewer options (omitting those that are not applicable).

Figure 233. Example of the Configure Validation Engine Dialog Box



The **Configure Validation Engine** dialog box contains the following options:

Batch validate referenced DITA resources

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario *(on page 798)*.

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the **DITA Maps Manager** view *(on page 3073)*. Clicking the **Details** icon opens a topic in the Oxygen XML Editor User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the *DITA map*.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the **Add** or **Remove** buttons to configure the list. The **Add** button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the *main DITA map (on page 3424)* folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the *DITA map*. Also reports related links defined in relationship tables whose target topics are not referenced in the DITA Map.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the *DITA map*, unless a unique `@copy-to` attribute is used on the `<topicref>` element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second `<topicref>` has a `@copy-to` attribute set:

```
<topicref href="topic.dita"/>
.....
 <topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a `@copy-to` attribute set or both of them have the `@copy-to` attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita"/>
......
 <topicref href="topic.dita" copy-to="topic2.dita"/>
```

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the *DITA map* for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `@keys` attribute, all references will point to the first one encountered and the other will be ignored.

Note:
This option takes *key scopes (on page 3239)* into account. For example, if you have something like this:

```
<topicref href="t2.dita" keys="k2"/>
    <topicgroup keyscope="ks">
        <topicref href="t2.dita" keys="k2"/>
    </topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a *key scope (on page 3239)* on the second occurrence.

Report unreferenced key definitions

Checks the entire *DITA map* and reports any key definitions that are not referenced anywhere. Note that if the **Use DITAVAL filters** option is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire *DITA map* and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an *ID* specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to **resource-only**.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a *CALS* table, if a cell has a vertical span greater than the available rows count.
- For a *CALS* table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a *CALS* table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a *CALS* table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a *CALS* table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the **Profiling / Conditional Text** preferences page *(on page 195)* (you can click the **Profiling Preferences** button to open this preferences page). It also checks if profiling attributes defined as *single-value* have multiple values set in the searched topics.

Additional Schematron checks

Allows you to select a Schematron file that Oxygen XML Editor will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.

Advanced Tip:
Some APIs are available that retrieve information about DITA keys that are referenced within a topic. The APIs can be called from XSLT Stylesheets (including XML Refactoring operations) or Schematron schemas. For details, see API Documentation: DITAXSLTExtensionFunctionUtil.

Move Up

Moves the selected validation unit up one spot in the list.

Move Down

Moves the selected validation unit down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the **validation phase**.
4. When you are done configuring the scenario, click **OK**.
   The modified validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. If you chose to duplicate an existing one, the modified scenario will be listed with the word *copy* at the end of its name.

Sharing Validation Scenarios

The validation scenarios and their settings can be shared with other users by saving them at project level *(on page 3423)* or by exporting them to a specialized scenarios file *(on page 332)* that can then be imported. When you create a new validation scenario or edit an existing one, there is a **Storage** option to control whether the scenarios are stored in **Project Options** *(on page 3423)* or **Global Options** *(on page 3420)*.

Selecting **Project Options** *(on page 3423)* stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Selecting **Global Options** *(on page 3420)* stores the scenario in the global options that are stored in the user home directory.

You can also change the storage options on existing validation scenarios by using the **Change storage** action from the contextual menu of the list of scenarios.

Related Information:
Sharing Application Settings *(on page 321)*

Resolving References to Remote Schemas with an XML Catalog

When a reference to a remote schema must be used in the validated XML document for interoperability purposes, but a local copy of the schema should actually be used for performance reasons, the reference can be resolved to the local copy of the schema with an *XML Catalog (on page 3425)*.

For example, if the XML document contains a reference to a remote schema `docbook.rng` like this:

```
<?xml-model href="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
    type="application/xml" schematypens="http://relaxng.org/ns/structure/1.0"?>
```

it can be resolved to a local copy with a catalog entry like this:

```
<uri name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
    uri="rng/docbook.rng"/>
```

An *XML Catalog* can also be used to map an XML Schema specified with a URN in the `@xsi:schemaLocation` attribute of an XML document to a local copy of the schema. For example, if the XML document specifies the schema with:

```
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1">
```

the URN can be resolved to a local schema file with a catalog entry like this:

```
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
    uri="topic.xsd"/>
```

Related Information:
Working with XML Catalogs *(on page 838)*

Validation Example - A DocBook Validation Error

In the following DocBook 4 document, the content of the `<listitem>` element does not match the rules of the DocBook 4 schema (`docbookx.dtd`).

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.4//EN"
     "http://www.docbook.org/xml/4.4/docbookx.dtd">
<article>
    <title>Article Title</title>
    <sect1>
```

```
      <title>Section1 Title</title>
      <itemizedlist>
        <listitem>
          <link>a link here</link>
        </listitem>
      </itemizedlist>
    </sect1>
</article>
```

The  **Validate Document** action will return the following error:

```
Unexpected element "link". The content of the parent element type must match
"(calloutlist|glosslist|bibliolist|itemizedlist|orderedlist|segmentedlist|simplelist
|variablelist|caution|important|note|tip|warning|literallayout|programlisting
|programlistingco|screen|screenco|screenshot|synopsis|cmdsynopsis|funcsynopsis
|classsynopsis|fieldsynopsis|constructorsynopsis|destructorsynopsis|methodsynopsis
|formalpara|para|simpara|address|blockquote|graphic|graphicco|mediaobject|mediaobjectco
|informalequation|informalexample|informalfigure|informaltable|equation|example|figure
|table|msgset|procedure|sidebar|qandaset|task|anchor|bridgehead|remark|highlights
|abstract|authorblurb|epigraph|indexterm|beginpage)+".
```

This error message is a little more difficult to understand, so understanding of the syntax or processing rules for the DocBook XML DTD `<listitem>` element is recommended. However, the error message does offer a clue as to the source of the problem, indicating that *"The content of element type must match"*.

Fortunately, most standards-based DTDs, XML Schemas, and Relax NG schemas are supplied with reference documentation. This enables you to read about the element. In this case, you should learn about the child elements of `<listitem>` and their nesting rules. Once you have correctly inserted the required child element and nested it in accordance with the XML rules, the document will become valid.

Embedding Schematron Rules in XML Schema or RELAX NG

Schematron rules can be embedded into an XML Schema through annotations (using the `<appinfo>` element), or in any element on any level of a RELAX NG Schema (taking into account that the RELAX NG validator ignores all elements that are not in the RELAX NG namespace).

Oxygen XML Editor supports Schematron validation schemas and it is able to extract and use the embedded rules.

Validating XML Documents with XML Schema and Embedded Schematron

To validate an XML document with XML Schema and its embedded Schematron, you can associate the document like this:

```
<?xml-model href="percent.xsd" type="application/xml"
            schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

Validating XML Documents with Relax NG and Embedded Schematron

To validate an XML document with RELAX NG schema and its embedded Schematron rules, you need to associate the document with both schemas like this:

```
<?xml-model href="percent.rng" type="application/xml"
            schematypens="http://relaxng.org/ns/structure/1.0"?>
<?xml-model href="percent.rng" type="application/xml"
            schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

The second association validates your document with Schematron rules extracted from the RELAX NG Schema.

Note:
When you work with XML Schema or Relax NG documents that have embedded Schematron rules Oxygen XML Editor provides two built-in validation scenarios: **Validate XML Schema with embedded Schematron** for XML schema, and **Validate Relax NG with embedded Schematron** for Relax NG. You can use one of these scenarios to validate the embedded Schematron rules.

Example: Embedded Schematron in XML Schema

```
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
  </sch:pattern>
</xsd:appinfo>
```

Example: Embedded Schematron in Relax NG Schema

```
<grammar
    xmlns="http://relaxng.org/ns/structure/1.0"
    xmlns:sch="http://purl.oclc.org/dsdl/schematron" >
    <sch:pattern>
      <sch:rule context="...">
        <sch:assert test="...">Message.</sch:assert>
      </sch:rule>
    </sch:pattern>
    <start>
     ..............
```

```
    </start>
</grammar>
```

Embedding Schematron Quick Fixes in Relax NG or XML Schema *(on page 1284)*

Ignoring/Unignoring Validation Problems

If the **Enable support for ignoring validation problems** option *(on page 238)* is selected in the **Ignored Validation Problems** preferences page *(on page 238)*, validation problems can be ignored using quick fix actions that are automatically added to the list of proposals for fixing the problem. These quick fix actions are available for validation problems that have an ID in the following places in the interface:

- When the cursor is placed at the location of the problem in the main editor pane, a *Quick Fix* icon () is displayed in the stripe on the left side of the editor. Clicking that icon opens a pop-up window where the quick fix proposals are presented.
- When you hover over the problem in the editor, the proposals are presented in a tooltip.
- When you right-click a problem in the **Results** view *(on page 558)*, the proposals are available in the contextual menu.

Note:
For Schematron-based validation, these quick fix actions for ignoring problems are available for validation problems that have an ID set on the Schematron `<assert>` or `<report>` elements. That ID, prefixed with the name of the Schematron, is used as the error code (e.g. `flowers.sch:xrefFormatID`).

The quick fix actions for ignoring problems are:

Ignore this problem in this document

When validating this document, this problem will be ignored based on the message, error code, and file location.

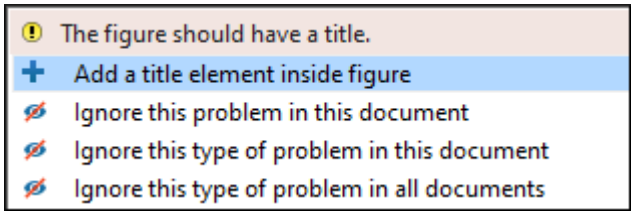
Ignore this type of problem in this document

When validating this document, this type of problem will be ignored based on the error code and file location.

Ignore this type of problem in all documents

When validating any document, this type of problem will be ignored based on the error code.

Figure 234. Schematron Ignored Problems Quick Fix Proposals



When a validation problem is ignored:

- It is added to the *Ignored Problems Table (on page 238)* in the **Ignored Validation Problems** preferences page *(on page 238)*. The table displays all the problems that you have specified to be ignored and you can remove items from the table by selecting them and clicking the **Delete** button located under the table.
- It will no longer be highlighted in the editor pane.
- In the vertical range ruler on the right side of the editor, the problem will be marked with a gray color.
- In the **Results** view *(on page 558)*, the problem will be marked with a disabled (grayed out) action.
- The ignored problem will also be marked when a batch validation operation is executed.

How to Unignore Validation Problems

Validation problems that have previously been ignored (hence, they are added to the *Ignored Problems Table (on page 238)*) can be unignored (removed from the table) using the **Remove from ignored problems list** action from the problem's contextual menu in the **Results** view *(on page 558)*.

Another way to unignore a problem that has been ignored is to hover over its gray marker in the vertical ruler on the right side of the editor until a tooltip is displayed, then use **F2** to change the focus to the tooltip, then click the **Remove from ignored problems list** quick fix link. This results in that problem being removed from the list and the problem is no longer ignored.

XML Quick Fixes

The Oxygen XML Editor *Quick Fix* support *(on page 3423)* helps you resolve errors that appear in an XML document by offering *Quick Fixes* to problems such as missing required attributes or invalid elements. *Quick Fixes* are available in **Text** mode and **Author** mode

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a *Quick Fix* is available for that particular error or warning, you can access the *Quick Fix* proposals with any of the following methods:

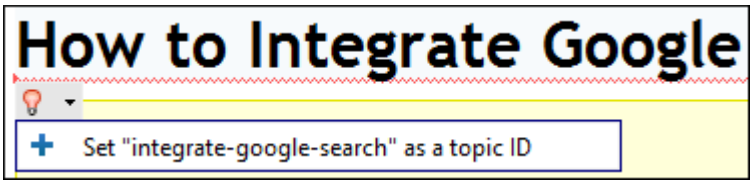
- When hovering over the error or warning, the proposals may be presented in a tooltip pop-up window and the available quick *Quick Fixes* include a link that can be used to perform the fix.

Figure 235. Quick Fix Presented in a Tooltip in Text Mode

Figure 236. Quick Fix Presented in a Tooltip in Author Mode

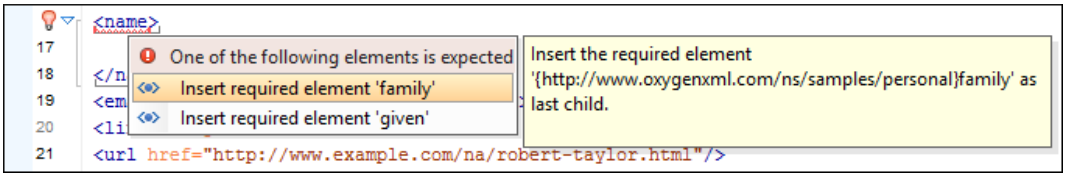
- When hovering over the error or warning in **Author** mode, a small *Quick Fix* drop-down menu is presented. You can use the drop-down menu to display a list of available *Quick Fixes* to select from for the particular error or warning.

Figure 237. Quick Fix Drop-Down Menu in Author Mode



- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon ( ) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor displays the list of available fixes.

Figure 238. Quick Fix Menu Invoked by Clicking on the Icon



- With the cursor placed in the highlighted area of the error or warning, you can also invoke the *Quick Fix* menu by pressing **Alt + 1 (Command + Option + 1 on macOS)** on your keyboard.

Whenever you make a modification in the XML document or you apply a fix, the list of *Quick Fixes* is recomputed to ensure that you always have valid proposals.

Note:
A *Quick Fix* that adds an element inserts it along with required and optional elements, and required and fixed attributes, depending on how the **Content Completion** preferences *(on page 219)* are configured.

Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor offers *Quick Fixes (on page 3423)* for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

Note:
For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

Quick Fixes are available in **Text** mode and **Author** mode.

Oxygen XML Editor provides *Quick Fixes* for numerous types of problems, including the following:

Problem Type	Available Quick Fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

Related Information:
Schematron Quick Fixes (SQF) *(on page 827)*
Ignoring/Unignoring Validation Problems *(on page 823)*

Schematron Quick Fixes (SQF)

Oxygen XML Editor provides support for Schematron *Quick Fixes (on page 3423)* (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron *Quick Fixes* are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with *assert* or *report* messages.

A typical use case is using Schematron *Quick Fixes* to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, see the following blog post: https://blog.oxygenxml.com/topics/SchematronBCs.html.

Displaying the Schematron Quick Fix Proposals

The defined Schematron *Quick Fixes* are displayed on validation errors in **Text** mode and **Author** mode.

Figure 239. Example of a Schematron Quick Fix

Presenting Schematron Validation Issues *(on page 1241)*
Examples of Schematron Rules and Quick Fixes *(on page 1229)*
Ignoring/Unignoring Validation Problems *(on page 823)*

Associating a Schema to XML Documents

To provide as-you-type validation and to compute valid proposals for the *Content Completion Assistant (on page 3418)*, Oxygen XML Editor requires a schema to be associated with the XML document. The schema specifies how the internal structure of the XML is defined.

Supported Types of Schema

The following schema types are supported:

- **W3C XML Schema 1.0 and 1.1** (with and without embedded Schematron rules) - The association with an XML Schema is added as an attribute of the root element with one of the following:
  - `@xsi:schemaLocation` attribute, if the root element of the document is in the namespace.
  - `@xsi:noNamespaceSchemaLocation` attribute, if the root element is not in the namespace.
- **DTD** - The association with a DTD is added as a `DOCTYPE` declaration.
- **Relax NG - XML Syntax** (with and without embedded Schematron rules) - The association is added as an *xml-model* processing instruction.
- **Relax NG - Compact Syntax** - The association is added as an *xml-model* processing instruction.
- **NVDL** - The association is added as an *xml-model* processing instruction.
- **Schematron** (both ISO Schematron and Schematron 1.5) - The association is added as an *xml-model* processing instruction.

Detecting the Schema(s) for Validation

For validation, Oxygen XML Editor tries to detect one or more schemas by searching multiple locations, in the following order:

1. The schema or multiple schemas referenced in validation stages from the validation scenario(s) *(on page 829)* associated with the current XML document.
2. If no validation scenario is selected to be used with the current XML document, then it falls back to the schema or multiple schemas defined in validation stages from the validation scenarios specified as default in the particular document type configuration *(on page 833)*.
3. If a schema is still not detected, then it falls back to the schema or multiple schemas associated directly in the XML document *(on page 835)*.

   Tip:
   To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

4. If a schema is still not detected, then it falls back to the schema defined in the **Schema** tab of a *framework* (document type) configuration *(on page 837)*.

Detecting a Schema for Content Completion

For content completion, Oxygen XML Editor uses just one schema and tries to detect that schema by searching multiple locations, in the following order:

1. If no schema is detected in the document, then it falls back to the highest ranking schema defined in validation stages from the validation scenario(s) associated with the current document *(on page 829)*.
2. If a schema is still not detecting, then it falls back to the highest ranking schema defined in validation stages from validation scenarios specified as default in the particular document type configuration *(on page 833)*.

3. Oxygen XML Editor determines the most appropriate or highest ranking schema that is associated directly in the XML document *(on page 835)* and uses it for content completion.
4. If a schema is still not detecting, then it falls back to the schema defined in the **Schema** tab of a *framework* (document type) configuration *(on page 837)*.

Related Information:
Modular Contextual XML Editing Using 'Main Files' Support *(on page 841)*
W3C: Associating Schemas with XML Documents

Associating a Schema Through a Validation Scenario

Oxygen XML Editor uses the rules defined in the detected schema to report errors and warnings during automatic and manual validations that help maintain the structural integrity of your XML documents. You can specify the schema to be used for validation directly in validation scenarios *(on page 798)* and there are several methods that can be used to do so.

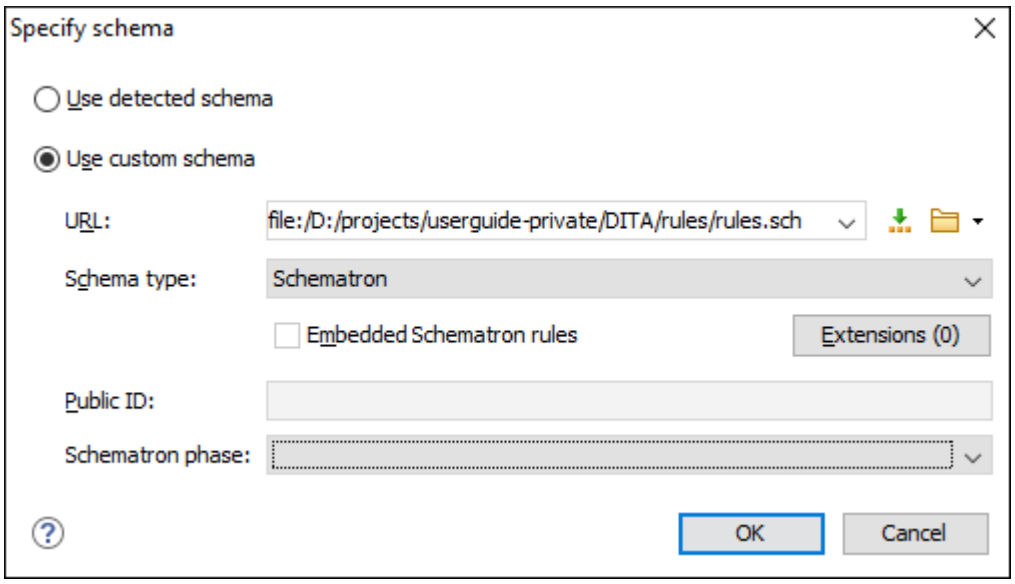
Configure a Validation Scenario and Specify the Schema

To associate a schema to a validation scenario to be used whenever the scenario is invoked, follow these steps:

1. Select the **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project** view *(on page 413)*).
2. Click the **New** button to create a new validation scenario or the **Edit** button to modify an existing one.
3. Add or configure validation units *(on page 811)* according to your needs and click the **Specify Schema** button.

   Step Result: The **Specify Schema** dialog box is displayed:

Figure 240. Specify Schema Dialog Box



The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the schema detected for the particular document *(on page 828)*.

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(on page 2563)*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (on page 3420)* to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

4. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.
5. Click **OK** on both dialog boxes.

Result: The schema is now associated with that validation scenario whenever it is invoked.

Use the Validate with Action to Specify a Schema for Validating the Current Document

To validate the current document using a specified schema, follow these steps:

1. Select the **Validation with** action from the **Validation** drop-down menu on the toolbar (or **Document > Validate** menu).

   Step Result: The **Validate with** dialog box is displayed:

   Figure 241. Validate with Dialog Box

   This dialog box contains the following options:
   - **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(on page 2563)*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.
   - **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
   - **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
   - **Public ID** - Allows you to specify a public ID if you have selected a DTD.
   - **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (on page 3420)* to be used during the validation.
   - **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

2. Select the schema to be associated with the manual validation and configure the rest of the options according to your preferences.
3. Click **OK**.

Result: The current document is validated using the schema you specified.

> **Tip:**
> To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

Use the Validate with Schema Action to Specify a Schema for Validating all Selected Documents

To validate multiple documents using a specified schema, follow these steps:

1. Select all the documents you want to validate in the **Project** view .
2. Invoke the contextual menu (right-click) and select the **Validate with Schema** action from the **Validate** submenu.

   Step Result: The **Validate with** dialog box is displayed:

   Figure 242. Validate with Dialog Box

   This dialog box contains the following options:
   - **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(on page 2563)*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.
   - **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
   - **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
   - **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (on page 3420)* to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

3. Select the schema that you want to use to validate all selected documents and configure the rest of the options according to your preferences.
4. Click **OK**.

Result: The selected documents are validated using the schema you specified.

Associating a Schema in Validation Scenarios Defined in the Document Type

To report errors and warnings during automatic and manual validations that help maintain the structural integrity of particular XML document types, Oxygen XML Editor uses rules defined in the schema that is detected in the validation scenarios that are associated to each particular document type.

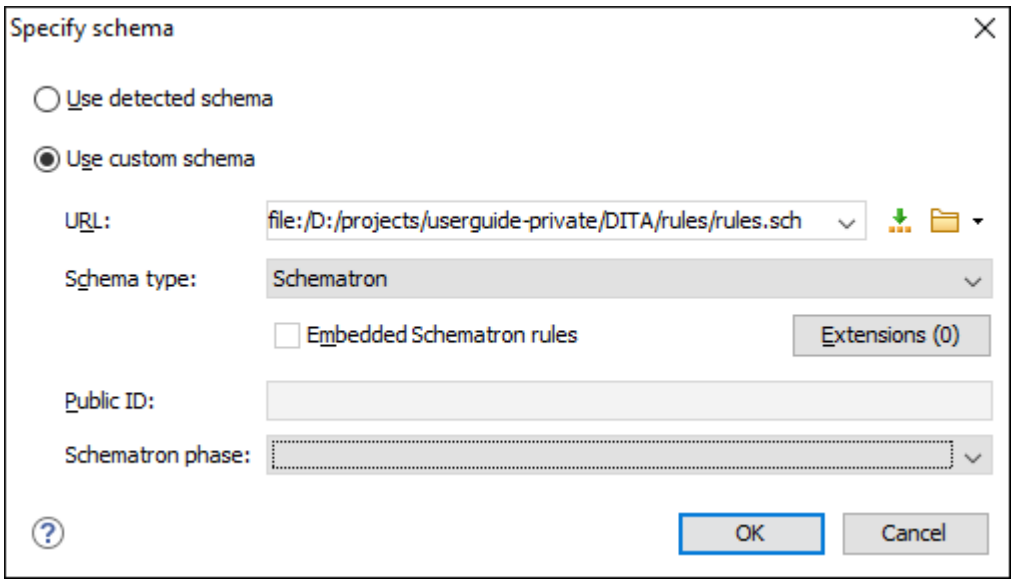
To associate a schema in validation scenarios defined in the *framework (on page 3420)* (document type) configuration, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Document Type Association**.
2. Select your particular document type and click the **Edit** or **Duplicate** button to modify an existing *framework* (or use the **New** button to create a new one).

   Step Result: This opens a **Document type** configuration dialog box *(on page 147)*.
3. Go to the **Validation** tab *(on page 173)*.
4. Create or edit a validation scenario:
   a. To create a new validation scenario *(on page 799)*, click the **New** button.
   b. To edit the properties of an existing validation scenario *(on page 809)*, select it and click the **Edit** button (you can also use the **Duplicate** button to copy an existing scenario and edit its properties).
5. Add or configure validation units *(on page 811)* according to your needs and click the **Specify Schema** button.

   Step Result: The **Specify Schema** dialog box is displayed:

Figure 243. Specify Schema Dialog Box



The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the schema detected for the particular document *(on page 828)*.

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(on page 2563)*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(on page 332)* button, or the browsing actions in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (on page 3420)* to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

6. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.
7. Click **OK** on both dialog boxes.

Result: The schema is now associated with the validation scenario you just configured for that particular document type.

Associating a Schema Directly in XML Documents

The schema used by the *Content Completion Assistant (on page 3418)* and document validation engine can be directly associated with the current document by using the **Associate Schema** action. For most of the schema types, it uses the *xml-model* processing instruction, with the exceptions of:

- **W3C XML Schema** - The `@xsi:schemaLocation` attribute or `@xsi:noNamespaceSchemaLocation` attribute is used.
- **DTD** - The `DOCTYPE` declaration is used.

The association can specify a relative file path or a URL of the schema. The advantage of relative file path is that you can configure the schema at file level instead of *framework (on page 3420)* level.

To associate a schema to the current document, follow these steps:

1. Select the **Associate Schema** action from the toolbar (or **Document > Schema** menu).

   Step Result: The **Associate Schema** dialog box is displayed:

   Figure 244. Associate Schema Dialog Box

   
   This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(on page 2563)*.
- **Use path relative to file location** - Select this option if the XML instance document and the associated schema contain relative paths. The location of the schema file is inserted in the XML instance document as a relative file path. This practice allows you, for example, to share these documents with other users without running into problems caused by multiple project locations on physical disk.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Add additional association for embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Keep existing schema associations** - Select this option to use the existing schema associations of the currently edited document.

2. Select the schema that will be associated with the XML document and configure the rest of the options according to your preferences.
3. Click **OK**.

Result: The schema association is created based upon the specified type.

- **XML Schema** - The association with an XML Schema is added as an attribute of the root element with one of the following:
  - `@xsi:schemaLocation` attribute, if the root element of the document is in the namespace.
  - `@xsi:noNamespaceSchemaLocation` attribute, if the root element is not in the namespace.
- **DTD** - The association with a DTD is added as a `DOCTYPE` declaration.
- **Other** - The association with a Relax NG, Schematron, or NVDL schema is added as an *xml-model* processing instruction.

Tip:
To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

Content Completion Assistant in Author Mode *(on page 626)*

Associating a Schema in a Framework (Document Type) Configuration

The schema used to compute valid proposals in the *Content Completion Assistant (on page 3418)* and by the document validation engine to report errors and warnings can be defined in each particular *framework (on page 3420)* (document type). This schema will be used only if one is not detected in the current XML file *(on page 835)*.

To associate a schema in a particular *framework* (document type), follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Document Type Association**.
2. Select your particular document type and click the **Edit** *(on page 146)*, **Extend** *(on page 146)*, or **Duplicate** *(on page 146)* button to modify an existing *framework* (or use the **New** button to create a new one).

   Step Result: This opens a **Document type** configuration dialog box *(on page 147)*.
3. Go to the **Schema** tab *(on page 151)*.
4. Select the schema type and its URI.
5. Click **OK**.

Result: The schema is now associated with the particular document type and will be used by the *Content Completion Assistant* and validation engine if a schema is not detected in the current XML document.

Learn Document Structure When Schema is not Detected

When working with documents that do not specify a schema, or the schema is not known or does not exist, Oxygen XML Editor can learn the document structure by parsing the document internally to provide an initialization source for content completion *(on page 542)* and document validation *(on page 784)*.

This feature is controlled by the **Learn on open document** option *(on page 219)* that is available in the **Editor > Content Completion** preferences page. This feature enabled by default. If you want to disable it, deselect the **Learn on open document** option.

You can choose to create a DTD from the learned structure and save it as a file using the **Learn Structure** and **Save Structure** actions.

Creating a DTD from Learned Document Structure

To create a DTD from the learned structure of an XML document, follow these steps:

1. Open the XML document that will be used to create the DTD.
2. Go to **Document > XML Document > Learn Structure** (**Ctrl + Shift + L (Command + Shift + L on macOS)**). The **Learn Structure** action reads the mark-up structure of the current document. A **Learn completed** message is displayed in the application status bar when the action is finished.

3. Go to **Document > XML Document > Save Structure** (**Ctrl + Shift + S (Command + Shift + S on macOS)**) and enter the file path for the DTD.
4. Click the **Save** button.

Related Information:
Detecting a Schema *(on page 827)*

Working with XML Catalogs

Oxygen XML Editor uses *XML Catalogs (on page 3425)* to resolve references for validations and transformations and they are especially helpful for resolving external resources when internet access is not available or your connection is slow.

Oxygen XML Editor supports any *XML Catalog* file that conforms to one of the following:

1. OASIS XML Catalogs Committee Specification v1.1.
2. OASIS Technical Resolution 9401:1997, including the plain-text flavor described in that resolution.

The version 1.1 of the OASIS *XML Catalog* specification introduces the possibility to map a system ID, public ID, or a URI to a local copy using only a suffix of the ID or URI used in the actual document. This is done using the catalog elements *systemSuffix* and *uriSuffix*.

Depending on the resource type, Oxygen XML Editor uses different catalog mappings.

Table 9. Catalog Mappings

Doc Type	Referenced Resource	Mappings
XML	DTD	*system* or *public* The **Prefer** option *(on page 244)* controls which one of the mappings should be used.
	XML Schema Relax NG Schematron NVDL	The following strategy is used (if one step fails to provide a resource, the next is applied): 1. Resolve the schema using *URI* catalog mappings. 2. Resolve the schema using *system* catalog mappings. This happens only if the **Resolve schema locations also through system mappings** option *(on page 244)* is selected (it is by default). 3. Resolve the root *namespace* using *URI* catalog mappings.
XSL	XSL/ANY	*URI*
CSS	CSS	*URI*

Table 9. Catalog Mappings (continued)

Doc Type	Referenced Resource	Mappings
JSON	JSON	*URI*
XPROC	XPROC	*URI*
XML Schema	XML Schema	The following strategy is used (if one step fails to provide a resource, the next is applied): 1. Resolve schema reference using *URI* catalog mappings. 2. Resolve schema reference using *system* catalog mappings. This happens only if the **Resolve schema locations also through system mappings** option *(on page 244)* is selected (it is by default). 3. Resolve schema *namespace* using *URI* catalog mappings. This happens only if the **Process namespaces through URI mappings for XML Schema** option *(on page 244)* is selected (it is not by default).
Relax NG	Relax NG	

Creating an XML Catalog with a Template

An *XML Catalog (on page 3425)* file can be easily created in Oxygen XML Editor starting from the document template called *OASIS XML Catalog*. It is available when creating new document templates *(on page 377)*.

How Oxygen XML Editor Determines which Catalog to Use

Oxygen XML Editor uses *XML Catalogs (on page 3425)* to resolve references for validations and transformations and it maps such references to the built-in local copies of the schemas associated with the various *frameworks (on page 3420)* (DocBook, DITA, TEI, XHTML, SVG, etc.)

Oxygen XML Editor includes default global catalogs and default catalogs for each of the built-in *frameworks*, and you can also create your own.

Oxygen XML Editor looks for catalogs in the following order:

- Global user-defined catalogs that are set in the **XML Catalog** preferences page *(on page 243)*.
- User-defined catalogs that are set for each *framework (on page 3420)* in the **Catalog** tab *(on page 171)* of the **Document Type** configuration dialog box *(on page 147)*.
- Default built-in catalogs.

Example: Using an XML Catalog to map an Absolute XML Schema Reference to an XML Schema Located Relative to the XML Catalog

An *XML Catalog* can be used to map an XML Schema specified with a URN in the `@xsi:noNamespaceSchemaLocation` attribute of an XML document to a local copy of the schema.

Considering the following XML document code snippet:

```
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1">
```

The URN can be resolved to a local schema file with an XML catalog entry like this:

```
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
    uri="topic.xsd"/>
```

Example: Using an XML Catalog to map an Imported XML Schema Reference to an XML Schema Located Relative to the XML Catalog

An *XML Catalog* can be used to map an `xs:import` or `xs:include` XML Schema reference to a local copy of the schema.

Considering the following `xs:include` inside an XML Schema:

```
<xs:include schemaLocation="someFolder/common.xsd"/>
```

The reference can be resolved to a local schema file with an XML catalog entry like this:

```
<uriSuffix uriSuffix="someFolder/common.xsd" uri="relative/path/to/common.xsd"/>
```

Related information

XML Catalog Preferences *(on page 243)*

Resolving Schema Locations Through XML Catalogs

Schema locations can be mapped using an *XML Catalog (on page 3425)*. Oxygen XML Editor resolves the location of a schema in the following order:

- First, it attempts to resolve the schema location as a URI (`uri`, `uriSuffix`, `rewriteUri`, `delegateUri` mappings from the *XML Catalog*). If this succeeds, the process end here.
- If the **Resolve schema locations also through system mappings** option *(on page 244)* is selected in the **XML Catalog** preferences page, it attempts to resolve the schema location as a system ID (`system`, `systemSuffix`, `rewriteSuffix`, `rerwriteSystem` from the *XML Catalog*). If this succeeds, the process ends here.
- If the **Process "schemaLocation" namespaces through URI mappings for XML Schema** option *(on page 244)* is selected in the **XML Catalog** preferences page, the target namespace of the imported XML Schema is resolved through URI mappings. If the schema specified in the *schemaLocation* attribute is not resolved successfully, the namespace of the root element is taken into account. If this succeeds, the process ends here.
- If none of these succeeds, the actual schema location *(on page 828)* is used.

Modular Contextual XML Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex XML modular structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Editor provides the support for defining the main module (or modules), allowing you to edit any file from the hierarchy in the context of the *main files (on page 3421)*.

You cat set a main XML document either using the *main files* support from the **Project** view *(on page 428)*, or using a validation scenario.

To set a *main file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main XML document. In this case, it considers the current module as the main XML document.

The advantages of working with modular XML files in the context of a *main file (on page 3421)* include:

- Correct validation of a module in the context of a larger XML structure.
- *Content Completion Assistant (on page 3418)* displays all collected entities and IDs starting from the *main files*.
- Oxygen XML Editor uses the schema defined in the *main file* when you edit a module that is included in the hierarchy through the *External Entity* mechanism.
- The *main files* defined for the current module determines the scope of the search and refactoring actions *(on page 843)* for ID/IDREFS values and for updating references when renaming/moving a resource. Oxygen XML Editor performs the search and refactoring actions in the context that the *main files* determine, improving the speed of execution.

Contextual Project Operations Using 'Main Files' Support *(on page 428)*

XML Referenced/Dependent Resources View *(on page 844)*

Search and Refactoring Actions for IDs and IDREFS

Oxygen XML Editor allows you to search for ID declarations and references (IDREFS) and to define the scope of the search and refactor operations *(on page 843)*. These operations are available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. These operations are available through the search and refactor actions in the contextual menu. In **Text** mode, these actions are also available in the **Quick Assist** *(on page 575)* menu.

The search and refactor actions from the contextual menu are grouped in the **Manage IDs** section:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation *(on page 843)*. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

> **Note:**
> Available in the **Text** mode only.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** *(on page 843)* dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the **Select the scope for the Search and Refactor operations** *(on page 843)*.

Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** *(on page 843)* dialog box, this scope will be used instead.

> **Note:**
> Available in the **Text** mode only.

Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the **Select the scope for the Search and Refactor operations** *(on page 843)*.

> **Note:**
> Available in the **Text** mode only.

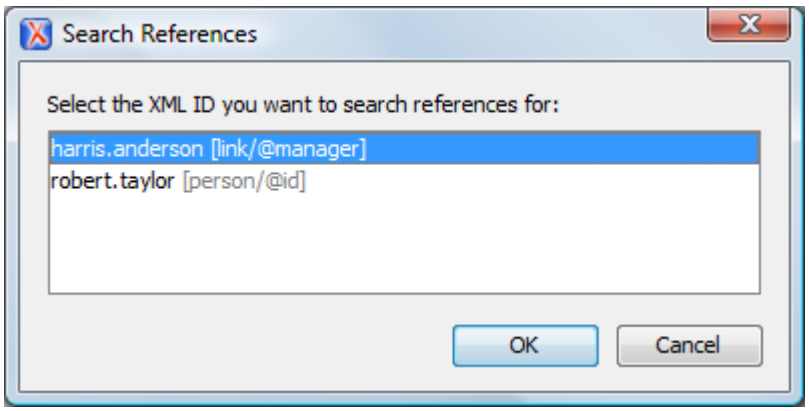
Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

Tip:
A quick way to go to the declaration of an ID in **Text** mode is to move the cursor over an ID reference and use the **Ctrl + Single-Click (Command + Single-Click on macOS)** navigation.

Selecting an ID that you use for search or refactor operations differs between the **Text** and **Author** modes. In the **Text** mode, you position the cursor inside the declaration or reference of an ID. In the **Author** mode, Oxygen XML Editor collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

Figure 245. Selecting an ID in the Author Mode

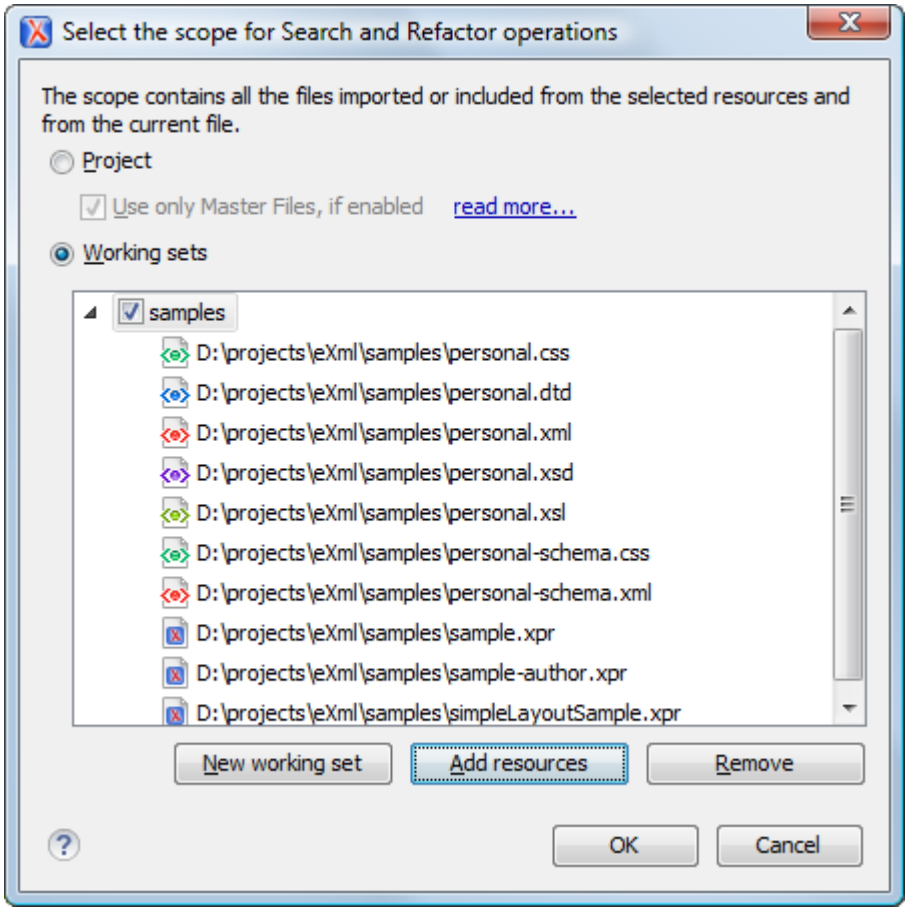


Related Information:
Modular Contextual XML Editing Using 'Main Files' Support *(on page 841)*

Search and Refactor Operations Scope

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the **Change scope** operation, available in the *Quick Assist* action set or on the **Referenced/ Dependent Resources** view's toolbar. You can restrict the scope to the current project or to one or multiple *working sets (on page 3425)*. The **Use only Main Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Main Files** directory. Click **read more** for details about the *Main Files* support *(on page 428)*.

Figure 246. Change Scope Dialog Box



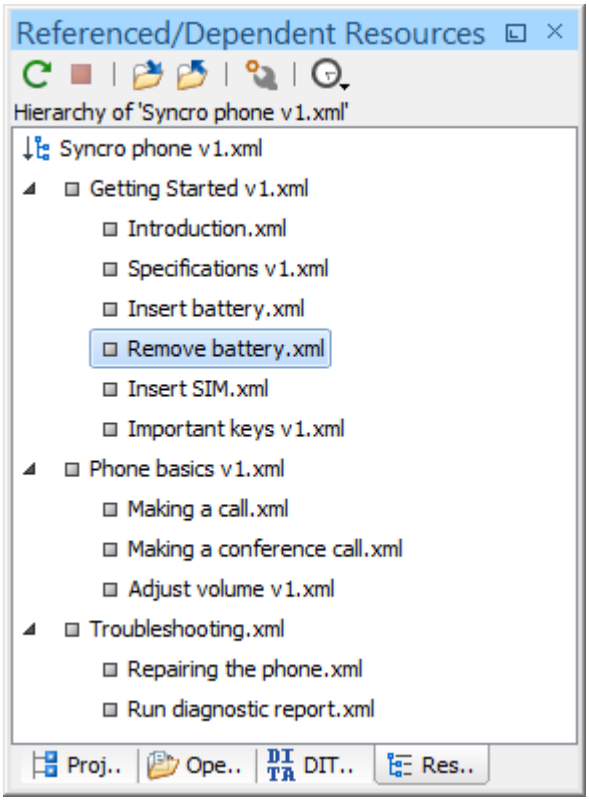
The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the *working set (on page 3425)* structure.

XML Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for resources included in an XML document. The tree structure presented in this view is built based on the *Xinclude* and *External Entity* mechanisms. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If you want to see the hierarchy or dependencies of an XML document, select the document in the **Project** view *(on page 413)* and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

Figure 247. Referenced/Dependent Resources View



The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

Refresh

Refreshes the resource structure.

Stop

Stops the computing.

Show hierarchy for

Computes the hierarchical structure of the references for a resource.

Show dependencies for

Computes the structure of the dependencies for a resource.

Configure dependencies search scope

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

 **Add to Main Files**

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

Tip:
When a recursive reference is encountered in the view, the reference is marked with a special icon .

Note:
The **Move resource** or **Rename resource** actions give you the option to update the references to the resource *(on page 847)*. Only the references made through the *XInclude* and *External Entity* mechanisms are handled.

Related Information:

Modular Contextual XML Editing Using 'Main Files' Support *(on page 841)*
Search and Refactor Operations Scope *(on page 843)*

Moving/Renaming XML Resources

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

Combining XML Content Using DTD Entities and XInclude

When documenting large projects, it is likely that there are multiple people involved. In this case, it is usually more efficient to using a modular approach so that everyone involved in the project can work in parallel. Other advantages of modular documentation include: reusable content possibilities, smaller file units are easier to edit, and better version control.

Two possible solutions for this are to use **DTD Entities** or **XInclude** to combine XML content in a *main file* *(on page 3421)*. A main document can be created with references to various document parts, users can edit those documents individually, and then apply an XSLT stylesheet over the main document to obtain the output files in various formats (for example, PDF or HTML).

Combining XML Document Content Using DTD Entities

There are two conditions for including a document fragment using DTD entities:

- The main document should declare the DTD to be used, while the external entities should declare the XML fragments to be referenced.
- The referenced documents that contain the fragments cannot also define the DTD because the main document will not be valid. If you want to validate the parts separately you have to use XInclude *(on page 849)* for assembling the parts together with the *main file*.

The main document looks like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE book SYSTEM "../xml/docbookx.dtd" [
```

```
<!ENTITY testing SYSTEM "testing.xml" > ]
>
<book>
<chapter> ...
```

The referenced document (*testing.xml*) looks like this:

```
<section> ... here is the section content ... </section>
```

Note:

The indicated DTD and the element names (*section*, *chapter*) are used here only for illustrating the inclusion mechanism. You can use any DTD and element names you need.

The content from the referenced file (in the example above, it is a `<section>` in the *test.xml* file) can be inserted somewhere in the main document:

```
... &testing; ...
```

To obtain output in various formats (for example, PDF or HTML), you simply need to apply an XSLT stylesheet over the main document using a transformation scenario.

Viewing the Expanded Content in Oxygen XML Editor

When a transformation scenario is applied on the *main file*, an intermediary file combines all the referenced content and it will be expanded in the final output. If you want to see how the referenced content will be expanded before applying the transformation, you can do one of the following:

- Simply switch to **Author** mode.
- Create a minimal XSLT stylesheet that simply copies the XML content, then create a new XSLT transformation scenario that applies the stylesheet over the XML. The XSLT stylesheet would look like this:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="3.0">
    <xsl:template match="node() | @*">
        <xsl:copy>
            <xsl:apply-templates select="node() | @*"/>
        </xsl:copy>
    </xsl:template>

</xsl:stylesheet>
```

Combining XML Documents and Fragments Using XInclude

XInclude is a standard for assembling XML instances into another XML document through inclusion. A *main file (on page 3421)* can be dynamically created from smaller XML documents without having to physically duplicate the content of the smaller files. The advantage of using XInclude instead of the DTD Entities method *(on page 847)* is that each of the assembled documents is permitted to contain a Document Type Declaration (DOCTYPE). This means that each file is a valid XML instance and can be independently validated. It also means that the main document, which includes smaller instances, can be validated without having to remove or comment out the DOCTYPE (as is the case with External Entities).

Enabling XInclude Support in Oxygen XML Editor

The XInclude support in Oxygen XML Editor is enabled by default. It is controlled by the **Enable XInclude processing** option *(on page 246)* in the **XML > XML Parser** preferences page *(on page 246)*. When enabled, Oxygen XML Editor will be able to validate and transform documents comprised of parts added using XInclude.

Example: Using XInclude to Combine Files

A chapter file (`introduction.xml`) looks like this:

```
<?xml version="1.0"?>
<!DOCTYPE chapter PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN"
"http://www.oasis-open.org/docbook/xml/4.3/docbookx.dtd">
<chapter>
    <title>Getting started</title>
    <section>
        <title>Section title</title>
        <para>Para text</para>
    </section>
</chapter>
```

The main article (*main file*) looks like this:

```
<?xml version="1.0"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN"
"http://www.docbook.org/xml/4.3/docbookx.dtd"
[ <!ENTITY % xinclude SYSTEM "../frameworks/docbook/dtd/xinclude.mod">
%xinclude;
]>
<article>
    <title>Install guide</title>
    <para>This is the install guide.</para>
    <xi:include xmlns:xi="http://www.w3.org/2001/XInclude"
                href="introduction.xml">
      <xi:fallback>
```

```
        <para>
          <emphasis>FIXME: MISSING XINCLUDE CONTENT</emphasis>
        </para>
      </xi:fallback>
    </xi:include>
</article>
```

In this example, note the following:

- The DOCTYPE declaration defines an entity that references a file containing the information to add the *xi* namespace to certain elements defined by the DocBook DTD.
- The href attribute of the *xi:include* element specifies that the `introduction.xml` file will replace the *xi:include* element when the document is parsed.
- If the `introduction.xml` file cannot be found, the parser will use the value of the *xi:fallback* element - a *FIXME* message.

Example: Using XInclude to Combine Fragments of Files

If you want to include only a fragment of a file in the *main file (on page 3421)*, the fragment must be contained in a tag having an `@xml:id` attribute and you must use an XPointer expression pointing to the `@xml:id` value.

Notice:
Oxygen XML Editor supports the XPointer *Framework* and the XPointer element() Scheme, but it does NOT support the XPointer xpointer() Scheme.

For example, if the *main file* is:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml"
        schematypens="http://relaxng.org/ns/structure/1.0"?>
<test>
    <xi:include href="a.xml" xpointer="a1"
        xmlns:xi="http://www.w3.org/2001/XInclude"/>
</test>
```

and the file (`a.xml`) is:

```
<?xml version="1.0" encoding="UTF-8"?>
<test>
    <a xml:id="a1">test</a>
</test>
```

after resolving the XPointer reference, the document is:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml"
          schematypens="http://relaxng.org/ns/structure/1.0"?>
<test>
    <a xml:id="a1" xml:base="a.xml">test</a>
</test>
```

Viewing the Expanded Content in Oxygen XML Editor

When a transformation scenario is applied on the *main file*, an intermediary file combines all the referenced content and it will be expanded in the final output. If you want to see how the referenced content will be expanded before applying the transformation, you can do one of the following:

- Simply switch to **Author** mode.
- Create a minimal XSLT stylesheet that simply copies the XML content, then create a new XSLT transformation scenario that applies the stylesheet over the XML. The XSLT stylesheet would look like this:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="3.0">
    <xsl:template match="node() | @*">
        <xsl:copy>
            <xsl:apply-templates select="node() | @*"/>
        </xsl:copy>
    </xsl:template>

</xsl:stylesheet>
```

XInclude 1.1 Features

Oxygen XML Editor offers partial support for XInclude 1.1 features. This includes support for fragment identifiers and attribute copying.

- **Fragment Identifiers**

  You can use `<xi:include>` to reference a text file and specify the `@fragid` value so that you only get part of that text file in the main document. For some examples and to see how the `<xi:include>` gets expanded when the `@fragid` specifies a line range or character range, see **Textual Inclusion Examples with RFC5147 Fragment Identifiers**.

- **Attribute Copying**

Any *namespaced* attribute defined on the `<xi:include>` element will be passed to the root element of the included content.

For example, if you have this:

```
<xi:include href="section2.xml" xmlns:xi="http://www.w3.org/2001/XInclude"
  set-xml-id="sectInner1"/>
```

and `section2.xml` looks like this:

```
<sect2 xmlns="http://docbook.org/ns/docbook" version="5.0"
    xmlns:xlink="http://www.w3.org/1999/xlink" xml:id="section2">
    <title>FS2</title>
    <para>P2</para>
</sect2>
```

then the final processed result will have the original `xml:id="section2"` replaced with the value specified in the *xi:included* section.

For more information, see **Attribute Copying when Processing XML**. Also, to see more examples, see **Attribute Copying Examples**.

W3C Specifications: XML Inclusions (XInclude) Version 1.1

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor includes a specialized **XML Refactoring** tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The **XML Refactoring** tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the **XML Refactoring** action from one of the following locations:

- The **Tools** menu.
- The **Refactoring** submenu from the contextual menu in the **Project** view *(on page 413)*.
- The **Refactoring** submenu from the contextual menu in the **DITA Maps Manager** view *(on page 3073)*.

Note:
The built-in refactoring operations are also available from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were finished *(on page 855)* or previewed *(on page 855)* also appear in the **Refactoring** submenu of the contextual menu in the **Project** view and the **DITA Maps Manager**.

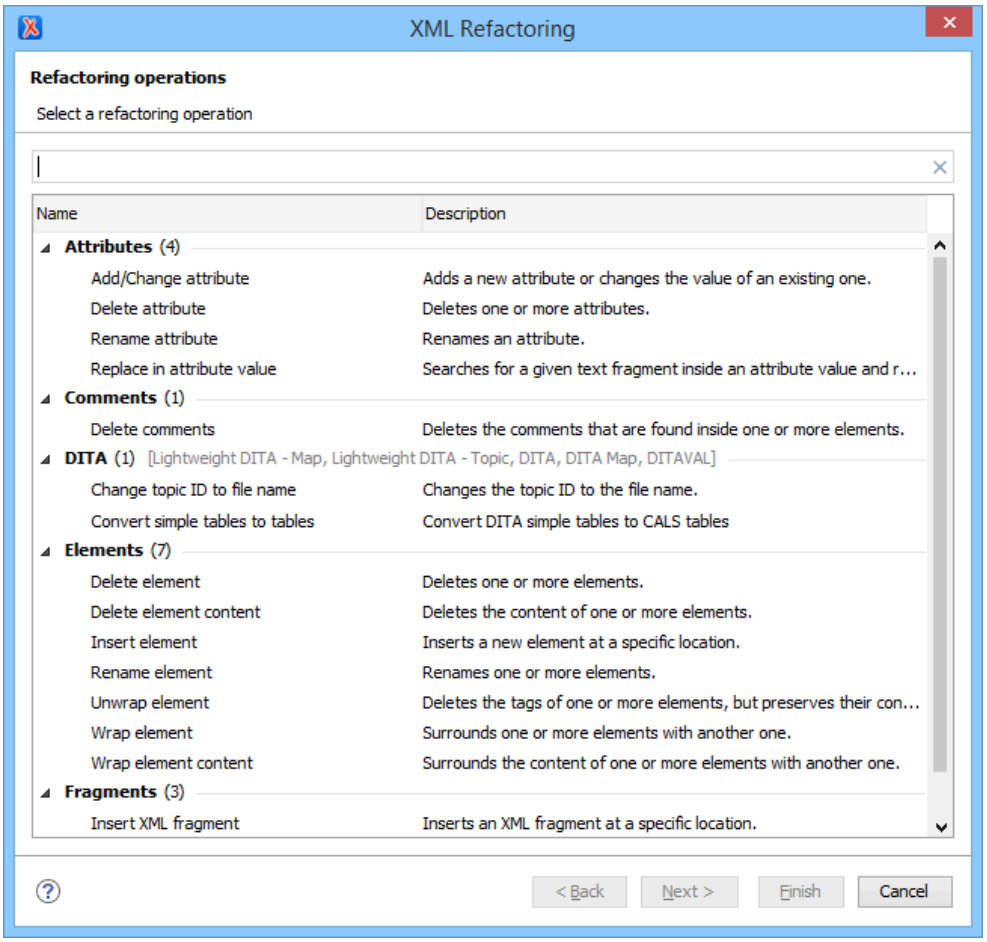
XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

Refactoring operations

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

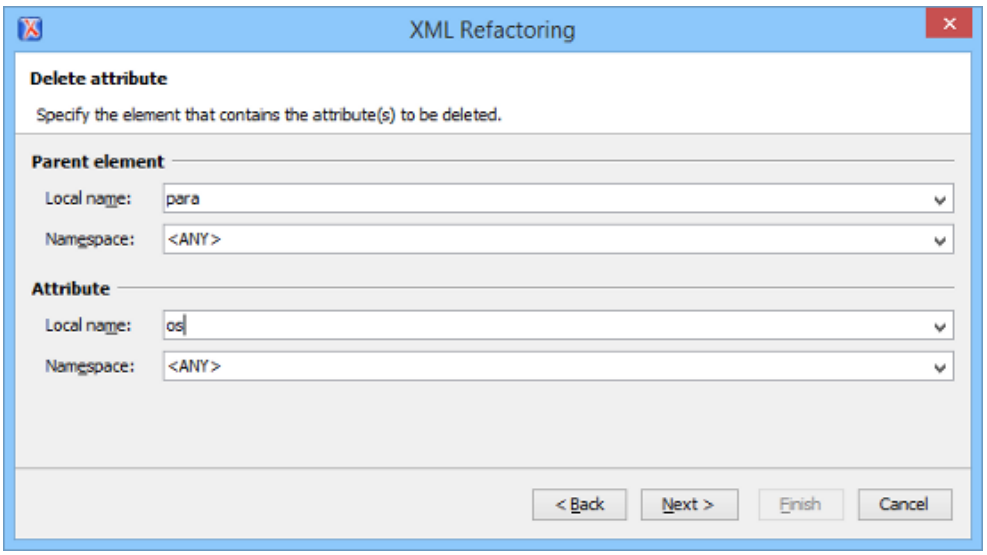
Figure 248. XML Refactoring Wizard



Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

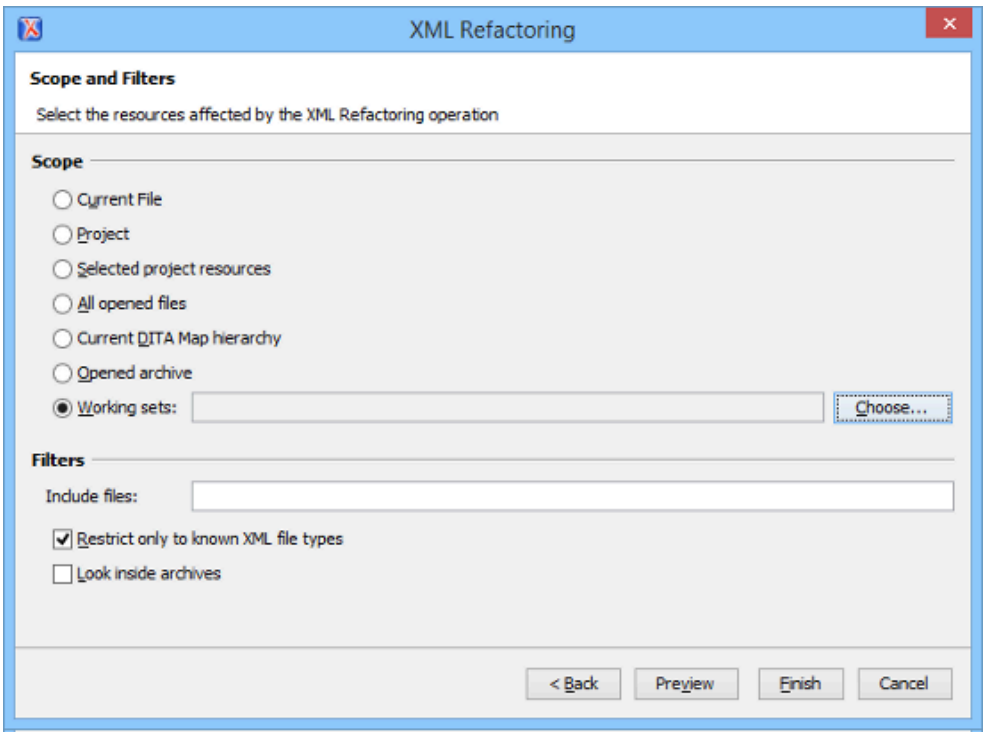
Figure 249. XML Refactoring 2nd Wizard Page (Delete Attribute Operation)



Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

Figure 250. XML Refactoring - Scope and Filters Wizard Page



Scope section

You can specify the scope for the operation by selecting from predefined resource sets or you can define your own set of resources by creating a *working set (on page 3425)* (select **Working sets** and click the **Choose** button to the right). If you select **Project**, all files attached to the current project will be used for the scope of the operation. If you select **Current DITA Map hierarchy**, the current DITA map that is open in the DITA Maps Manager along with all of its referenced topics and submaps (and topics referenced in those submaps) are used for the scope.

Filters

The **Filters** section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When selected, the resources inside archives will also be affected.

Preview

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

Finish

After clicking the **Finish** button, the operation will be processed and Oxygen XML Editor provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

Troubleshooting:
If an operation fails, a notification will be displayed in the **Results** panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

Tip:
If an operation takes longer than expected you can use the **Stop** button in the progress bar to cancel the operation.

Restriction:
XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

Built-in Refactoring Operations

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Tip:
Each operation includes a link in the lower part of the wizard that opens the **XML / XSLT-XQuery / XPath** preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

Refactoring Operations for *Attributes*

Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

Parent element section

Element

The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute section

Local name

The local name of the affected attribute.

Namespace

The namespace of the affected attribute.

Value

The value for the affected attribute.

Options section

You can choose between one of the following options for the **Operation mode**:

Add the attribute in the parent elements where it is missing

Adds the attribute to all instances of the specified parent element.

Change the value in the parent elements where the attribute already exists

Replaces the value of the already existing attribute in all instance of the specified parent element.

Both

Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.

Convert attribute to element

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

Parent element section

Element

The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute section

Local name

The local name of the affected attribute.

Namespace

The namespace of the affected attribute.

New element section

Local name

The local name of the new element.

Namespace

The namespace of the new element.

Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

Element

The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be deleted.

Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

Element

The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be renamed.

New local name

The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

Target attribute section

Element

The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be modified.

Find / Replace section

Find

The text fragments to find. You can use Perl-like regular expressions.

Replace with

The text fragment to replace the target with. This parameter can bind regular expression capturing groups (`$1`, `$2`, etc.) from the find pattern.

Refactoring Operations for *Comments*

Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

Element

The target element (or elements) that will have comments deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Note:
Comments that are outside the root element will not be deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *DITA* Topics

Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS tables to simple tables

Use this operation to convert DITA CALS tables to simple tables.

Convert DITA 1.3 Maps and Topics to DITA 2.0

Use this operation to convert topics and maps that adhere to the DITA 1.3 standard to the DITA 2.0 standard.

- Changes DOCTYPE declarations and XML Schema/Relax NG schema references.
- DITA Map changes:
  - Removes the `@lockmeta` attribute.
  - Removes the `<topicset>` and `<topicsetref>` elements.
  - Removes the `<anchor>` and `<anchorref>` elements and the `@anchorref` attribute.
  - Migrates the `@navtitle` attribute as a `<navtitle>` element.
  - Migrates the `@title` attribute as a `<title>` element.
  - Converts the `@copy-to` attribute to a `<resourceid>` element.
  - Replaces the `@print` attribute with an `@deliveryTarget` attribute.
  - Convert topicmeta `<linktext>` to `<linktitle>`.
  - Removed `<hasInstance>`, `<hasKind>`, `<hasNarrower>`, `<hasPart>`, `<hasRelated>`, and `<relatedSubjects>` from subject scheme relationship tables in subject scheme, including `<subjectRelTable>`, `<subjectRelHeader>`, `<subjectRel>`, and `<subjectRole>`.
- DITA task changes:
  - Converts the `<substep>` element to a `<step>` element.
  - Converts the `<substeps>` element to a `<steps>` element.
- DITA topic changes:
  - Removes the `@type` attribute with the value `fastpath`.
  - Converts the `@alt` attribute to an `<alt>` element.
  - Replaces the `<index-sort-as>` element with a `<sort-as>` element.
  - Removes the `<itemgroup>` element.
  - Moves the contents of the `<titlealts>` element inside the `<prolog>`.

- Removes the `@domains` attribute.
- Renames `<sectiondiv>` to `<div>`.
- Remove `@query` attribute from `<link>` element.
- Remove `@specentry` attribute from `<stentry>` element.

  Remove the `@spectitle` attribute.

Convert conrefs to conkeyrefs

Use this operation to convert `@conref` attributes to `@conkeyref` attributes. For more information and instructions for using this operation, see Converting Conrefs to Conkeyrefs *(on page 3222)*.

Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager *(on page 3073)*)

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager *(on page 3073)*)

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

Convert simple tables to CALS tables

Use this operation to convert DITA simple tables to CALS tables.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see Converting DITA Topics to Another Type *(on page 3147)*.

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see Converting DITA Topics to Another Type *(on page 3147)*.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see Converting DITA Topics to Another Type *(on page 3147)*.

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see Converting DITA Topics to Another Type *(on page 3147)*.

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see Converting DITA Topics to Another Type *(on page 3147)*.

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see Converting DITA Topics to Another Type *(on page 3147)*.

Rename Key

Use this operation to rename a key. It also updates all references to it.

Note:
It does not work on DITA 1.3 key scopes.

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Scope and Filters:

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as ***** or **?**).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Look inside archives

If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for *DITA* Maps

Convert DITA Bookmap to Map

Convert a DITA bookmap to a DITA map.

Convert DITA Map to Bookmap

Convert a DITA map to a DITA bookmap.

Change or remove profiling attribute value

Change or remove a value from a DITA profiling attribute. A profiling attribute can have multiple values, separated by spaces (e.g. for `platform="windows redhat"`, you can change the current `redhat` value to `linux`). Select the name of the profiling attribute, the current value to replace, and the new value. If the new value is left empty, the current value is removed from the profiling attribute. The new value is modified and reflected in DITA maps, DITA topics, and DITAVAL files.

Define keys for all topic references

This refactoring action is useful for converting links inside a DITA project from direct to indirect key-based addressing. When applied on DITA resources from your project (DITA maps and topics), this refactoring action defines keys for all of a DITA map's topic references based on the referenced file name and converts each direct reference to a key reference in each DITA topic. If a topic references already has keys defined, the action does not define new ones. Inside the DITA topics, whenever there is a link element (`<xref>` or `<link>`) with a direct reference to another DITA topic or an element with a `@conref`, the action attempts to convert them to indirect key-based addressing. The refactoring action may introduce linking errors or create duplicate keys so it is advised to run the **Validate and check for completeness** action from the **DITA Maps Manager** toolbar to manually fix those problems. You can enable the **Report duplicate keys** checkbox to also report any keys that are defined more than once.

Scope and Filters:

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as ***** or **?**).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Look inside archives

If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for *Elements*

Delete element

Use this operation to delete elements. This operation requires you to specify the following parameter:

Element

The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Delete element content

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

Element

The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Insert element

Use this operation to insert new elements. This operation allows you to specify the following parameters:

Element section

Local name

The local name of the element to be inserted.

Namespace

The namespace of the element to be inserted.

Location section

XPath

An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position

The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Rename element

Use this operation to rename elements. This operation requires you to specify the following parameters:

Target elements (XPath)

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

New local name

The new local name of the element.

Unwrap element

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

Target elements (XPath)

The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrap element

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name

The local name of the *Wrapper element*.

Namespace

The namespace of the *Wrapper element*.

Wrap element content

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name

The local name of the *Wrapper element* that will surround the content of the target.

Namespace

The namespace of the *Wrapper element* that will surround the content of the target.

Refactoring Operations for *Fragments*

Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

XML Fragment

The XML fragment to be inserted.

Location section

XPath

An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position

The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the target element.

Refactoring Operations for *JATSKit*

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these *JATSKit* refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope for the resources that will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as ***** or **?**).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Look inside archives

If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for *Processing Instructions*

Accept all tracked changes, remove all Oxygen-specific comments and highlights

Use this operation to accept all application-specific tracked changes (from elements and attributes) or remove all application-specific comments or highlights. There are several options to choose from:

Accept all tracked changes

Accepts all application-specific tracked changes (from elements and attributes).

Remove comments

Removes all application-specific comments.

Remove highlights

Removes all application-specific highlights.

Delete processing instructions

Use this operation to delete all processing instructions that have a certain target name from the processed documents. This operation requires you to specify the following parameter:

Processing instruction target

The target name of the processing instructions to delete.

Note:
Processing instructions that are outside the root element are not deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *Publishing Template*

These operations are for those who use *Oxygen Publishing Templates* for WebHelp Responsive output customization.

Migrate HTML Page Layout Files to v21

Use this operation to convert custom HTML page layout files *(on page 1677)* that are included in a custom Publishing Template that was created in Oxygen XML Editor version 20.0 or 20.1 so that they will be compatible with Oxygen XML Editor version 21.0.

Migrate HTML Page Layout Files to v22

Use this operation to convert custom HTML page layout files *(on page 1677)* that are included in a custom Publishing Template that was created in Oxygen XML Editor versions 20.0 - 21.1 so that they will be compatible with Oxygen XML Editor version 22.0.

Update HTML Pages

Attention:
This operation is only used by Oxygen XML Editor and should not be used manually.

Additional Notes:

- There are some operations that allow `<ANY>` for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<NO_NAMESPACE>` value can be used to select nodes that do not belong to a namespace.
- Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the **Options > Preferences > XML > XSLT-XQUERY > XPath** *(on page 267)* page. This preferences page can be easily opened by clicking the link in the note (**Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section**) at the bottom of the **Configure Operation Parameters** wizard page.

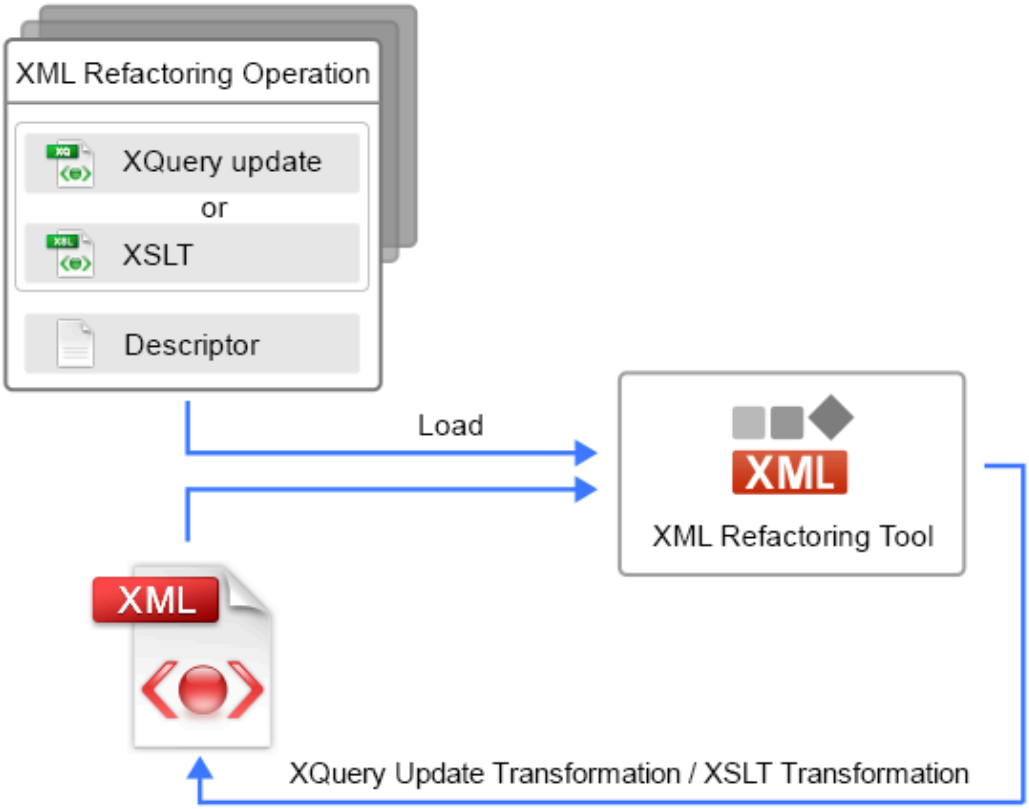
Custom Refactoring Operations

While Oxygen XML Editor includes a variety of built-in XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An *XQuery Update script* or *XSLT stylesheet* that Oxygen XML Editor will run to refactor the XML files.
- An *XML Operation Descriptor* file that contains information about the operation (such as the name, description, and parameters).

Figure 251. Diagram of an XML Refactoring Operation



All the defined custom operations are loaded by the **XML Refactoring Tool** and presented in the **Refactoring Operations** wizard page *(on page 853)*, along with the built-in operations.

After the user chooses an operation and specifies its parameters, Oxygen XML Editor processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a **safe mode**, which implies the following:

- When loading the document:
  - The **XInclude** mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
  - The DTD entities will be processed without being expanded.
  - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.
- When saving the updated XML document:
  - The `DOCTYPE` will be preserved.

    Note:
    This can be changed using Saxon extension functions in XSLT *(on page 886)*.

  - The DTD entities will be preserved as they are in the original document when the document is saved.

- The attribute values will be kept in their original form without being normalized.
- The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

Note:
To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the `http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes` namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.

Restriction:
Comments or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be applied on the root element and the nodes inside it. However, as a work around to this limitation, you can use Saxon extension functions and the XSLT stylesheet method *(on page 886)* to implement the new custom XML refactoring operation.

Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:

1. Create an XQuery Update script *(on page 876)* or XSLT stylesheet file *(on page 881)*.
2. Create an XML refactoring operation descriptor file, that references the above script, as explained in these sections: Example descriptor file for an XQuery Update script *(on page 879)* or Example descriptor file for an XSLT stylesheet *(on page 884)*.
3. Store both files in one of the locations that Oxygen XML Editor *(on page 888)* scans when loading the custom operations.

   Result: Once you run the **XML Refactoring** tool again, the custom operation appears in the **Refactoring Operations** wizard page *(on page 853)*.

Related information
Storing and Sharing Refactoring Operations *(on page 888)*

Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an XQuery Update script *(on page 876)* or XSLT stylesheet *(on page 881)* that is needed to process the refactoring operations. The easiest way to create this script file is to use the **New** document wizard to create a new **XQuery** or **XSLT** file and you can use

the XQuery method example *(on page 876)* or XSLT method example *(on page 881)* to help you with the content.

There are cases when it is necessary to add parameters in the XQuery script *(on page 876)* or XSLT stylesheet *(on page 881)*. For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the *refactoring operation descriptor file* that is associated with this operation.

Note:
The XQuery Update processing is disabled by default in Oxygen XML Editor. Thus, if you want to create or edit an XQuery Update script you have to enable this mechanism by creating an XQuery transformation scenario *(on page 1588)* and choose **Saxon EE** as the transformation engine. Also, you need to make sure the **Enable XQuery update** option is selected in the Saxon processor advanced options *(on page 1525)*.

Note:
If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the **XML /XSLT-XQuery / XPath** preferences page *(on page 267)*.

The next step in creating a custom refactoring operation is to create an **XML Refactoring Operation Descriptor** file contains the path to the XQuery Update script *(on page 879)* or XSLT stylesheet *(on page 884)*.

Related Information:
XQuery Update Script for Creating a Custom Operation *(on page 876)*
XSLT Stylesheet for Creating a Custom Operation *(on page 881)*

Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the **New** document wizard and choose the **XML Refactoring Operation Descriptor** template.

Introduction to the Descriptor File

This descriptor file root element specifies required attributes to define the operation `@name`, `@description`, and `@id` which are necessarily when loading an XML Refactoring operation. It also contains the path to the XQuery Update script *(on page 876)* or XSLT stylesheet *(on page 881)* that is associated with the particular operation through the `<script>` element.

The optional `@filesFilter` attribute can be specified to filter the resources by using a file pattern or list of file patterns separated by a comma (for example: `filesFilter="*.dita, *.xml"`). When set, its value is

automatically populated in the **Include files** field within the **Scope and Filters** wizard page *(on page 855)* as a default value.

You can specify a *category* for your custom operations to logically group certain operations. The `<category>` element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is *Other operations*.

The descriptor file is edited and validated against the following schema: `frameworks/xml_refactoring/operation_descriptor.xsd`.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the **parameters** section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the **XML Refactoring** tool within the **Configure Operation Parameters** wizard page *(on page 854)* for that particular operation.

The value of the first `<description>` element in the `<parameters>` section will be displayed at the top of the **Configure Operation Parameters** wizard page *(on page 854)*.

To declare a parameter, specify the following information:

- **label** - This value is displayed in the user interface for the parameter.
- **name** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- **type** - Defines the type of the parameter and how it will be rendered. There are several types available:
  - **TEXT** - Generic type used to specify a simple text fragment.
  - **XPATH** - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor will use a text input with corresponding content completion and syntax highlighting.

Note:
The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.

Note:
A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.

Note:
When writing XPath expressions, you can only use prefixes declared in the **Options > Preferences > XML > XSLT-XQuery > XPath** *(on page 267)* options page.

- **NAMESPACE** - Used for editing namespace values.
- **REG_EXP_FIND** - Used when you want to match a certain text by using Perl-like regular expressions.
- **REG_EXP_REPLACE** - Used along with `REG_EXP_FIND` to specify the replacement string.
- **XML_FRAGMENT** - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor will display a text area specialized for inserting XML documents.
- **NC_NAME** - The parameter for `NC_NAME` values. It is useful when you want to specify the local part of a *QName (on page 3423)* for an element or attribute.
- **BOOLEAN** - Used to edit boolean parameters.
- **TEXT_CHOICE** - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor renders each possible value as a radio button option.

- **optional** - Specifies whether the parameter is optional or required. For optional parameters, the end user is not required to fill in a value in the XML refactoring wizard.
- **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.
- **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```
<possibleValues onlyPossibleValuesAllowed="true">
    <value name="before">Before</value>
    <value name="after" default="true">After</value>
    <value name="firstChild">First child</value>
    <value name="lastChild">Last child</value>
</possibleValues>
```

On a `<value>`, you can specify the `@default` attribute with the value `true` to mark it as the default presented value in the XML refactoring wizard. The text specified inside the `<value>` element is displayed as placeholder default text in the text entry box. If the dialog box is accepted with the placeholder text in place, the `@name` attribute value is passed to the refactoring script. Example:

```
<value name="my-actual-default-value" default="true">[default displayed]</value>
```

Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

elementLocation

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the `@label` attribute is displayed in the application as the label of the text field. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the `@useCurrentContext` attribute is set to **true**, the element name from the cursor position is used as proposed values for this parameter.

Example of an `<elementLocation>`:

```
<elementLocation name="elem_loc" useCurrentContext="false">
                <element label="Element location">
                    <description>Element location description.</description>
                </element>
</elementLocation>
```

attributeLocation

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the `@label` attributes is displayed in the application as the label of the associated text fields. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the *element* and *attribute* text fields. For example, if `section` is entered for the element and a `title` is entered for the attribute, the XPath expression would be computed as `//section/@title`. If the value of the `useCurrentContext` attribute is set to `true`, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an `<attributeLocation>`:

```
<attributeLocation name="attr_xpath" useCurrentContext="true">
                <element label="Element path">
                    <description>Element path description.</description>
                </element>
                <attribute label="Attribute" >
                    <description>Attribute path description.</description>
                </attribute>
</attributeLocation>
```

elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the `@label` attribute is displayed in the application as label of the associated combo. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you

specify the `@allowsAny` attribute, the application will propose *<ANY>* as a possible value for the **Name** and **Namespace** combo boxes. You can also use the `@useCurrentContext` attribute and if its value is set to `true`, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an `<elementParameter>`:

```
<elementParameter id="elemID" useCurrentContext="true">
    <localName label="Name" name="element_localName" allowsAny="true">
        <description>Local name of the parent element.</description>
    </localName>
    <namespace label="Namespace" name="element_namespace" allowsAny="true">
        <description>Local name of the parent element</description>
    </namespace>
</elementParameter>
```

attributeParameter

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the `@label` attribute is displayed in the application as the label of the associated combo box. You can also use the `@useCurrentContext` attribute and if its value is set to `true`, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

Note:
An `<attributeParameter>` is dependant upon an `<elementParameter>`. The list of attributes and namespaces are computed based on the selection in the *elementParameter* combo boxes.

Example of an `<attributeParameter>`:

```
<attributeParameter dependsOn="elemID" useCurrentContext="true">
    <localName label="Name" name="attribute_localName">
        <description>The name of the attribute to be converted.</description>
    </localName>
    <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
        <description>Namespace of the attribute to be converted.</description>
    </namespace>
</attributeParameter>
```

Grouping Parameters in the Descriptor File

You can use `<section>` elements to group related parameters in the descriptor file:

```
<section label="Parent element">
  <elementParameter id="elemID">
    <localName label="Name" name="element_localName" allowsAny="true">
      <description>Local name of the parent element.</description>
    </localName>
    <namespace label="Namespace" name="element_namespace" allowsAny="true">
      <description>Local name of the parent element</description>
    </namespace>
  </elementParameter>
</section>
```

Note:
All built-in operations are loaded from the *[OXYGEN_INSTALL_DIR]*`/refactoring` folder.

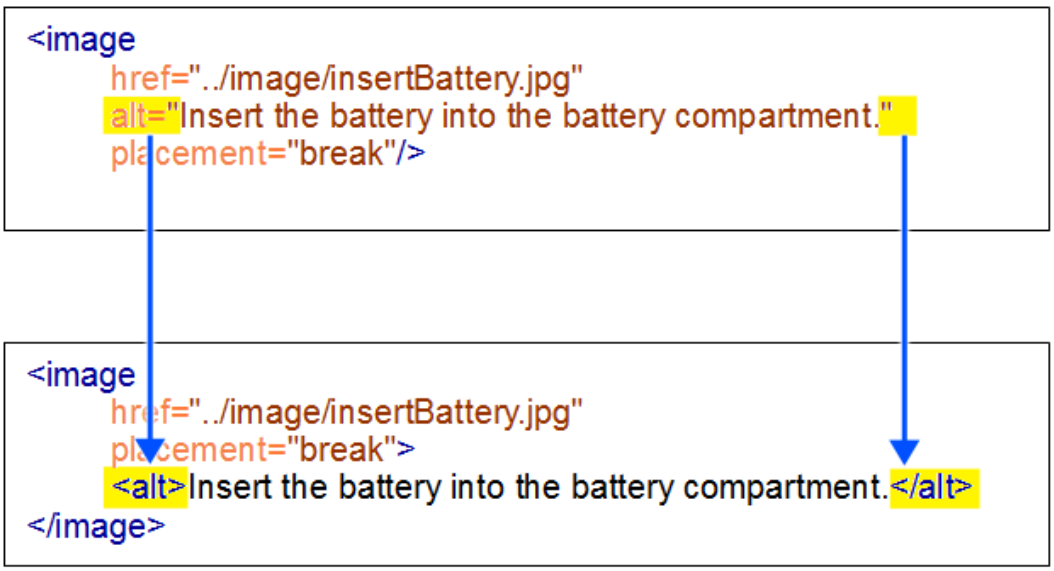
Example of an Operation Descriptor File with an XQuery Update script *(on page 879)*

XQuery Update Script for Creating a Custom Operation

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `<image>` elements where a deprecated `@alt` attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `<image>` element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure 252. Example: Custom XML Refactoring Operation



An XQuery Update script can be used to implement the new custom XML refactoring operation. The second requirement is an XML Refactoring operation descriptor file *(on page 879)* that contains the path to the XQuery Update script.

Restriction:
There is a limitation to using an XQuery script in that *comments* or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be performed on *comments* or *processing instructions* that are inside the root element. However, as a work around to this limitation, you can use Saxon extension functions and the XSLT stylesheet method *(on page 886)* to implement the new custom XML refactoring operation.

Example of an XQuery Update Script for Creating a Custom Operation to *Convert an Attribute to an Element*

The XQuery Update script does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Computes the *QName (on page 3423)* of the new element to be inserted and inserts it as the first child of the parent element.

```
(:
    XQuery document used to implement 'Convert attribute to element'
      operation from XML Refactoring tool.
:)
```

```
declare namespace output = "http://www.w3.org/2010/xslt-xquery-serialization";
declare option output:method   "xml";
declare option output:indent   "no";

(: Local name of the attribute's parent element. :)
declare variable $element_localName as xs:string external;

(: Namespace of the attribute's parent element. :)
declare variable $element_namespace as xs:string external;

(: The local name of the attribute to be converted :)
declare variable $attribute_localName as xs:string external;

(: The namespace of the attribute to be converted :)
declare variable $attribute_namespace as xs:string external;

(: Local name of the new element. :)
declare variable $new_element_localName as xs:string external;

(: Namespace of the new element. :)
declare variable $new_element_namespace as xs:string external;

(: Convert attribute to element:)
for $node in //*
(: Find the attribute to convert :)
let $attribute :=
    $node/@*[local-name() = $attribute_localName and
    ($attribute_namespace = '<ANY>' or $attribute_namespace = namespace-uri())]

(: Compute the prefix for the new element to insert :)
let $prefix :=
    for $p in in-scope-prefixes($node)
      where $new_element_namespace = namespace-uri-for-prefix($p, $node)
return $p

(: Compute the qname for the new element to insert :)
let $new_element_qName :=
    if (empty($prefix) or $prefix[1] = '') then $new_element_localName
    else $prefix[1] || ':' || $new_element_localName

 where ('<ANY>' = $element_localName or local-name($node) = $element_localName)
   and
```

```
($element_namespace = '<ANY>' or $element_namespace = namespace-uri($node))

 return
   if (exists($attribute)) then
     (insert node element {QName($new_element_namespace, $new_element_qName)}
     {string($attribute)} as first into $node,
     delete node $attribute)
     else ()
```

Example of an Operation Descriptor File That References the XQuery Script for Creating a Custom Operation to *Convert an Attribute to an Element*

After you have developed the XQuery script (for example, named `convert-attribute-to-element.xq`), you have to create an XML Refactoring operation descriptor (for example, named `convert-attribute-to-element.xml`) that references the stylesheet and provides descriptions and possible values for its parameters. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
 id="convert-attribute-to-element"
 name="Convert attribute to element">
 <description>Converts the specified attribute to an element.
           The new element will be inserted as first child of the attribute's
           parent element.</description>
 <script type="XQUERY_UPDATE" href="convert-attribute-to-element.xq"/>
  <parameters>
   <description>Specify the attribute to be converted to element.</description>
    <section label="Parent element">
     <elementParameter id="elemID">
      <localName label="Name" name="element_localName" allowsAny="true">
       <description>Local name of the parent element.</description>
        </localName>
       <namespace label="Namespace" name="element_namespace" allowsAny="true">
         <description>Local name of the parent element</description>
       </namespace>
     </elementParameter>
    </section>
    <section label="Attribute">
     <attributeParameter dependsOn="elemID">
      <localName label="Name" name="attribute_localName">
```

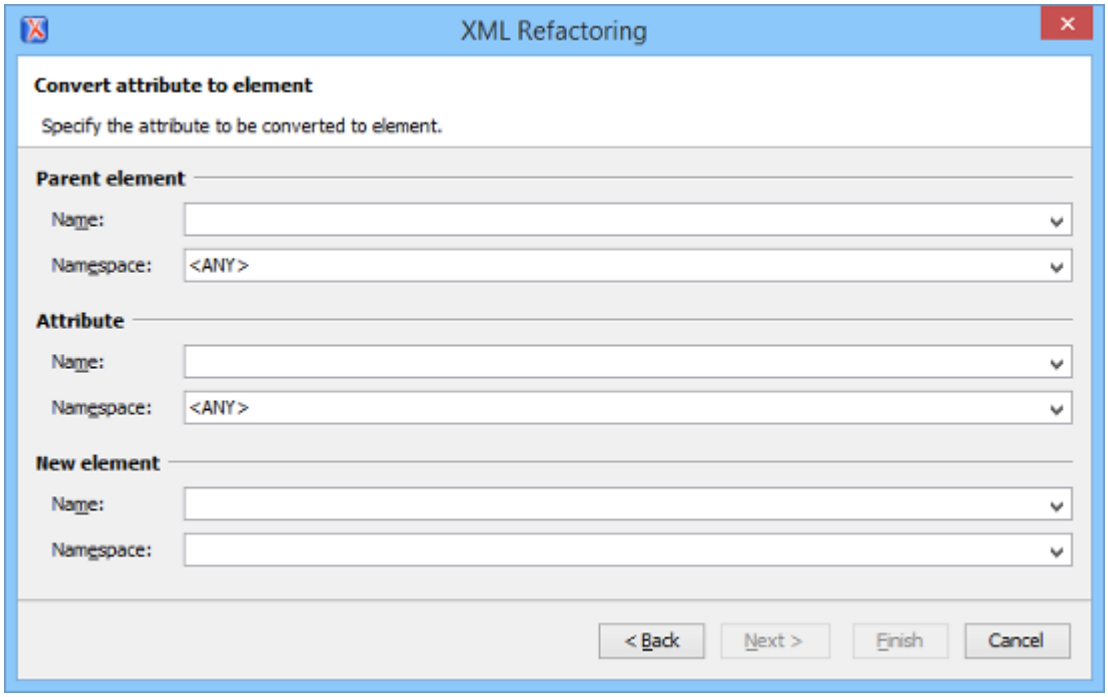
```
      <description>Name of the attribute to be converted.</description>
     </localName>
    <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
      <description>Namespace of the attribute to be converted.</description>
    </namespace>
    </attributeParameter>
   </section>
   <section label="New element">
       <elementParameter>
          <localName label="Name" name="new_element_localName">
              <description>The name of the new element.</description>
          </localName>
          <namespace label="Namespace" name="new_element_namespace">
              <description>The namespace of the new element.</description>
          </namespace>
       </elementParameter>
   </section>
  </parameters>
</refactoringOperationDescriptor>
```

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor when it loads the custom operation *(on page 888)*. When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:

Figure 253. Example: XML Refactoring Wizard for a Custom Operation



Debugging XQuery Refactoring Operations

You can use the XQuery trace() function to generate debugging information messages in the application's **Results** view *(on page 558)*.

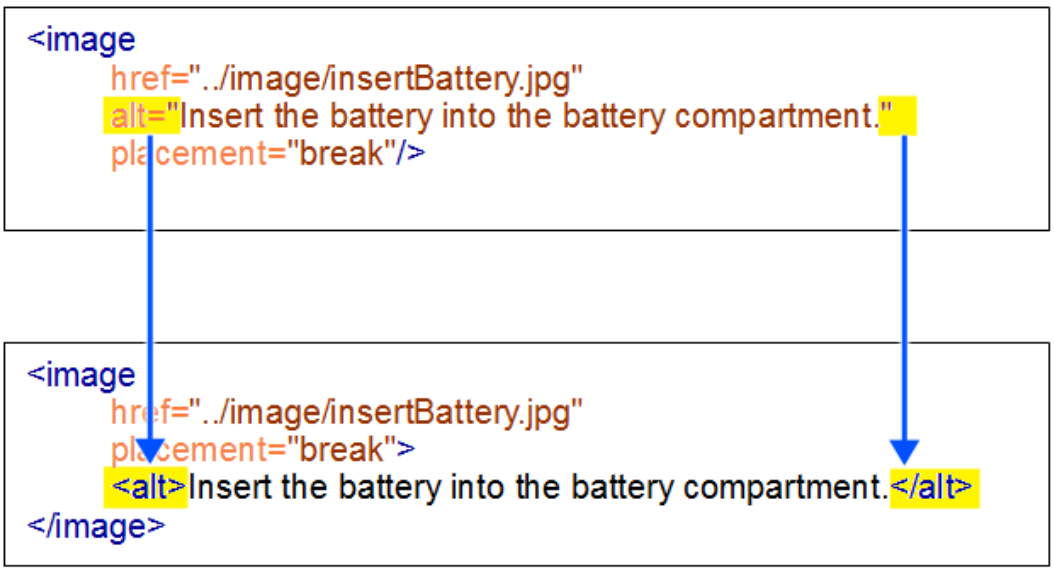
The Saxon processor used for XQuery update processing also supports the EXPath extensions, which also allow you to write debugging information to an output file.

XSLT Stylesheet for Creating a Custom Operation

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `<image>` elements where a deprecated `@alt` attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `<image>` element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure 254. Example: Custom XML Refactoring Operation



An XSLT stylesheet can be used to implement the new custom XML refactoring operation. The second requirement is an XML Refactoring operation descriptor file *(on page 884)* that contains the path to the XSLT stylesheet.

Example of an XSLT Script for Creating a Custom Operation to *Convert an Attribute to an Element*

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
  version="2.0">

  <xsl:import
href="http://www.oxygenxml.com/ns/xmlRefactoring/resources/commons.xsl"/>

  <xsl:param name="element_localName" as="xs:string" required="yes"/>
  <xsl:param name="element_namespace" as="xs:string" required="yes"/>
  <xsl:param name="attribute_localName" as="xs:string" required="yes"/>
  <xsl:param name="attribute_namespace" as="xs:string" required="yes"/>
  <xsl:param name="new_element_localName" as="xs:string" required="yes"/>
```

```
<xsl:param name="new_element_namespace" as="xs:string" required="yes"/>

<xsl:template match="node() | @*">
    <xsl:copy>
        <xsl:apply-templates select="node() | @*"/>
    </xsl:copy>
</xsl:template>
<xsl:template match="//*[xr:check-local-name($element_localName, ., true())
   and
      xr:check-namespace-uri($element_namespace, .)]">

    <xsl:variable name="attributeToConvert"
       select="@*[xr:check-local-name($attribute_localName, ., true())
   and
      xr:check-namespace-uri($attribute_namespace, .)]"/>

    <xsl:choose>
        <xsl:when test="empty($attributeToConvert)">
            <xsl:copy>
                <xsl:apply-templates select="node() | @*"/>
            </xsl:copy>
        </xsl:when>
    <xsl:otherwise>
        <xsl:copy>
            <xsl:for-each select="@*[empty(. intersect $attributeToConvert)]">
                 <xsl:copy-of select="."/>
            </xsl:for-each>
              <!-- The new element namespace -->
              <xsl:variable name="nsURI" as="xs:string">
                  <xsl:choose>
         <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">
                        <xsl:value-of select="''"/>
                    </xsl:when>
                    <xsl:otherwise>
                        <xsl:value-of select="$new_element_namespace"/>
                    </xsl:otherwise>
                  </xsl:choose>
             </xsl:variable>
        <xsl:element name="{$new_element_localName}" namespace="{$nsURI}">
                  <xsl:value-of select="$attributeToConvert"/>
             </xsl:element>
            <xsl:apply-templates select="node()"/>
```

```
        </xsl:copy>
      </xsl:otherwise>
    </xsl:choose>
  </xsl:template>
</xsl:stylesheet>
```

Note:
The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an *XML Catalog (on page 3425)* set in the XML Refactoring *framework (on page 3420)*.

Example of an Operation Descriptor File That References the XSLT Stylesheet for Creating a Custom Operation to *Convert an Attribute to an Element*

After you have developed the XSLT stylesheet (for example, named `convert-attribute-to-element.xsl`), you have to create an XML Refactoring operation descriptor (for example, named `convert-attribute-to-element.xml`) that references the stylesheet and provides descriptions and possible values for its parameters. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
 id="convert-attribute-to-element"
 name="Convert attribute to element">
 <description>Converts the specified attribute to an element.
          The new element will be inserted as first child of the attribute's
          parent element.</description>
 <script type="XSLT" href="convert-attribute-to-element.xsl"/>
  <parameters>
   <description>Specify the attribute to be converted to element.</description>
    <section label="Parent element">
     <elementParameter id="elemID">
      <localName label="Name" name="element_localName" allowsAny="true">
       <description>Local name of the parent element.</description>
        </localName>
       <namespace label="Namespace" name="element_namespace" allowsAny="true">
         <description>Local name of the parent element</description>
       </namespace>
     </elementParameter>
    </section>
```

```
    <section label="Attribute">
     <attributeParameter dependsOn="elemID">
      <localName label="Name" name="attribute_localName">
       <description>Name of the attribute to be converted.</description>
      </localName>
     <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
       <description>Namespace of the attribute to be converted.</description>
     </namespace>
     </attributeParameter>
    </section>
    <section label="New element">
        <elementParameter>
           <localName label="Name" name="new_element_localName">
               <description>The name of the new element.</description>
           </localName>
           <namespace label="Namespace" name="new_element_namespace">
               <description>The namespace of the new element.</description>
           </namespace>
        </elementParameter>
    </section>
  </parameters>
</refactoringOperationDescriptor>
```

Note:

If you are using an XSLT file, the line with the `<script>` element would look like this:

```
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

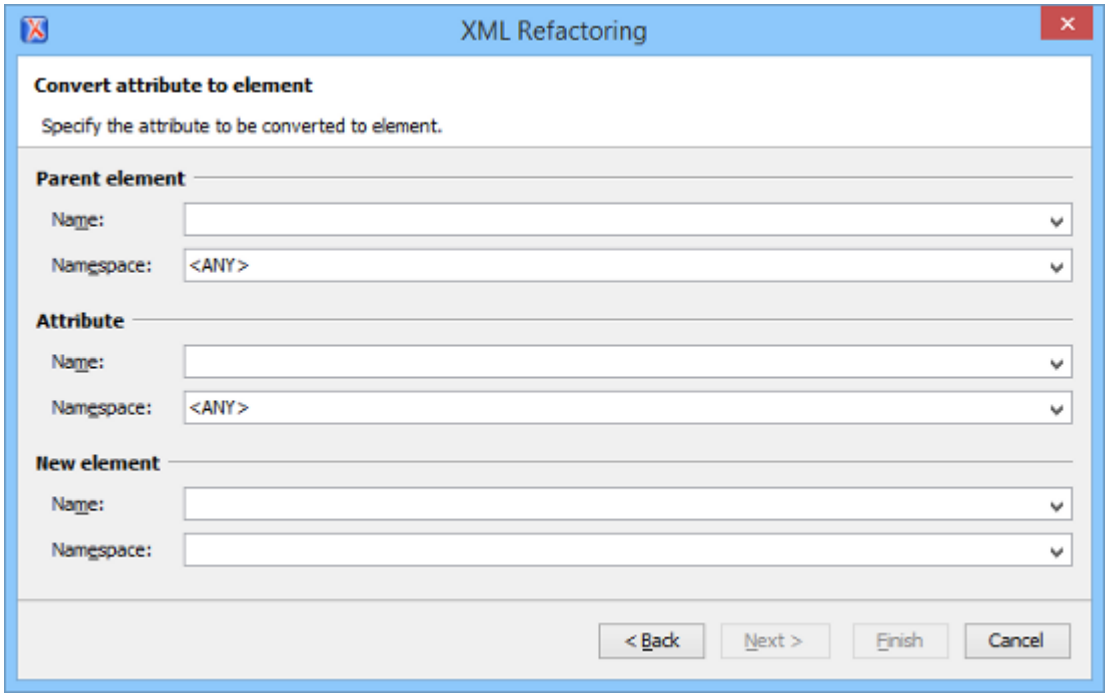
The code exemplified above and other refactoring examples can be found on the DITA Refactoring GitHub sample project.

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor when it loads the custom operation *(on page 888)*. When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:

Figure 255. Example: XML Refactoring Wizard for a Custom Operation



Using Saxon Extension Functions to Allow Custom Refactoring Operations to Read and Modify Content Outside the Root Node

One advantage to using an XSLT stylesheet is that there is limitation when using an XQuery Update script *(on page 876)* in that refactoring operations can only be performed on *comments* or *processing instructions* that are inside the root element. Thus, using the XQuery method, *comments* or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation.

The XSLT stylesheet method offers a work-around to this limitation through the use of some Saxon extension functions.

To illustrate the use of these functions, consider the following sample XML file:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
    <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

The following Saxon extension functions can be used to read and modify content outside the root node:

Note:
They belong to the `http://www.oxygenxml.com/ns/xmlRefactoring/functions` namespace.

- **get-content-after-root()** - Returns the content after root as `xs:string`.

  For the XML above, the call of this function will return the following string value:

  ```
  <!-- comment after root -->
  <?pi after root ?>
  ```

- **set-content-after-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

  The function call `set-content-after-root('<!-- Inserted comment -->')` will result in replacing the nodes after the root element with the comment passed as string argument. The XML document will be modified as follows:

  ```
  <?xml version="1.0" encoding="UTF-8"?>
  <!-- comment before root -->
  <?pi before root ?>
  <root>
      <child></child>
  </root><!-- Inserted comment -->
  ```

- **get-content-before-root()** - Returns the content before root as `xs:string`.

  For the XML above, the call of this function will return the following string value:

  ```
  <?xml version="1.0" encoding="UTF-8"?>
  <!-- comment before root -->
  <?pi before root ?>
  ```

- **set-content-before-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

  The function call `set-content-before-root('<!-- Inserted comment -->')` will result in replacing the nodes before the root element with the comment passed as string argument. The XML document will be modified as follows:

  ```
  <!-- Inserted comment --><root>
      <child></child>
  </root>
  <!-- comment after root -->
  <?pi after root ?>
  ```

XSLT Example:

To process content after the root node, the XSLT would look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="xs"
```

```
    xmlns:xrf="http://www.oxygenxml.com/ns/xmlRefactoring/functions" version="3.0">
    <xsl:template match="/">
        <!-- The comment content that will be inserted after the root element -->
        <xsl:variable name="commentAsText"><!-- COMMENT ADDED FROM XR OPERATION-->
        </xsl:variable>
        <!-- Retrieve the content after the root element as is -->
        <xsl:variable name="after-root-content" as="xs:string"
                      select="xrf:get-content-after-root()"/>

        <xsl:variable name="processedContent"
                      select="concat($after-root-content, $commentAsText)"/>

        <!-- Update the content after the root element -->
        <xsl:value-of select="xrf:set-content-after-root($processedContent)"/>

        <xsl:apply-templates/>
    </xsl:template>

    <xsl:template match="node() | @*">
        <xsl:copy>
            <xsl:apply-templates select="node() | @*"/>
        </xsl:copy>
    </xsl:template>
</xsl:stylesheet>
```

Note:
The above XSLT retrieves the nodes after the root element as string, appends a new comment, and then sets back the updated content into the XML document.

Storing and Sharing Refactoring Operations

Oxygen XML Editor scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A folder named `refactoring`, created inside the folder of the *framework* you are customizing. In the **Classpath** tab of the **Document type** configuration dialog box *(on page 152)*, you need to add a reference to the `refactoring` folder specific for the framework.
- A folder that you specify in the **Load additional refactoring operations from** text box *(on page 277)* in the **XML Refactoring** preferences page *(on page 277)*.

Note:
If you share a project with your team, you can also share the custom operation by doing the following:

1. Save the custom operation in a folder that is part of your project.
2. Switch the **XML Refactoring** option page to project level *(on page 3423)*:
    a. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XML Refactoring** *(on page 277)*.
    b. Select **Project Options** *(on page 3423)* at the bottom of the dialog box.
3. In the **Load additional refactoring operations from** text box *(on page 277)*, use the *${pd}* editor variable *(on page 340)* so that the folder path is declared relative to the project.

- A folder specified by the XML Refactoring Operations Plugin Extension *(on page 2552)*.
- The `refactoring` folder from the Oxygen XML Editor installation directory (*`[OXYGEN_INSTALL_DIR]/refactoring/`*).

Sharing Custom Refactoring Operations

The purpose of Oxygen XML Editor scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as *framework (on page 3420)* or projects.

After storing custom operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Editor includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in *`[OXYGEN_INSTALL_DIR]/refactoring/i18n/translation.xml`*.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation `name`, `description`, and `category`.
- The `<description>` of the `<parameters>` element.
- The `label`, `description`, and `possibleValues` for each `parameter`.

Translated refactoring information uses the following form:

```
${i18n(translation_key)}
```

Oxygen XML Editor scans the following locations to find the `translation.xml` files that are used to load the translation keys:

- A `refactoring/i18n` folder, created inside a directory that is associated to a customized *framework*.
- A `i18n` folder, created inside a directory that is associated to a customized *framework*.
- An `i18n` folder inside any specified folder. In this case, you need to open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **XML > XML Refactoring**, and specify the folder in the **Load additional refactoring operations from** text box.
- An `i18n` folder located in directories specified through the XML Refactoring Operations Plugin Extension *(on page 2552)*.
- The `refactoring/i18n` folder from the Oxygen XML Editor installation directory (*`[OXYGEN_INSTALL_DIR]`*`/refactoring/i18n`).

Example: Refactoring Operation Descriptor File with *i18n* Support

```
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
    xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"
           name="${i18n(Remove_text_content)}">
    <description>${i18n(Remove_text_content_description)}</description>
    <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>
    <parameters>
        <description>${i18n(parameters_description)}</description>
        <parameter label="${i18n(Element_name)}" name="element_localName"
                      type="NC_NAME">
            <description>${i18n(Element_name_descriptor)}</description>
            <possibleValues>
                <value default="true" name="value1">${i18n(value_1)}</value>
                <value name="value2">${i18n(value_2)}</value>
            </possibleValues>
        </parameter>
    </parameters>
</refactoringOperationDescriptor>
```

XML Digital Signatures

This chapter explains how to apply and verify digital signatures on XML documents.

Digital Signatures Overview

Digital signatures are widely used as security tokens, not just in XML. A *digital signature* provides a mechanism for assuring integrity of data, the authentication of its signer, and the non-repudiation of the entire signature to an external party:

- A *digital signature* must provide a way to verify that the data has not been modified or replaced to ensure integrity.
- The *signature* must provide a way to establish the identity of the data's signer for authentication.
- The *signature* must provide the ability for the data's integrity and authentication to be provable to a third party for non-repudiation.

A *public key system* is used to create the digital signature and it is also used for verification. The signature binds the signer to the document because digitally signing a document requires the originator to create a hash of the message and then encrypt that hash value with their own private key. Only the originator has that private key and that person is the only one who can encrypt the hash so that it can be unencrypted using their public key. The recipient, upon receiving both the message and the encrypted hash value, can decrypt the hash value, knowing the originator's public key. The recipient must also try to generate the hash value of the message and compare the newly generated hash value with the unencrypted hash value received from the originator. If the hash values are identical, it proves that the originator created the message, because only the actual originator could encrypt the hash value correctly.

XML Signatures can be applied to any digital content (data object), including XML (see W3C Recommendation, XML-Signature Syntax and Processing). An XML Signature may be applied to the content of one or more resources:

- Enveloped or enveloping signatures are applied over data within the same XML document as the signature
- Detached signatures are applied over data external to the signature element; the signature is "detached" from the content it signs. This definition typically applies to separate data objects, but it also includes the instance where the signature and data object reside within the same XML document but are sibling elements.

The *XML Signature* is a method of associating a key with referenced data. It does not normatively specify how keys are associated with persons or institutions, nor the meaning of the data being referenced and signed.

The original data is not actually signed. Instead, the signature is applied to the output of a chain of *canonicalization (on page 3418)* and transformation algorithms, which are applied to the data in a designated sequence. This system provides the flexibility to accommodate whatever "normalization" or desired preprocessing of the data that might be required or desired before subjecting it to being signed.

Since the signature is dependent on the content it is signing, a signature produced from a *non-canonicalized* document could possibly be different from one produced from a *canonicalized (on page 3418)* document. The *canonical (on page 3418)* form of an XML document is physical representation of the document produced by the method described in this specification. The *XML canonicalization (on page 3418)* method is the algorithm defined by this specification that generates the canonical form of a given XML document or document subset. *XML canonicalization* is designed to be useful for applications that require the ability to test whether or not the information content of a document or document subset has been changed. This is done by comparing the *canonical* form of the original document before application processing with the *canonical* form of the document result of the application processing.

A digital signature over the *canonical (on page 3418)* form of an XML document or document subset allows the signature digest calculations to be oblivious to changes in the original document's physical representation. During signature generation, the digest is computed over the *canonical* form of the document. The document is then transferred to the relying party, which validates the signature by reading the document and computing a digest of the *canonical* form of the received document. The equivalence of the digests computed by the signing and relying parties (hence, the equivalence of the *canonical* forms that they were computed for) ensures that the information content of the document has not been altered since it was signed.

The following *canonicalization algorithms* are used in Oxygen XML Editor:

- **Canonical XML (or Inclusive XML Canonicalization)** (XMLC14N) - Used for XML where the context doesn't change.

  Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the *Inclusive Canonicalization* will copy them and the signature will be invalid.

- **Exclusive XML Canonicalization** (EXCC14N) - Designed for *canonicalization* where the context might change.

  Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

The *canonicalization (on page 3418)* method can specify whether or not comments should be included in the *canonical* form output by the *XML canonicalization* method. If a *canonical* form contains comments corresponding to the comment nodes in the input node-set, the result is called *canonical* XML with comments. In an uncommented *canonical* form, comments are removed, including the delimiter for comments outside the document element.

The three operations. **Canonicalize** *(on page 893)*, **Sign** *(on page 895)*, and **Verify Signature** *(on page 898)*, are available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

Signing Files *(on page 895)*

Verifying Signature *(on page 898)*
Example of How to Digitally Sign XML Files or Content *(on page 898)*

Certificates

A certificate is a digitally signed statement from the issuer (an individual, an organization, a website or a firm), saying that the public key (and some other information) of some other entity has a particular value. When data is digitally signed, the signature can be verified to check the data integrity and authenticity. Integrity means that the data has not been modified. Authenticity means the data comes indeed from the entity that claims to have created and signed it. Certificates are kept in special repositories called *keystores (on page 3421)*.

All *keystore* entries (key and trusted certificate entries) are accessed via unique aliases. An alias must be assigned for every new entry of either a key or certificate as a reference for that entity. No *keystore* can store an entity if its alias already exists in that *keystore* and cannot store trusted certificates generated with keys in its *keystore*.

Oxygen XML Editor provides two types of *keystores*: Java Key Store (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A *keystore* file is protected by a password. In a PKCS 12 *keystore* you should not store a certificate without alias together with other certificates, with or without alias, as in such a case the certificate without alias cannot be extracted from the *keystore*.

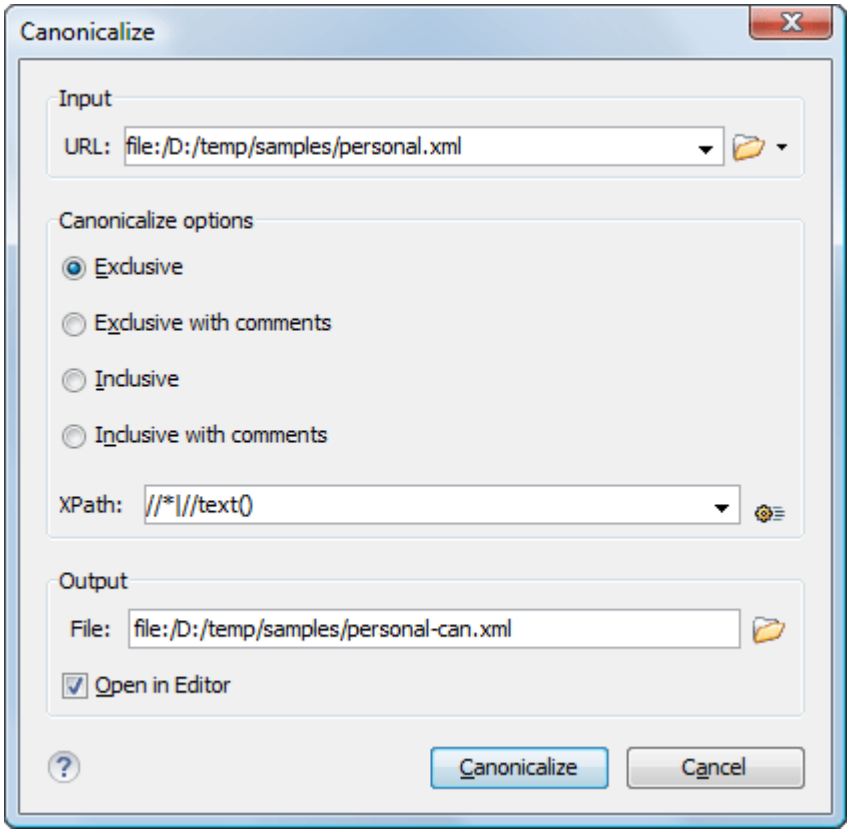
To configure the options for a certificate or to validate it, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XML Signing Certificates**. This opens the certificates preferences page *(on page 276)*.

Related Information:
Digital Signatures Overview *(on page 890)*

Canonicalizing Files

You can select the *canonicalization (on page 3418)* algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

Figure 256. Canonicalization Settings Dialog Box



The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) *canonicalization (on page 3418)* method is used.

> **Note:**
> *Exclusive Canonicalization* just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments *canonicalization (on page 3418)* method is used.
- **Inclusive** - If selected, the inclusive (uncommented) *canonicalization (on page 3418)* method is used.

> **Note:**
> *Inclusive Canonicalization* copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive *Canonicalization* is useful when it is less likely that the signed data will be inserted

in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive *Canonicalization* will copy them and the signature will be invalid.

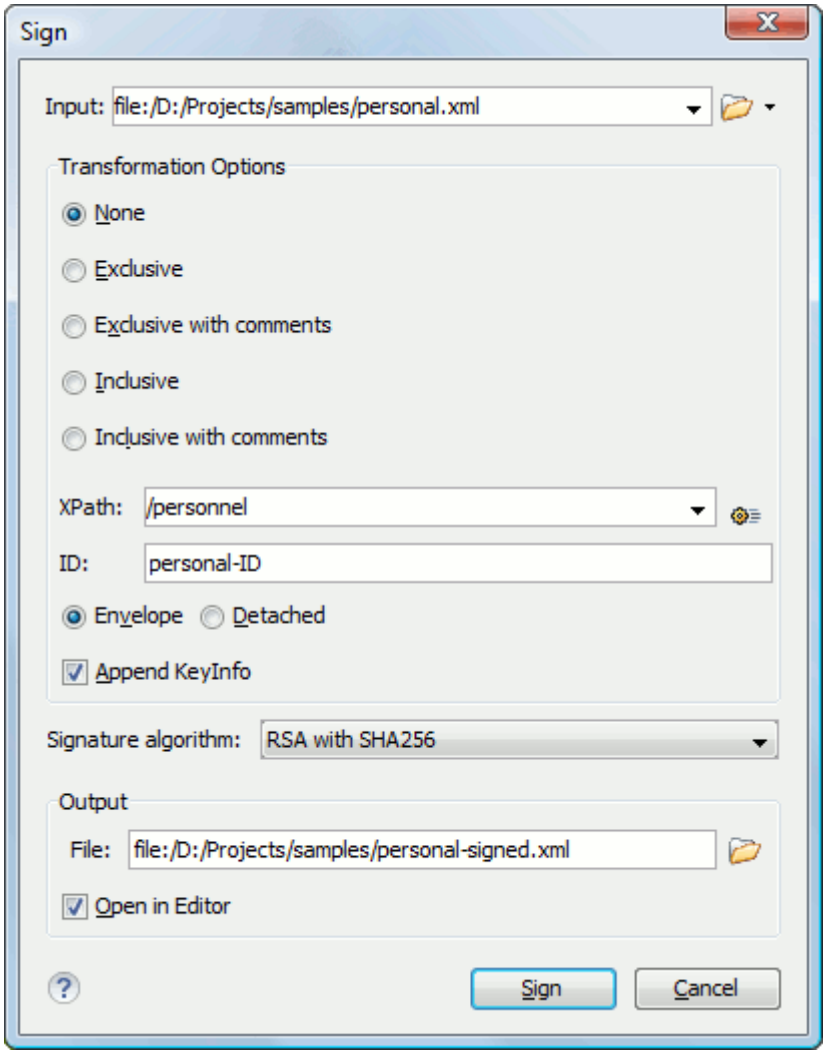
- **Inclusive with comments** - If selected, the inclusive with comments *canonicalization (on page 3418)* method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in the editor.

Related Information:
Digital Signatures Overview *(on page 890)*

Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

Figure 257. Signature Settings Dialog Box



The following options are available:

Note:
If Oxygen XML Editor could not find a valid certificate, a link is provided at the top of the dialog box that opens the XML Signing Certificates preferences page *(on page 276)* where you can configure a valid certificate.

- **Input** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the location of the input URL.
- **Transformation Options** - See the Digital Signature Overview *(on page 890)* section for more information about these options.

- **None** - If selected, no *canonicalization (on page 3418)* algorithm is used.
- **Exclusive** - If selected, the exclusive (uncommented) *canonicalization (on page 3418)* method is used.

> **Note:**
> *Exclusive Canonicalization* just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments *canonicalization (on page 3418)* method is used.
- **Inclusive** - If selected, the inclusive (uncommented) *canonicalization (on page 3418)* method is used.

> **Note:**
> *Inclusive Canonicalization* copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive *Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive *Canonicalization* will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments *canonicalization (on page 3418)* method is used.

- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the *enveloped* signature is used. See the Digital Signature Overview *(on page 890)* for more information.
- **Detached** - If selected, the *detached* signature is used. See the Digital Signature Overview *(on page 890)* for more information.
- **Append KeyInfo** - If this option is selected, the `<ds:KeyInfo>` element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: **RSA with SHA1**, **RSA with SHA256**, **RSA with SHA384**, and **RSA with SHA512**.
- **Output** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in Oxygen XML Editor.

Related Information:
Digital Signatures Overview *(on page 890)*
Verifying Signature *(on page 898)*
Example of How to Digitally Sign XML Files or Content *(on page 898)*

Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

Related Information:
Digital Signatures Overview *(on page 890)*
Signing Files *(on page 895)*
Example of How to Digitally Sign XML Files or Content *(on page 898)*

Example of How to Digitally Sign XML Files or Content

Suppose you want to digitally sign an XML document, but more specifically, suppose you have multiple instances of the same element in the document and you just want to sign a specific ID. Oxygen XML Editor includes a signature tool that allows you to digitally sign XML documents or specific content.

The Oxygen XML Editor installation directory includes a `samples` folder that contains a file called `personal.xml`. For the purposes of this example, this file will be used to demonstrate how to digitally sign specific content. Notice that this file has multiple `<person>` elements inside the `<personnel>` element. Suppose you want to digitally sign the specific `<person>` element that contains the `id=robert.taylor`. To do this, follow this procedure:

1. Open the `personal.xml` file in Oxygen XML Editor in **Text** editing mode.
2. Right-click anywhere in the editor and select the **Sign** action from the **Source** submenu.
   The **Sign** dialog box is displayed.

   > **Tip:**
   > If you want to sign a file but create a new output file so that the original file remains unchanged, use the **Sign** action from the **Tools** menu. Selecting the action from this menu will allow you to choose an input file and output file in the **Sign** dialog box.

3. If Oxygen XML Editor cannot find a valid certificate, click the link at the top of the dialog box to **configure a valid certificate**. This opens the **XML Signing Certificates** preferences page *(on page 276)* that allows you to configure and validate a certificate.
4. Once a valid certificate is recognized, continue to configure the **Sign** dialog box.

a. Select one of the **Transformation Options** *(on page 896)*. For the purposes of this example, select the **Inclusive with comments** option.
b. Specify the appropriate **XPath** expression for the specific element that needs to be signed. For this example, type `/personnel/person` in the **XPath** text box.
c. Enter the specific **ID** that needs to be signed. For this example, type `robert.taylor` in the **ID** field.
d. Select the **Envelope** option *(on page 897)* and leave the other options as their default values.

The digital signature is added at the end of the XML document, just before the end tag. It is always added at the end of the document, even if you only sign specific content within the document.

5. You can verify the signature by choosing the **Verify Signature** action from the **Source** submenu of the contextual menu.

Verifying Signature *(on page 898)*

Editing XSLT Stylesheets

Oxygen XML Editor includes a built-in editor for XSLT stylesheets. This section presents the features of the XSLT editor and how these features can be used. The features of the XSLT editor include:

- **Create new XSLT files and templates** - You can use the built-in new file wizards to create new XSLT documents or templates *(on page 377)*.
- **Open and Edit XSLT files** - XSLT files can be opened and edited in the source editor (**Text** mode *(on page 527)*).
- **Visual Editing** - XSLT stylesheets are rendered, and can be edited, in the visual **Author** editing mode *(on page 598)*.
- **Validation** - Presents validation errors in XSLT files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Syntax highlighting** - The syntax highlighting in Oxygen XML Editor makes XSLT files more readable.

Resources

For more information about working with XSLT in Oxygen XML Editor, see the following resources:

- Webinar: **Introduction to XSLT Using Oxygen**.
- Webinar: **XSLT Quick Fixes**.

Modular Contextual XSLT Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex stylesheet cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a function defined in a main stylesheet is not visible when you edit an included or imported module. Oxygen XML Editor provides the

support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger stylesheet structure.

You cat set a main XSLT stylesheet either using the *main files* support from the **Project** view *(on page 428)*, or using a validation scenario.

To set a *main file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main stylesheet. In this case, it considers the current module as the main stylesheet.

The advantages of editing in the context of *main file (on page 3421)* include:

- Correct validation of a module in the context of a larger stylesheet structure.
- *Content Completion Assistant (on page 3418)* displays all components valid in the current context.
- The **Outline** view *(on page 912)* displays the components collected from the entire stylesheet structure.

Resources

For more information about editing XSLT stylesheets in the *main files* context, watch our video demonstration:

https://www.youtube.com/embed/UZwg385RKNw

Related Information:
XSLT Referenced/Dependent Resources View *(on page 919)*
XSLT Component Dependencies View *(on page 922)*

Validating XSLT Stylesheets

Numerous XSLT code quality assurance checks are done during automatic validation to help you keep your stylesheets valid and well-formed. Oxygen XML Editor performs the validation of XSLT documents with the help of an XSLT processor that you can configure in the preferences pages *(on page 254)* according to the XSLT version.

For XSLT 1.0, the options are: Xalan (Deprecated), Saxon 6.5.5 and Saxon 12.3. For XSLT 2.0, the option is: Saxon 12.3. For XSLT 3.0, the option is Saxon 12.3.

To access the XSLT preferences *(on page 254)* quickly, use the **Validation options** action from the **Document > Validate** menu.

Creating a Validation Scenario for XSLT Stylesheets

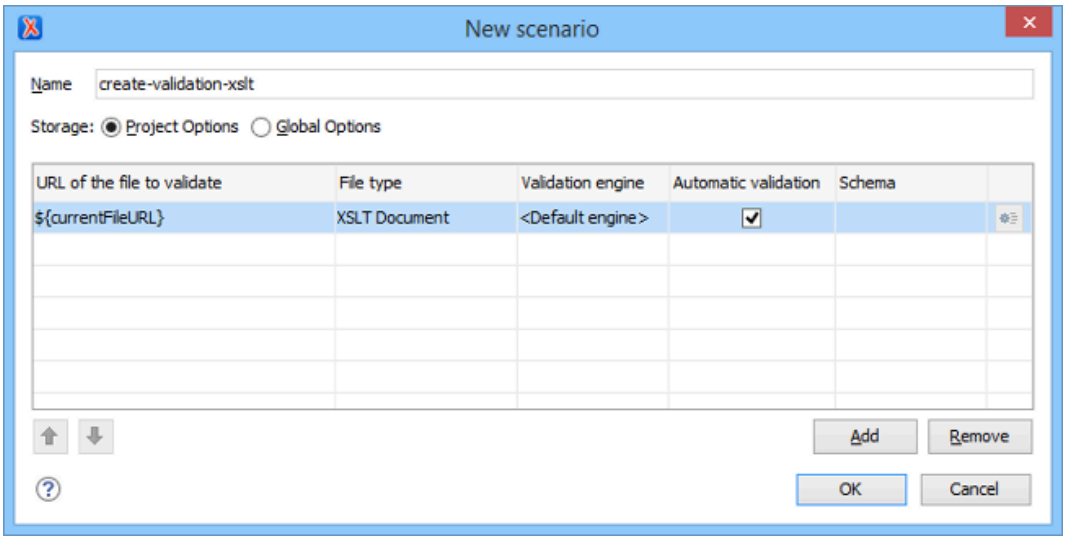
You can validate an XSLT document using the engine defined in the transformation scenario, or a custom validation scenario. If you choose to validate using the engine from transformation scenario, and a transformation scenario is not associated with the current document or the engine has no validation support,

the default engine is used. To set the default engine, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XSLT/FO/XQuery > XSLT**.

You can also create new validation scenarios or edit existing ones, and you can add *JARS (on page 3420)* and classes that contain extension functions. To create or edit a validation scenario for an XSLT stylesheet, follow these steps:

1. With the XSLT file open in Oxygen XML Editor, select the **Configure Validation Scenario(s)** from the **Document > Validate** menu, or the **Validation** toolbar drop-down menu, or from the **Validate** submenu when invoking the contextual menu on the XSLT file in the **Project** view *(on page 413)*.
   The **Configure Validation Scenario(s)** dialog box is displayed. It contains the existing scenarios, organized in categories depending on the type of file they apply to. You can use the options in the **Settings** drop-down menu to filter which scenarios are shown.
2. To edit an existing scenario, select the scenario and click the **Edit** button. If you try to edit one of the *read-only* built-in scenarios, Oxygen XML Editor creates a customizable duplicate (you can also use the **Duplicate** button).
3. To add a new scenario, click the **New** button.
   The **New scenarios** dialog box is displayed. It lists all validation units of the scenario.

Figure 258. Add / Edit a Validation Unit



4. Configure the following information in this dialog box:
   a. **Name** - The name of the validation scenario.
   b. **Storage** - You can choose between storing the scenario in the **Project Options** *(on page 3423)* or **Global Options** *(on page 3420)*.
   c. **URL of the file to validate** - In most cases, leave this field as the default selection (the URL of the current file). If you want to specify a different URL, double-click its cell and enter the URL in the text field, select it from the drop-down list, or use the **Browse** drop-down menu or **Insert Editor Variable** *(on page 332)* button.
   d. **File type** - The file type should be **XSLT Document**.

e. **Validation engine** - Click the cell to select a validation engine. You must select an engine to be able to add or edit extensions.
f. **Automatic validation** - If this option is selected, the validation operation defined by this row is also used by the automatic validation feature *(on page 786)*.

5. To add or edit extensions, click the **Edit extensions** button. This button is only available if the **File type** is set as **XSLT Document** and a **Validation engine** is chosen.
   The **Libraries** dialog box is opened. It is used to specify the *JARS* and classes that contain extension functions called from the XSLT file of the current validation scenario. They will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item and click the **Move up** or **Move down** buttons.
6. Click **OK** to close the **New scenario** dialog box.
   The newly created validation scenario is now included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current XSLT document and click the **Apply associated** button to run the validation scenario.

Validating XSLT Stylesheets with Custom Engines

If you need to validate an XSLT stylesheet with a validation engine that is different from the built-in engine, you can configure external engines as custom XSLT validation engines in the Oxygen XML Editor preferences. After a custom validation engine is properly configured *(on page 236)*, it can be applied on the current document by selecting it from the list of custom validation engines in the **Validation** toolbar drop-down menu. The document is validated against the schema declared in the document.

By default, there are two validators that are configured for XSLT stylesheets:

- **MSXML 4.0 (Deprecated)** - included in Oxygen XML Editor (Windows edition). It is associated to the XSL Editor type in Preferences page. *(on page 236)*
- **MSXML.NET (Deprecated)** - included in Oxygen XML Editor (Windows edition). It is associated to the XSL Editor type in Preferences page. *(on page 236)*

Validating XSLT Stylesheets that Call Java Extensions

It is possible to validate an XSLT that calls Java extensions. This is achieved through a transformation scenario where the Java extensions are specified, and the default validation will be processed using the parameters defined in the transformation scenario.

To validate XSLT with Java extensions, follow this procedure:

1. Create an XSLT transformation on XML scenario *(on page 1556)* for your XSLT document (select **Configure Transformation Scenario(s)** action from the toolbar, then click **New**, and select **XSLT transformation on XML**).
2. In the **New scenario** dialog box, click the **Extensions** button (in the **XSLT** tab), specify the Java extensions (JAR libraries) that are needed, and click **OK**.

3. Once you are finished configuring the transformation scenario, click **OK**, then select **Save and close**.
4. Use the **Validate** button on the toolbar and the default validation will detect and use the transformation scenario profile you just configured and saved.

Debugging XSLT that Call Java Extensions *(on page 2246)*

XSLT Quick Fix Support

The Oxygen XML Editor *Quick Fix* support *(on page 3423)* helps you resolve various errors that appear in a stylesheet by proposing *Quick Fixes* to problems such as missing templates, misspelled template names, missing functions, or references to an undeclared variable or parameter.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a *Quick Fix* is available for that particular error or warning, you can access the *Quick Fix* proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip pop-up window.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon ( ) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor displays the list of available fixes.
- With the cursor placed in the highlighted area of the error or warning, you can also invoke the *Quick Fix* menu by pressing **Alt + 1 (Command + Option + 1 on macOS)** on your keyboard.

Note:
The *Quick Fixes* are available only when validating an XSLT file with Saxon HE/PE/EE.

Figure 259. Example of an Undefined XSLT Functions Quick Fix

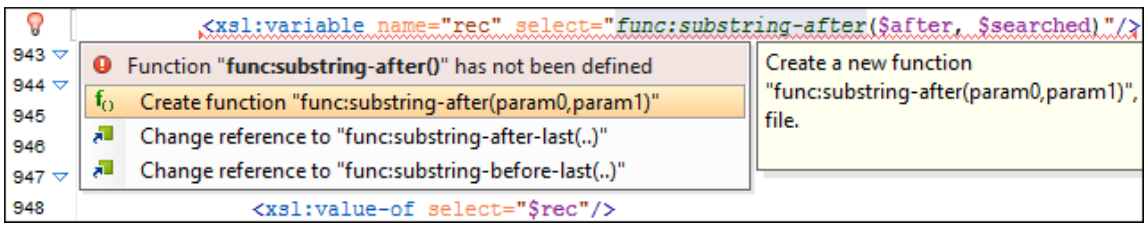

Figure 260. Example of an Undeclared XSLT Variables/Parameters Quick Fix

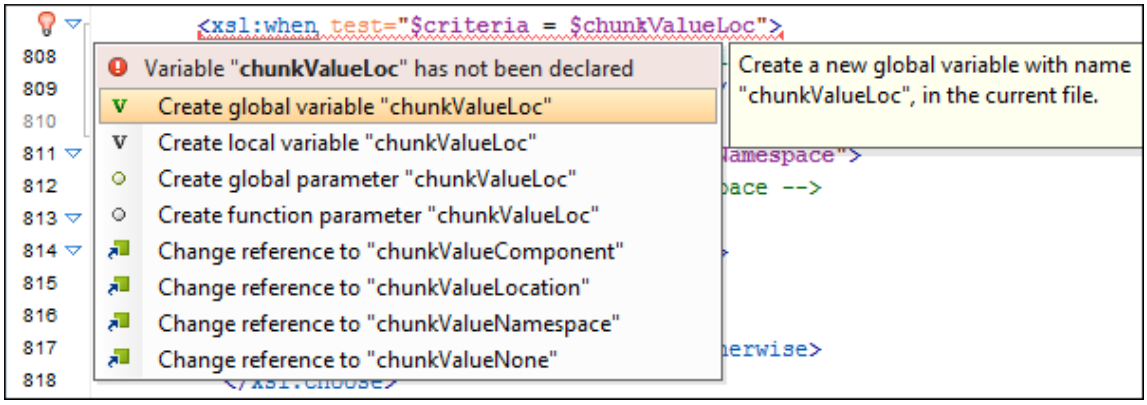


Oxygen XML Editor provides XSLT *Quick Fixes* for the following types of instances:

- **Template does not exist**, when the template name referenced in a `<call-template>` element does not exist. The following fixes are available:
  - **Create template "templateName"** - creates a template and generates its corresponding parameters. The template name and parameter names and types are collected from the `<call-template>` element.
  - **Change reference to "newTemplateName"** - changes the name of the missing template referenced in the `<call-template>` element. The proposed new names are the existing templates with names similar with the missing one.
- **Variable/Parameter not declared**, when a parameter or variable reference cannot be found. The following fixes are available:
  - **Create global variable "varName"** - creates a global variable with the specified name in the current stylesheet. The new variable is added at the beginning of the stylesheet after the last global variable or parameter declaration.
  - **Create global parameter "paramName"** - creates a global parameter with the specified name in the current stylesheet. The new parameter is added at the beginning of the stylesheet after the last global parameter or variable declaration.
  - **Create local variable "varName"** - creates a local variable with the specified name before the current element.
  - **Create template parameter "paramName"** - creates a new parameter with the specified name in the current template. This fix is available if the error is located inside a template.
  - **Create function parameter "paramName"** - creates a new parameter with the specified name in the current function. This fix is available if the error is located inside a function.
  - **Change reference to "varName"** - changes the name of the referenced variable/parameter to an existing local or global variable/parameter, that has a similar name with the current one.
- **Parameter from a called template is not declared**, when a parameter referenced from a `<call-template>` element is not declared. The following fixes are available:

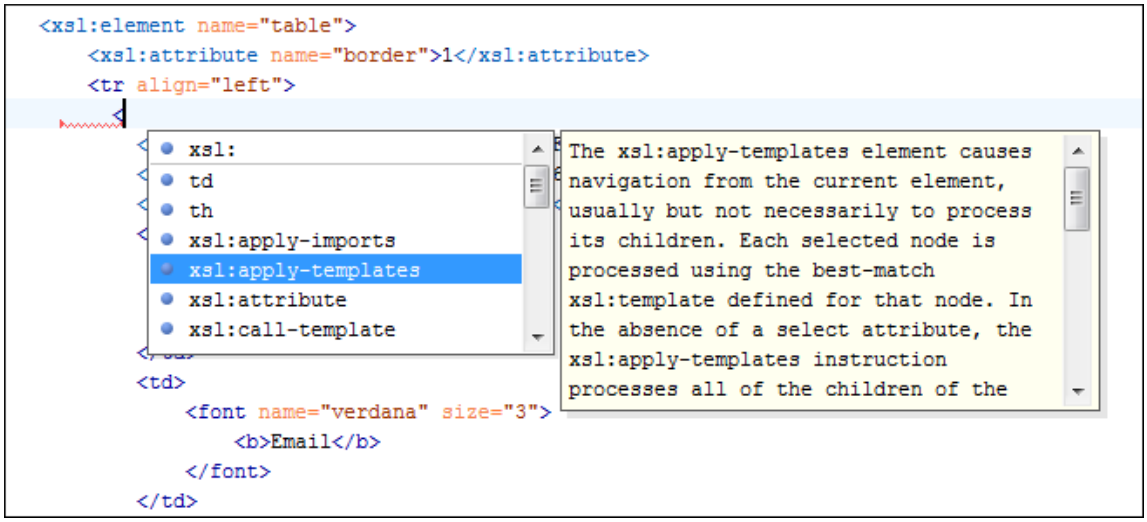
    - **Create parameter "paramName" in the template "templateName"** - creates a new parameter with the specified name in the referenced template.
    - **Change "paramName" parameter reference to "newParamName"** - changes the parameter reference from the `<call-template>` element to a parameter that is declared in the called template.
    - **Remove parameter "paramName" from call-template** - removes the parameter with the specified name from the `<call-template>` element.
- **No value supplied for required parameter**, when a required parameter from a template is not referenced in a `<call-template>` element. The **Add parameter "paramName" in call-template** quick-fix is available. It creates a new parameter with the specified name in call-template element.
- **Function "prefix:functionName()" has not been defined**, when a function declaration is not found. The following *Quick Fixes* are available:
    - **Create function "prefix:functionName(param1, param2)"** - creates a new function with the specified signature, after the current top-level element from stylesheet.
    - **Change function to "newFunctionName(..)"** - changes the referenced function name to an already defined function. The proposed names are collected from functions with similar names and the same number of parameters.
- **Attribute-set "attrSetName" does not exist**, when the referenced attribute set does not exist. The following *Quick Fixes* are available:
    - **Create attribute-set "attrSetName"** - creates a new attribute set with the specified name, after the current top-level element from stylesheet.
    - **Change reference to "attrSetName"** - changes the referenced attribute set to an already defined one.
- **Character-map "chacterMap" has not been defined**, when the referenced character map declaration is not found. The following *Quick Fixes* are available:
    - **Create character-map "characterMapName"** - creates a new character map with the specified name, after the current top-level element from stylesheet.
    - **Change reference to "characterMapName"** - changes the referenced character map to an already defined one.

Content Completion in XSLT Stylesheets

The list of proposals offered by the *Content Completion Assistant (on page 3418)* in XSLT are context-sensitive and includes proposals that are valid at the current cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

You can enhance the list of proposals by specifying an additional schema. This schema is defined in the **Content Completion / XSLT** preferences *(on page 221)* page and can be any of the following: XML Schema, DTD, RELAX NG schema, or NVDL schema.

Figure 261. XSLT Content Completion Assistant



The feature is activated in **Text** mode in the following situations:

- After you enter the **<** character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the **Activation delay of the proposals window (ms)** option *(on page 221)* from the **Content Completion** preferences page.
- After typing a partial element or attribute name, you can manually activate it by pressing **Ctrl + Space** or **Alt + ForwardSlash (Command + Option + ForwardSlash on macOS)**. If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

The *Content Completion Assistant* proposes numerous item types (such as templates, variables, parameters, keys, etc.) that are defined in the current stylesheet, and in the imported and included XSLT stylesheets. The *Content Completion Assistant* also includes code templates that can be used to quickly insert code fragments *(on page 546)* into stylesheets.

Note:
For XSL and XSD resources, the *Content Completion Assistant* collects its components starting from the *main files (on page 3421)*. The *main files* can be defined in the project or in the associated validation scenario. For further details about the *Main Files* support go to Defining Main Files at Project Level *(on page 428)*.

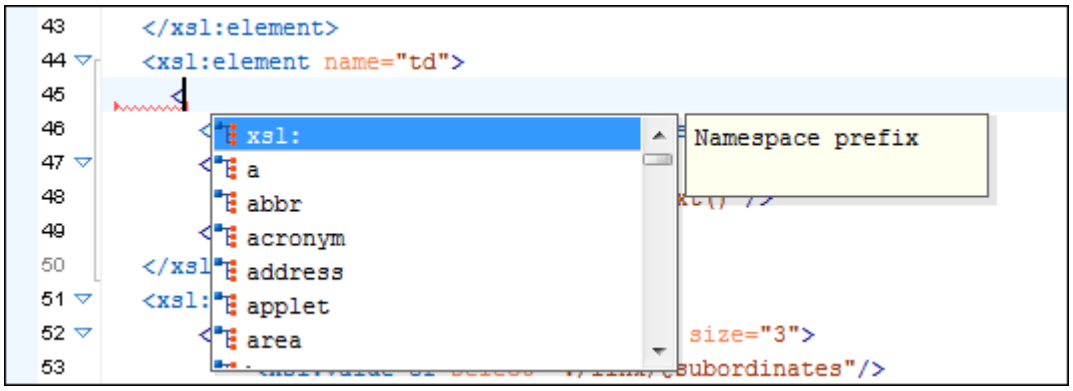
The extension functions included in the Saxon 6.5.5 and 12.3 transformation engines are presented in the content completion list only if the Saxon namespace (*http://saxon.sf.net* for XSLT version 2.0 / 3.0 or *http://icl.com/saxon* for XSLT version 1.0) is declared and one of the following conditions is true:

- The edited file has a transformation scenario that uses as transformation engine Saxon 6.5.5 (for XSLT version 1.0), Saxon 12.3 PE or Saxon 12.3 EE (for XSLT version 2.0 / 3.0).
- The edited file has a validation scenario that uses as validation engine Saxon 6.5.5 (for version 1.0), Saxon 12.3 PE or Saxon 12.3 EE (for version 2.0 / 3.0).
- The validation engine specified in Options *(on page 254)* page is Saxon 6.5.5 (for version 1.0), Saxon 12.3 PE or Saxon 12.3 EE (for version 2.0 / 3.0).

Additionally. the Saxon-CE-specific extension functions and instructions are presented in the list of content completion assistance proposals only if the `http://saxonica.com/ns/interactiveXSLT` namespace is declared.

Namespace prefixes in the scope of the current context are presented at the top of the content completion assistance window to speed up the insertion into the document of prefixed elements.

Figure 262. Namespace Prefixes in the Content Completion Assistant



For the common namespaces such as XSL namespace (`http://www.w3.org/1999/XSL/Transform`), XML Schema namespace (`http://www.w3.org/2001/XMLSchema`), or Saxon namespace (`http://icl.com/saxon` for version 1.0, `http://saxon.sf.net/` for version 2.0 / 3.0), Oxygen XML Editor provides an easy mode to declare them by proposing a prefix for these namespaces.

Note:
For XSLT documents that are unversioned or have an unsupported version, the content completion in Oxygen XML Editor uses version 3.0 as the fallback.

Content Completion in XPath Expressions

In XSLT stylesheets, the *Content Completion Assistant (on page 3418)* provides all the features available in the XML editor *(on page 542)* and also adds some enhancements. In XPath expressions used in attributes of XSLT stylesheets (such as `@match`, `@select`, and `@test`), the *Content Completion Assistant* offers the names of XPath and XSLT functions, XSLT axes, and user-defined functions (the name of the function and its parameters). If a transformation scenario was defined and associated to the edited stylesheet, the *Content Completion Assistant* computes and presents elements and attributes based on:

- The input XML document selected in the scenario.
- The current context in the stylesheet.

The associated document is displayed in the **XSLT/XQuery Input** view *(on page 917)*.

Content completion for XPath expressions is started:

- On XPath operators detected in one of the `@match`, `@select`, and `@test` attributes of XSLT elements: `"`, `'`, `/`, `//`, `(`, `[`, `|`, `:`, `::`, `$`
- For attribute value templates of non-XSLT elements, that is the `{` character when detected as the first character of the attribute value.
- On request, if the combination **Ctrl + Space** is pressed inside an edited XPath expression.

The proposals presented in the *Content Completion Assistant* are dependent on:

- The context of the current XSLT element.
- The XML document associated with the edited stylesheet in the stylesheet transformation scenario.
- The XSLT version of the stylesheet (1.0, 2.0, or 3.0).

> **Note:**
> The XSLT 3.0 content completion list of proposals includes specific elements and attributes for the 3.0 version.

For example, if the document associated with the edited stylesheet is:

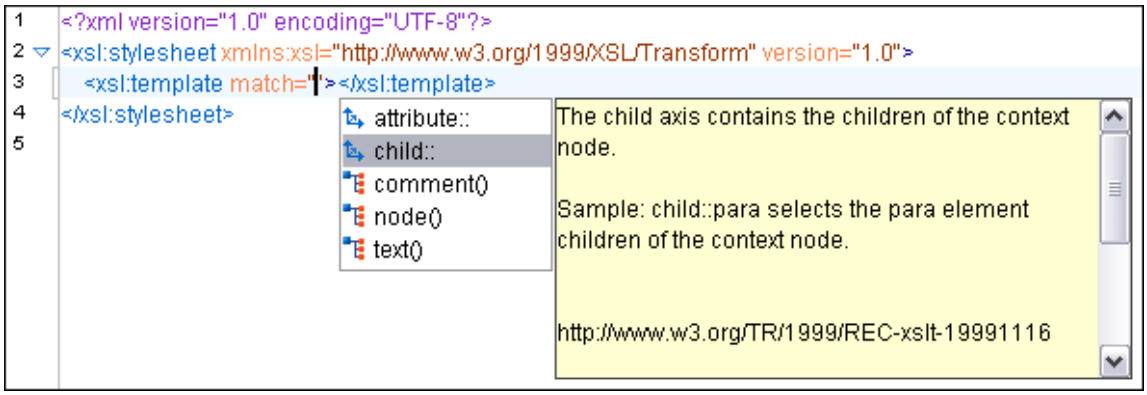
```
<personnel>
    <person id="Big.Boss">
        <name>
            <family>Boss</family>
            <given>Big</given>
        </name>
        <email>chief@oxygenxml.com</email>
        <link subordinates="one.worker"/>
    </person>
    <person id="one.worker">
        <name>
            <family>Worker</family>
            <given>One</given>
        </name>
        <email>one@oxygenxml.com</email>
        <link manager="Big.Boss"/>
    </person>
</personnel>
```

If you enter an `<xsl:template>` element using the *Content Completion Assistant*, the following actions are triggered:

- The `@match` attribute is inserted automatically.
- The cursor is placed between the quotes.
- The XPath *Content Completion Assistant* automatically displays a pop-up window with all the XSLT axes, XPath functions and elements and attributes from the XML input document that can be inserted in the current context.

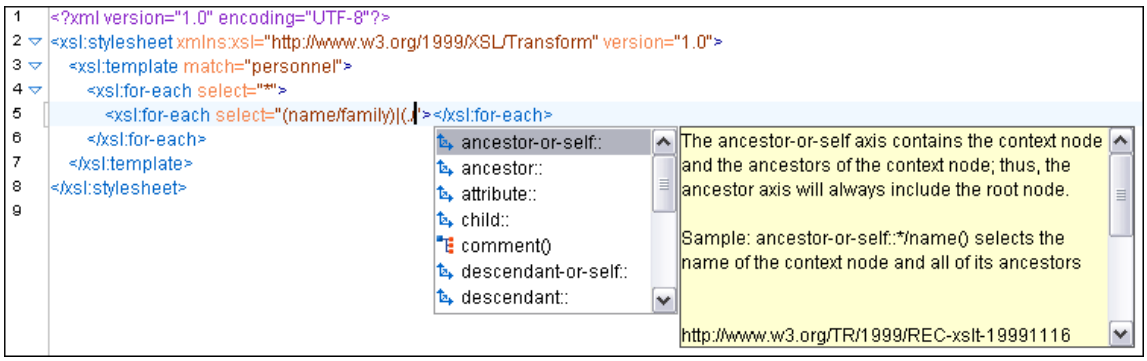
The set of XPath functions depends on the XSLT version declared in the root element `xsl:stylesheet`: 1.0, 2.0, or 3.0. Functions from other namespaces, such as maps, arrays, and math, are presented only if the namespaces are declared.

Figure 263. Content Completion in the `@match` Attribute



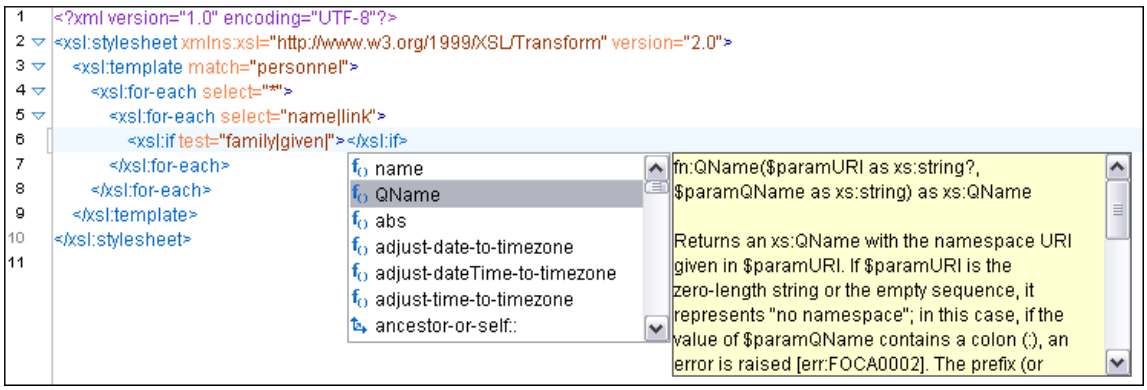
If the cursor is inside the `@select` attribute of an `<xsl:for-each>`, `<xsl:apply-templates>`, `<xsl:value-of>` or `<xsl:copy-of>` element the content completion proposals depend on the path obtained by concatenating the XPath expressions of the parent XSLT elements `<xsl:template>` and `<xsl:for-each>` as shown in the following figure:

Figure 264. Content Completion in the `@select` Attribute



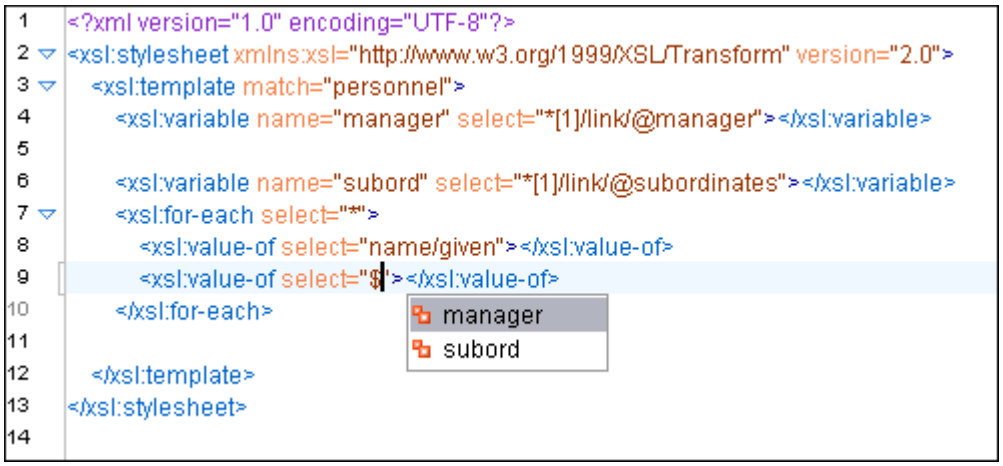
Also XPath expressions typed in the `@test` attribute of an `<xsl:if>` or `<xsl:when>` element benefit of the assistance of the content completion.

Figure 265. Content Completion in the `@test` Attribute



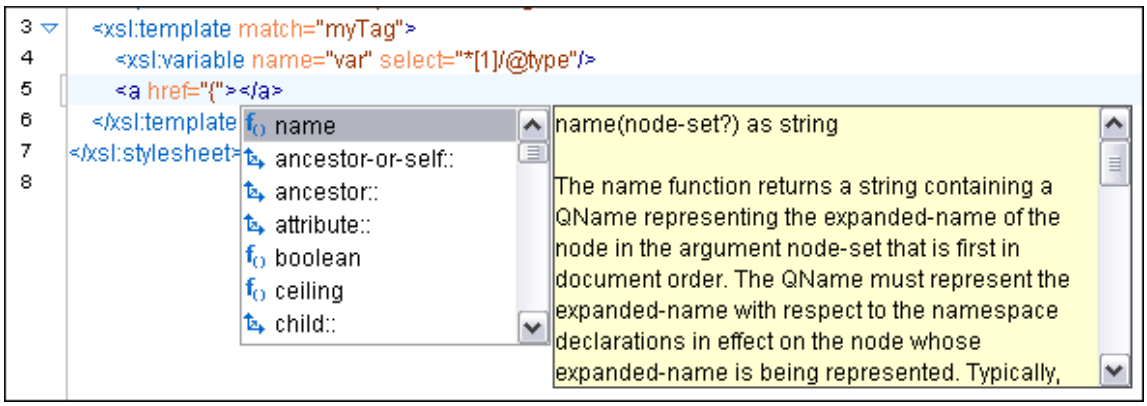
XSLT variable references are easier to insert in XPath expressions with the help of the content completion pop-up triggered by the `$` character, which signals the start of such a reference in an XPath expression.

Figure 266. Content Completion in the `@test` Attribute



If the `{` character is the first one in the value of the attribute, the same *Content Completion Assistant* is available also in attribute value templates of non-XSLT elements.

Figure 267. Content Completion in Attribute Value Templates



The time delay (configured in the **Content Completion** preferences page *(on page 221)*) is also applied for the content completion in XPath expressions.

Related Information:

Working with XPath Expressions *(on page 2117)*

Tooltip Helper for the XPath Functions Arguments

When editing the arguments of an XPath/XSLT function, Oxygen XML Editor tracks the current entered argument by displaying a tooltip containing the function signature. The currently edited argument is highlighted with a bolder font.

When moving the cursor through the expression, the tooltip is updated to reflect the argument found at the cursor position.

Examples:

If you want to concatenate the absolute values of two variables, named *v1* and *v2*:

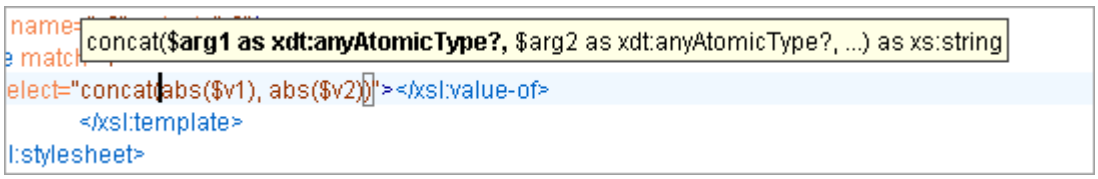
```
<xsl:template match="/">
    <xsl:value-of select="concat(abs($v1), abs($v2))"></xsl:value-of>
</xsl:template>
```

When moving the cursor before the first `abs` function, Oxygen XML Editor identifies it as the first argument of the `concat` function. The tooltip shows in bold font the following information about the first argument:

- Its name is `$arg1`.
- Its type is `xdt:anyAtomicType`.
- It is optional (note the `?` sign after the argument type).

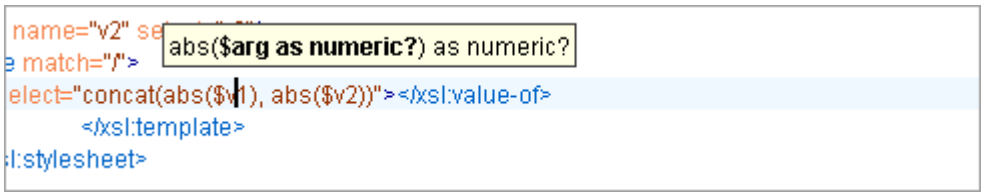
The function also takes other arguments that have the same type and returns a `xs:string`.

Figure 268. XPath Tooltip Helper - Identify the `concat` Function's First Argument



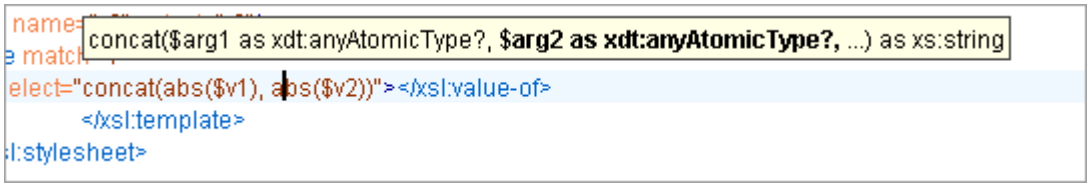
Moving the cursor on the first variable `$v1`, the editor identifies the `abs` as context function and shows its signature:

Figure 269. XPath Tooltip Helper - Identify the `abs` Function's Argument



Further, clicking the second `abs` function name, the editor detects that it represents the second argument of the `concat` function. The tooltip is repainted to display the second argument in bold font.

Figure 270. XPath Tooltip Helper - Identify the `concat` Function's Second Argument



Note:
The tooltip helper is also available in the **XPath Builder** view *(on page 2120)* and XPath toolbar *(on page 2118)*.

Related Information:
Working with XPath Expressions *(on page 2117)*

Syntax Highlighting in XSLT

Oxygen XML Editor supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XSLT files, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*.
2. Go to **Editor > Syntax Highlight** *(on page 233)*.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XSL** tab in the **Preview** pane to see the effects of your changes.

Tip:
Oxygen XML Editor also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page *(on page 234)*.

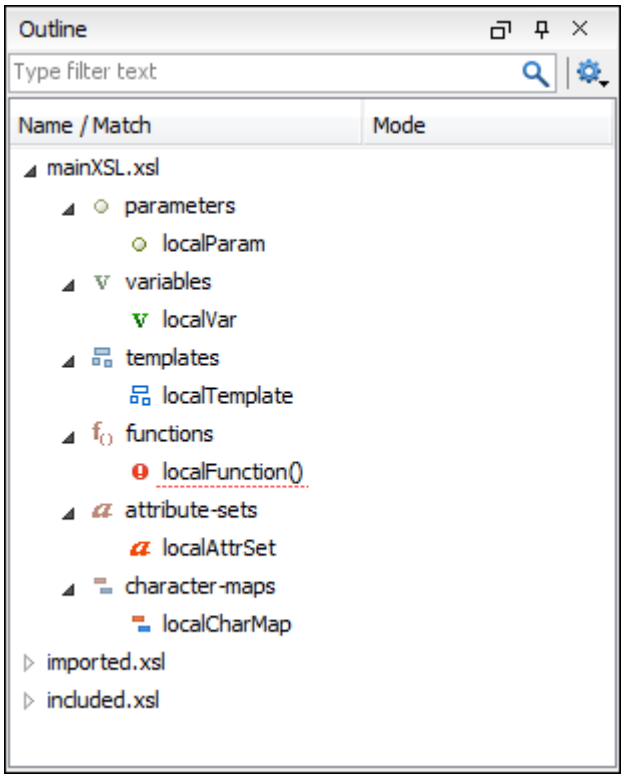
Related Information:
Customize Syntax Highlight colors *(on page 233)*

XSLT Outline View

The **Outline** view for XSLT stylesheets displays the list of all the components (templates, attribute-sets, character-maps, variables, functions, keys, outputs) from both the edited stylesheet and its imports or includes. For XSL and XSD resources, the **Outline** view collects its components starting from the *main files (on page 3421)*. The main files can be defined in the project or in the associated validation scenario. For further details about the *Main Files* support go to Defining Main Files at Project Level *(on page 428)*.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 271. XSLT Outline View



The following actions are available in the **Settings** menu on the **Outline** view toolbar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches;

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the XSLT editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

When the **Show components** option is selected, the following actions are available:

Show XML structure

Displays the XML document structure in a tree-like structure.

Show all components

Displays all components that were collected starting from the *main file (on page 3421)*. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/type

The stylesheet components can be grouped by location and type.

When the **Show XML structure** option is selected, the following actions are available:

Show components

Switches the **Outline** view to the components display mode.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel *(on page 315)*.

Configure displayed attributes

Displays the **XML Structured Outline** preferences page *(on page 315)*.

The following contextual menu actions are also available when the **Show components** option is selected in the **Settings** menu:

Edit Attributes

Opens a small in-place editor that allows you to edit the attributes of the selected node.

Cut

Cuts the currently selected node.

Copy

Copies the currently selected node.

Delete

Deletes the currently selected node.

Search References Ctrl + Shift + R (Command + Shift + R on macOS)

Searches all references of the item found at current cursor position in the defined scope, if any.
See Finding XSLT References and Declarations *(on page 924)* for more details.

Search References in

Searches all references of the item found at current cursor position in the specified scope. See Finding XSLT References and Declarations *(on page 924)* for more details.

Component Dependencies

Opens the **Component Dependencies** view *(on page 922)* that allows you to see the dependencies for the currently selected component.

Show referenced resources

Opens the **Referenced/Dependent Resources** view *(on page 919)* that displays the references for the currently selected resource.

Show dependent resources

Opens the **Referenced/Dependent Resources** view *(on page 919)* that displays the dependencies of the currently selected resource.

Rename Component in

Renames the selected component. See XSLT Refactoring Actions *(on page 928)* for more details.

The following contextual menu actions are available in the **Outline** view when the **Show XML structure** option is selected in the **Settings** menu:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a small in-place editor that allows you to edit the attributes of the selected node.

Toggle Comment

Comments/uncomments the currently selected element.

Search references

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Opens the **Component Dependencies** view *(on page 922)* that displays the dependencies of the currently selected component.

Rename Component in

Renames the currently selected component in the context of a scope that you define.

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Delete

Deletes the currently selected component.

Expand More

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

The stylesheet components information is presented on two columns: the first column presents the `@name` and `@match` attributes, the second column the `@mode` attribute. If you know the component name, match or mode, you can search it in the **Outline** view by typing one of these pieces of information in the filter text field from the top of the view or directly on the tree structure. When you type de component name, match or mode in the text field, you can switch to the tree structure using:

- Keyboard arrow keys
- **Enter** key
- **Tab** key
- **Shift-Tab** key combination

To switch from tree structure to the filter text field, you can use **Tab** and **Shift-Tab**.

Tip:
The search filter is case insensitive. The following wildcards are accepted:

- ***** - any string
- **?** - any character
- **,** - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

Oxygen XML Editor allows you to sort the components of the tree in the **Outline** view.

Note:
Sorting groups in the **Outline** view is not supported.

Oxygen XML Editor has a predefined order of the groups in the **Outline** view:

- For location, the names of the files are sorted alphabetically. The file you are editing is located at the top of the list.
- For type, the order is: parameters, variables, templates, functions, set attributes, character-map.

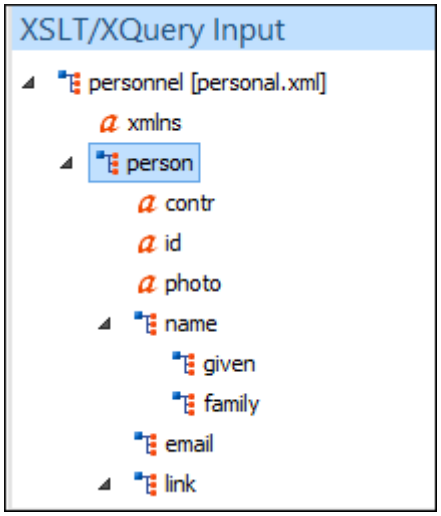
Note:
When no grouping is available and the table is not sorted, Oxygen XML Editor sorts the components depending on their order in the document. Oxygen XML Editor also takes into account the name of the file that the components are part of.

XSLT Input View

The structure of the XML document associated to the edited XSLT stylesheet is displayed in a tree form in a view called the **XSLT Input** view. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. The tree nodes represent the elements of the documents.

If you click a node in the **XSLT Input** view, the corresponding template from the stylesheet is highlighted. A node can be dragged from this view and dropped in the editor area for quickly inserting `<xsl:template>`, `<xsl:for-each>`, or other XSLT elements that have the `@match`,`@select`, or `@test` attribute already completed. The value of the attribute is the correct XPath expression that refers to the dragged tree node. This value is based on the current editing context of the drop spot.

Figure 272. XSLT Input View



Example:

For the following XML document:

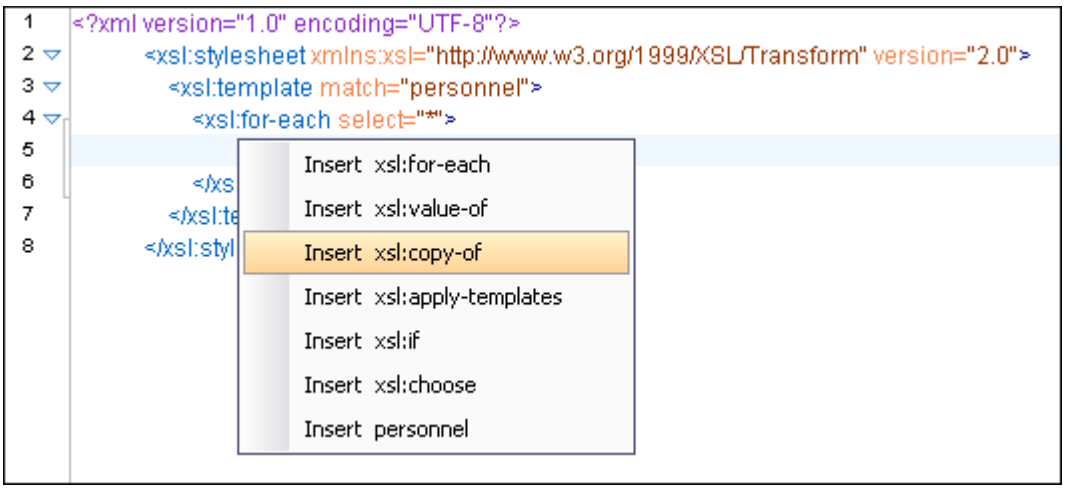
```
<personnel>
    <person id="Big.Boss">
        <name>
            <family>Boss</family>
            <given>Big</given>
        </name>
        <email>chief@oxygenxml.com</email>
        <link subordinates="one.worker"/>
    </person>
    <person id="one.worker">
        <name>
            <family>Worker</family>
            <given>One</given>
        </name>
        <email>one@oxygenxml.com</email>
        <link manager="Big.Boss"/>
    </person>
</personnel>
```

and the following XSLT stylesheet:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
        version="2.0">
    <xsl:template match="personnel">
        <xsl:for-each select="*">

        </xsl:for-each>
    </xsl:template>
</xsl:stylesheet>
```

if you drag the `<given>` element and drop it inside the `<xsl:for-each>` element, the following pop-up menu is displayed:



if you select **Insert xsl:copy-of** (for example), the resulting document will look like this:

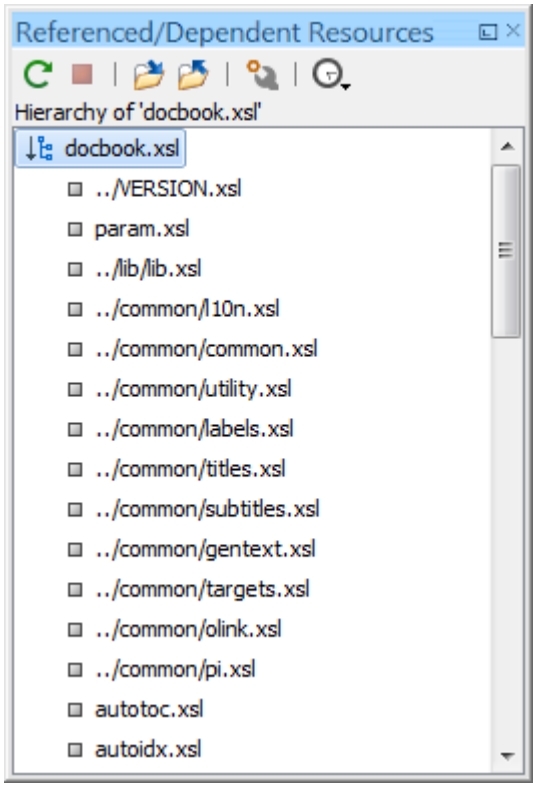
```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0">
    <xsl:template match="personnel">
        <xsl:for-each select="*">
            <xsl:copy-of select="name/given"/>
        </xsl:for-each>
    </xsl:template>
</xsl:stylesheet>
```

XSLT Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for resources included in a stylesheet. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If you want to see the references or dependencies of a stylesheet, select the desired stylesheet in the **Project** view *(on page 413)* and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

Figure 273. Referenced/Dependent Resources View



The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

Refresh

Refreshes the resource structure.

Stop

Stops the computing.

Show hierarchy for

Computes the hierarchical structure of the references for a resource.

Show dependencies for

Computes the structure of the dependencies for a resource.

Configure dependencies search scope

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

 **Add to Main Files**

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

Tip:
When a recursive reference is encountered in the view, the reference is marked with a special icon .

Related Information:

Modular Contextual XML Editing Using 'Main Files' Support *(on page 841)*
Search and Refactor Operations Scope *(on page 843)*

Moving/Renaming XSLT Resources

You can move and rename a resource presented in the **Referenced/Dependent Resources** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

XSLT Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

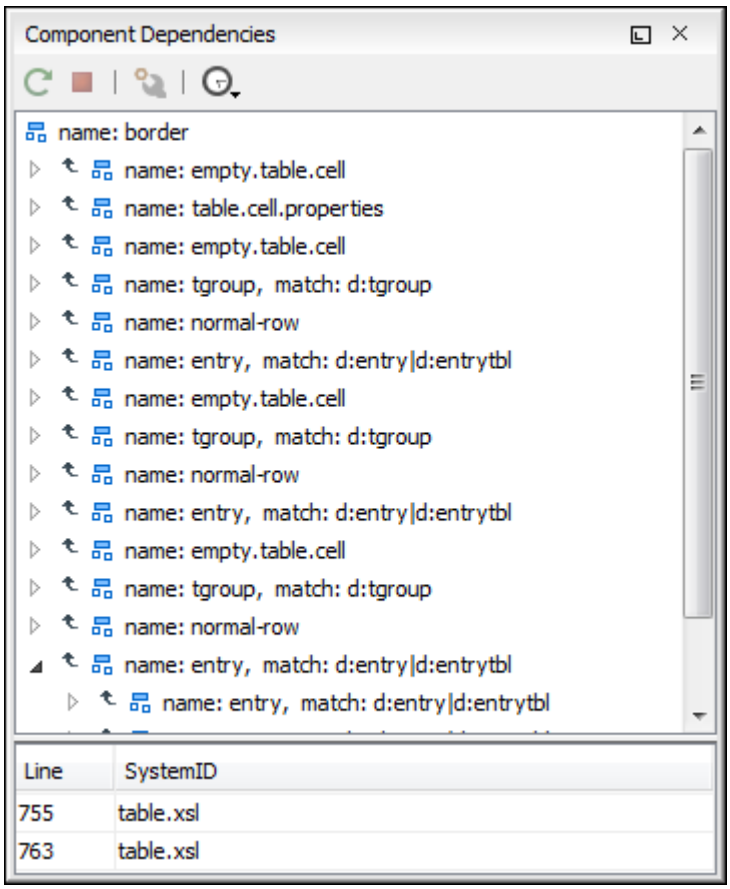
To see the dependencies of an XSLT component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named components (templates, variables, parameters, attribute sets, keys, functions, outputs).

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

Figure 274. Component Dependencies View



The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:
Search and Refactor Operations Scope *(on page 843)*

Highlight Component Occurrences

When a component (for example variable or named template) is found at current cursor position, Oxygen XML Editor performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document.

Note:
Oxygen XML Editor also supports occurrences highlight for template modes.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is enabled by default. To configure it, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Mark Occurrences**. A search can also be triggered with the **Search > Search Occurrences in File (Ctrl + Shift + U (Command + Shift + U on macOS))** contextual menu action. Matches are displayed in separate tabs of the **Results** view *(on page 558)*.

Finding XSLT References and Declarations

The following search actions related with XSLT references and declarations are available from the **Search** submenu of the contextual menu and from the **Document > References** menu:

Search References

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined but the currently edited resource is not part of the range of determined resources, a warning dialog box is displayed that allows you to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when a scope is defined.

Search Declarations

Searches all declarations of the item found at current cursor position in the defined scope, if any. If a scope is defined but the currently edited resource is not part of the range of resources determined by this scope, a warning dialog box is displayed that allows you to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when a scope is defined.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

Go to Definition

Moves the cursor to the location of the definition of the current item.

> **Note:**
> You can also use the **Ctrl + Single-Click (Command + Single-Click on macOS)** shortcut on a reference to display its definition.

Related Information:
Search and Refactor Operations Scope *(on page 843)*

XSLT Stylesheet Component Documentation Support

Oxygen XML Editor offers built-in support for documenting XSLT stylesheets. If the expanded *QName (on page 3423)* of the element has a non-null namespace URI, the `<xsl:stylesheet>` element may contain any element not from the XSLT namespace. Such elements are referenced as user-defined data elements. Such elements can contain the documentation for the stylesheet and its elements (top-level elements whose names are in the XSLT namespace). Oxygen XML Editor offers its own XML schema that defines such documentation elements. The schema is named `stylesheet_documentation.xsd` and can be found in *`[OXYGEN_INSTALL_DIR]`*`/frameworks/stylesheet_documentation`. The user can also specify a custom schema in XSL Content Completion options *(on page 221)*.

Content Completion

When content completion is invoked inside an XSLT editor by pressing **Ctrl + Space**, it offers elements from the XSLT documentation schema (either the built-in one or one specified by user).

Adding Documentation Blocks

In **Text** mode, to add documentation blocks, press **Ctrl + Alt + D (Command + Option + D on macOS)** or select **Add component documentation** from the contextual menu.

In **Author** mode, the following stylesheet documentation actions are available in the contextual menu, **Component Documentation** submenu:

- **Add component documentation** - Adds documentation blocks for the component at the cursor position.
- **Paragraph** - Inserts a new documentation paragraph.
- **Bold** - Makes the selected documentation text bold.
- **Italic** - Makes the selected documentation text italic.
- **List** - Inserts a new list.

- **List Item** - Inserts a list item.
- **Reference** - Inserts a documentation reference.

If the cursor is positioned inside the `<xsl:stylesheet>` element context, documentation blocks are generated for all XSLT elements. If the cursor is positioned inside a specific XSLT element (such as a template or function), a documentation block is generated for that element only.

Example: Documentation Block Using Oxygen XML Editor Built-in Schema

```
<xd:doc>
  <xd:desc>
    <xd:p>Search inside parameter <xd:i>string</xd:i>
        for the last occurrence of parameter
    <xd:i>searched</xd:i>. The substring starting from the 0 position
        to the identified last occurrence will be returned.
    <xd:ref name="f:substring-after-last" type="function"
        xmlns:f="http://www.oxygenxml.com/doc/xsl/functions">See also
    </xd:ref>
    </xd:p>
  </xd:desc>
  <xd:param name="string">
    <xd:p>String to be analyzed</xd:p>
    </xd:param>
  <xd:param name="searched">
    <xd:p>Marker string. Its last occurrence will be identified</xd:p>
    </xd:param>
  <xd:return>
    <xd:p>A substring starting from the beginning of <xd:i>string</xd:i>
        to the last occurrence of <xd:i>searched</xd:i>.
        If no occurrence is found an empty string will be returned.
    </xd:p>
  </xd:return>
</xd:doc>
```

XSLT Documentation Links

Oxygen XML Editor includes support for links inside XSLT documentation blocks. Using a construct like `<xd:a docid="user-defined-id">TEXT</xd:a>` will cause the browser to scroll to the particular anchor (the defined ID) in the current document. Using a construct like `<xd:a href="http://www.my-web-site">TEXT</xd:a>` or `<xd:a href="local-file-path/filename">TEXT</xd:a>` will open the referenced link in a new tab.

Example: Documentation Links

```
<xd:doc xmlns:xd="http://www.oxygenxml.com/ns/doc/xsl" id="thisDoc">
   <xd:desc>
```

```
      <xd:p>
         <xd:ref name="test" type="variable">My test variable</xd:ref>
            <xd:a docid="thisDoc">Link to this documentation, see
the the id="thisDoc" above</xd:a>
            <xd:a docid="otherDocID" href="included.xsl">Link to
otherDocID defined in included.xsl</xd:a>
      </xd:p>
   </xd:desc>
</xd:doc>
```

Related Information:

Generating Documentation for an XSLT Stylesheet *(on page 938)*

XSLT 3.0 Text Value Templates

Oxygen XML Editor offers built-in support for XSLT 3.0 *Text Value Templates*, including content completion to present the variables, functions, and parameters from the current context and syntax highlighting.

A text node in the stylesheet is treated as a *text value template* if the following things are true:

- It is part of a sequence constructor or a child of an `<xsl:text>` instruction.
- There is an ancestor element with an `@[xsl:]expand-text` attribute and on the innermost ancestor element that has such an attribute, the value of the attribute is `yes`.

Example:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
xmlns:xs="http://www.w3.org/2001/XMLSchema"
expand-text="yes"
version="3.0">

  <xsl:param name="seq" as="xs:string*" select="'c', 'a', 'b', 'z'"/>
  <xsl:template name="main">
    {sort($seq)}
  </xsl:template>
</xsl:stylesheet>
```

For more information, see: W3C XSLT Specifications: Text Value Templates.

Related Information:

Content Completion in XPath Expressions *(on page 907)*

XSLT 3.0 Packages (xsl:package Element)

Oxygen XML Editor offers built-in support for XSLT 3.0 *Packages* (`<xsl:package>` element). This element defines a set of stylesheet modules that can be compiled as a unit, independently of other packages.

Oxygen XML Editor includes a new document template called **XSLT Package** to help you easily create an XSLT 3.0 file with the `<xsl:package>` element set as the document's root element. It is available when creating new documents from templates *(on page 377)* and can be found in the **New Document** folder or by typing *xslt package* in the search field.

Also, when editing XSLT 3.0 documents, the `<xsl:package>` element is offered as one of the proposals for the document's root element in the content completion window.

XSLT Refactoring Actions

Oxygen XML Editor offers a set of actions that allow you to change the structure of an XSLT stylesheet without changing the results of running it in an XSLT transformation. Depending on the selected text, the following XSLT refactoring actions are available from the **Refactoring** submenu of the contextual menu (or from the **Document > Refactoring** menu):

Extract template (Active only when the selection contains well-formed elements)

Extracts the selected XSLT instructions sequence into a new template. It opens a dialog box that allows you to specify the name of the new template to be created. The possible changes to perform on the document can be previewed before altering the document. After pressing OK, the template is created and the selection is replaced with the `<xsl:call-template>` instruction referencing the newly created template.

> **Note:**
> The newly created template is indented and its name is highlighted in the `<xsl:call-template>` element.

Extract function

Extracts the selected XSLT instructions sequence into a new function. It opens a dialog box that allows you to specify the name of the new function. It then moves the selected lines to a newly created XSLT function and inserts a function call in the place of the selected lines. XPath expressions are rebuilt based on the current context and the context is passed as parameters in the new functions. You can also use parts of an XPath expression to create the new functions.

Create local variable

Creates an XSLT variable, wrapped around the selection. It opens a dialog box that allows you to specify the name of the new variable. It then wraps the selection in the variable and you can reference it at anytime in the code.

Move to another stylesheet (Active only when entire components are selected)

Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet. It opens a dialog box that allows you to specify where the selected components will be moved to. Follow these steps when using the dialog box:

1. Choose whether you want to move the selected components to a new stylesheet or an existing one.
2. If you choose to move the components to an existing one, select the destination stylesheet. Click the **Choose** button to select the destination stylesheet file. Oxygen XML Editor will automatically check if the destination stylesheet is already contained by the hierarchy of the current stylesheet. If it is not contained, choose whether or not the destination stylesheet will be referenced (imported or included) from the current stylesheet. The following options are available:
   - **Include** - The current stylesheet will use an `<xsl:include>` instruction to reference the destination stylesheet.
   - **Import** - The current stylesheet will use an `<xsl:import>` instruction to reference the destination stylesheet.
   - **None** - There will be created no relation between the current and destination stylesheets.
3. Click the **Move** button to move the components to the destination. The moved components are highlighted in the destination stylesheet.

Convert attributes to xsl:attributes

Converts the attributes from the selected element and represents each of them with an `<xsl:attribute>` instruction. For example, the following element:

```
<person id="Big{test}Boss"/>
```

is converted to:

```
<person>
    <xsl:attribute name="id">
        <xsl:text>Big</xsl:text>
        <xsl:value-of select="test"/>
        <xsl:text>Boss</xsl:text>
    </xsl:attribute>
</person>
```

Convert xsl:attributes to attributes

Converts `<xsl:attribute>` elements to inline attributes for elements outside the XSL namespace. For example, the following element: It is the reverse of the **Convert attributes to xsl:attributes** action with the following limitations:

- The `<xsl:attribute>` element is "text only".
- The `<xsl:attribute>` element has a single `<xsl:text>` child element.
- The `<xsl:attribute>` element has a single `<xsl:value-of>` child element. In this case, the value of the attribute will be the XPath expression from the `@select` attribute surrounded by curly brackets (*text value template*).

```
<person>
  <xsl:attribute name="id">john.doe</xsl:attribute>
  <xsl:attribute name="email"><xsl:text>john.doe@example.com</xsl:text>
  </xsl:attribute>
  <xsl:attribute name="manager"><xsl:value-of select="person[@id='boss']/name"/>
  </xsl:attribute>
</person>
```

is converted to:

```
<person id="john.doe" email="john.doe@example.com" manager="{person[@id='boss']/name}
"/>
```

Convert xsl:if into xsl:choose/xsl:when

Converts one or more `<xsl:if>` element blocks into one or more `<xsl:when>` blocks surrounded by an `<xsl:choose>` element. If it is invoked on a selection, the selection must contain a well-formed fragment. If there is no selection, the `<xsl:if>` element that surrounds the content at the current cursor position is converted.

For example, the following block:

```
<xsl:if test="a">
  <!-- XSLT code -->
</xsl:if>
```

is converted to:

```
<xsl:choose>
    <xsl:when test="a">
        <!-- XSLT code -->
    </xsl:when>
    <xsl:otherwise>
        |
    </xsl:otherwise>
</xsl:choose>
```

where the `|` character is the current cursor position.

Convert xsl:choose/xsl:when into xsl:if

Converts each `<xsl:when>` block into an `<xsl:if>` block. For the `<xsl:otherwise>` branch, it also adds an *and* statement to each negated form of the conditions. For example, the following block:

```
<xsl:choose>
    <xsl:when test="c1">
        <!-- XSLT statement 1 -->
    </xsl:when>
    <xsl:when test="c2">
        <!-- XSLT statement 2 -->
    </xsl:when>
    <xsl:when test="c3">
        <!-- XSLT statement 3 -->
    </xsl:when>
    <xsl:otherwise>
        <!-- XSLT "otherwise" statement-->
    </xsl:otherwise>
</xsl:choose>
```

is converted to:

```
<xsl:if test="c1">
    <!-- XSLT statement 1 -->
</xsl:if>
<xsl:if test="c2">
    <!-- XSLT statement 2 -->
</xsl:if>
<xsl:if test="c3">
    <!-- XSLT statement 3 -->
</xsl:if>
<xsl:if test="not(c1) and not(c2) and not(c3)">
    <!-- XSLT "otherwise" statement-->
</xsl:if>
```

Extract local variable (Active on a selection made inside an attribute that contains an XPath expression)

Allows you to create a new local variable by extracting the selected XPath expression. After creating the new local variable before the current element, Oxygen XML Editor allows you to edit the name of the variable.

Extract global variable (Active on a selection made inside an attribute that contains an XPath expression)

Allows you to create a new global variable by extracting the selected XPath expression. After creating the new global variable, Oxygen XML Editor allows you to edit the name of the variable.

> **Note:**
> Oxygen XML Editor checks if the selected expression depends on local variables or parameters that are not available in the global context where the new variable is created.

Extract template parameter (Active on a selection made inside an attribute that contains an XPath expression)

Allows you to create a new template parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Editor allows you to edit the name of the parameter.

Extract global parameter (Active on a selection made inside an attribute that contains an XPath expression)

Allows you to create a new global parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Editor allows you to edit the name of the parameter.

> **Note:**
> Oxygen XML Editor checks if the selected expression depends on local variables or parameters that are not available in the global context where the new parameter is created.

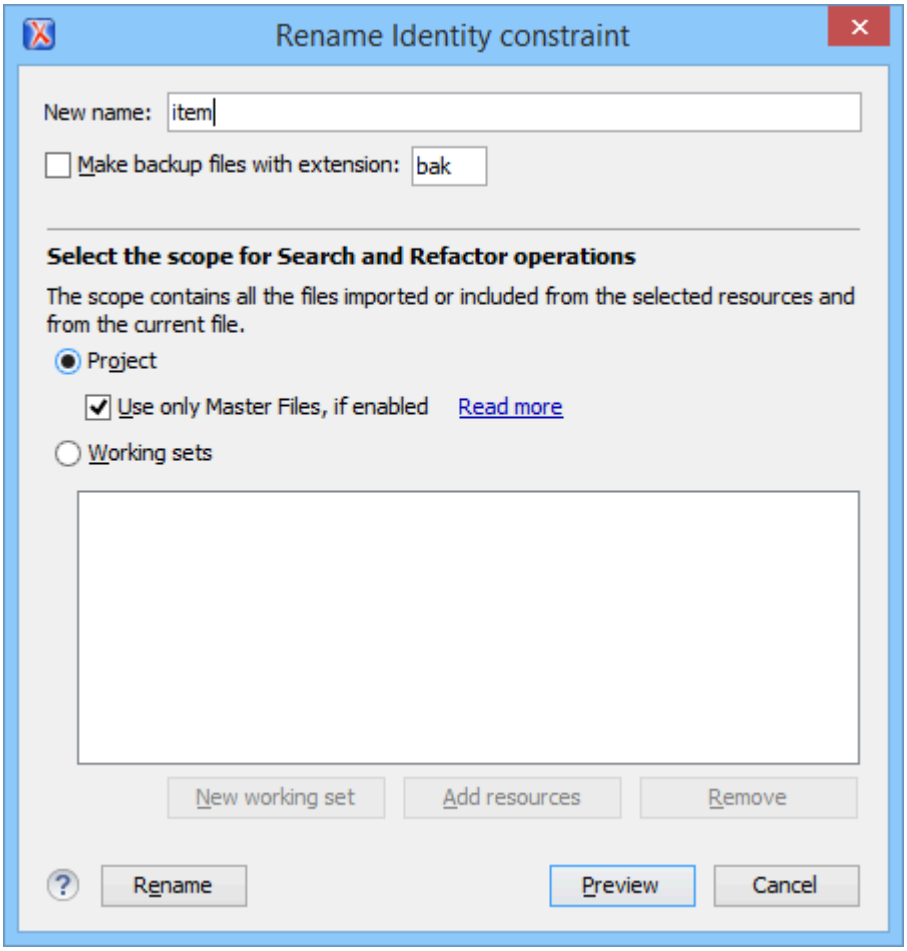
Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 275. Rename Identity Constraint Dialog Box



Note:
Many of these refactoring actions are also proposed by the *Quick Assist* support *(on page 933)*.

Resources

For more information about XSLT refactoring, watch our video demonstration:

https://www.youtube.com/embed/4ir5XWyp8Zo

XSLT Quick Assist Support

The *Quick Assist* support *(on page 3423)* helps you to rapidly access search and refactoring actions. If one or more actions are available in the current context, they are accessible via a yellow bulb help ( ) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *Quick Assist* menu by using the **Alt + 1** (**Meta + Option + 1** on macOS) keyboard shortcuts.

Two categories of actions are available in the *Quick Assist* menu:

- Actions available on a selection made inside an attribute that contains an XPath expression:

  Extract template

  Extracts the selected XSLT instructions sequence into a new template.

  Move to another stylesheet

  Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet.

  Extract local variable

  Allows you to create a new local variable by extracting the selected XPath expression.

  Extract global variable

  Allows you to create a new global variable by extracting the selected XPath expression.

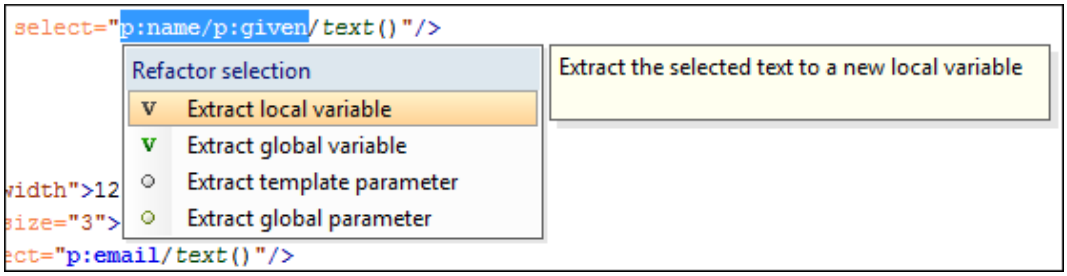
  Extract template parameter

  Allows you to create a new template parameter by extracting the selected XPath expression.

  Extract global parameter

  Allows you to create a new global parameter by extracting the selected XPath expression.

  Figure 276. XSLT Quick Assist Support - Refactoring Actions

- Actions available when the cursor is positioned over the name of a component:

  Rename Component in

  Renames the component and all its dependencies.

  Search Declarations

  Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

  Search References

  Searches all references of the component in a predefined scope.

  Component Dependencies

  Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Figure 277. XSLT Quick Assist Support - Component Actions

Search and Refactor Operations Scope *(on page 843)*

XSLT Unit Test (XSpec)

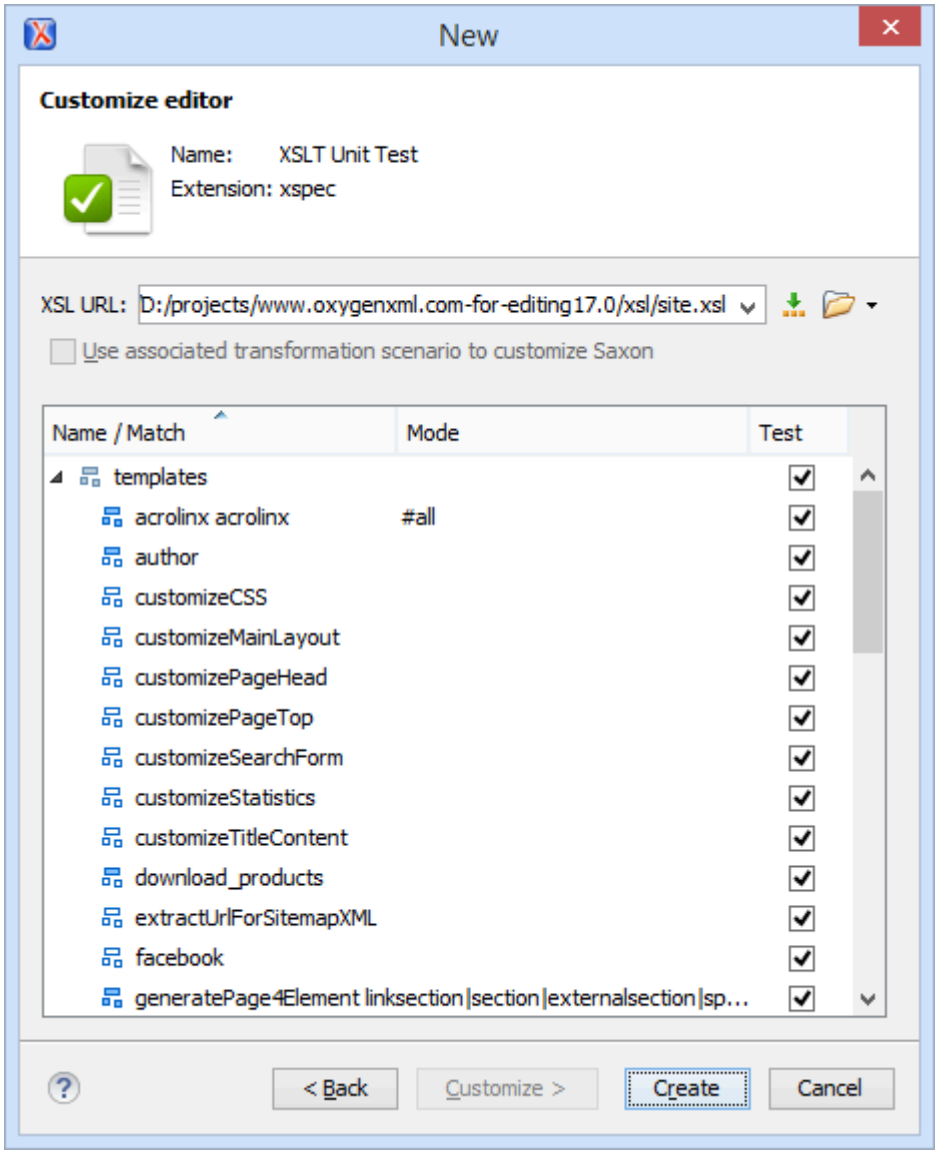
XSpec is a behavior driven development (BDD) *framework* for XSLT, XQuery, and Schematron. XSpec consists of syntax for describing the behavior of your XSLT, XQuery, or Schematron code, and some code that enables you to test your code against those descriptions.

Creating an XSLT Unit Test

To create an XSLT Unit Test, go to **File > New > XSLT Unit Test**. You can also create an XSLT Unit Test from the contextual menu of an XSL file in the **Project** view *(on page 413)*. Oxygen XML Editor allows you to customize the XSpec document when you create it. In the customization dialog box, you can enter the path to an XSL document or to a main XSL document.

When you create an XSpec document based on an XSL document, Oxygen XML Editor uses information from the validation and transformation scenarios associated with the XSL file. From the transformation scenario Oxygen XML Editor uses extensions and properties of Saxon 12.3, improving the Ant scenario associated with the XSpec document.

Figure 278. New XSLT Unit Test Wizard



Running an XSLT Unit Test

To run a Unit Test, open the XSpec file in an editor and click **Apply Transformation Scenario(s)** on the main toolbar. This will run the built-in **Run XSpec Test** transformation scenario that is defined in the XSpec *framework (on page 3420)*.

Testing a Stylesheet

An XSpec file contains one or more test scenarios. You can test a stylesheet in one of the following ways:

- **Test an entire stylesheet** - Testing is performed in a certain context. You can define a context as follows:
  - Inline context, building the test based on a string.

```
<x:scenario label="when processing a para element">
    <x:context>
```

```
        <para>...</para>
    </x:context>
    ...
</x:scenario>
```

- Based on an external file, or on a part of an external file extracted with an XPath expression.

```
<x:scenario label="when processing a para element">
    <x:context href="source/test.xml" select="/doc/body/p[1]" />
    ...
</x:scenario>
```

- **Test a function**:

```
<x:scenario label="when capitalising a string">
  <x:call function="eg:capital-case">
    <x:param select="'an example string'" />
    <x:param select="true()" />
  </x:call>
  ...
</x:scenario>
```

- **Test a template with a name**:

```
<x:scenario label="when creating a table">
  <x:call template="createTable">
    <x:param name="nodes">
      <value>A</value>
      <value>B</value>
    </x:param>
    <x:param name="cols" select="2" />
  </x:call>
</x:scenario>
```

You can reference test files between each other, which allows you to define a suite of tests. For further details about test scenarios, go to https://github.com/xspec/xspec/wiki/Writing-Scenarios.

Adding a Catalog to an XSpec Transformation

If your XSLT needs a catalog, you can add one to the XSpec transformation by doing one of the following:

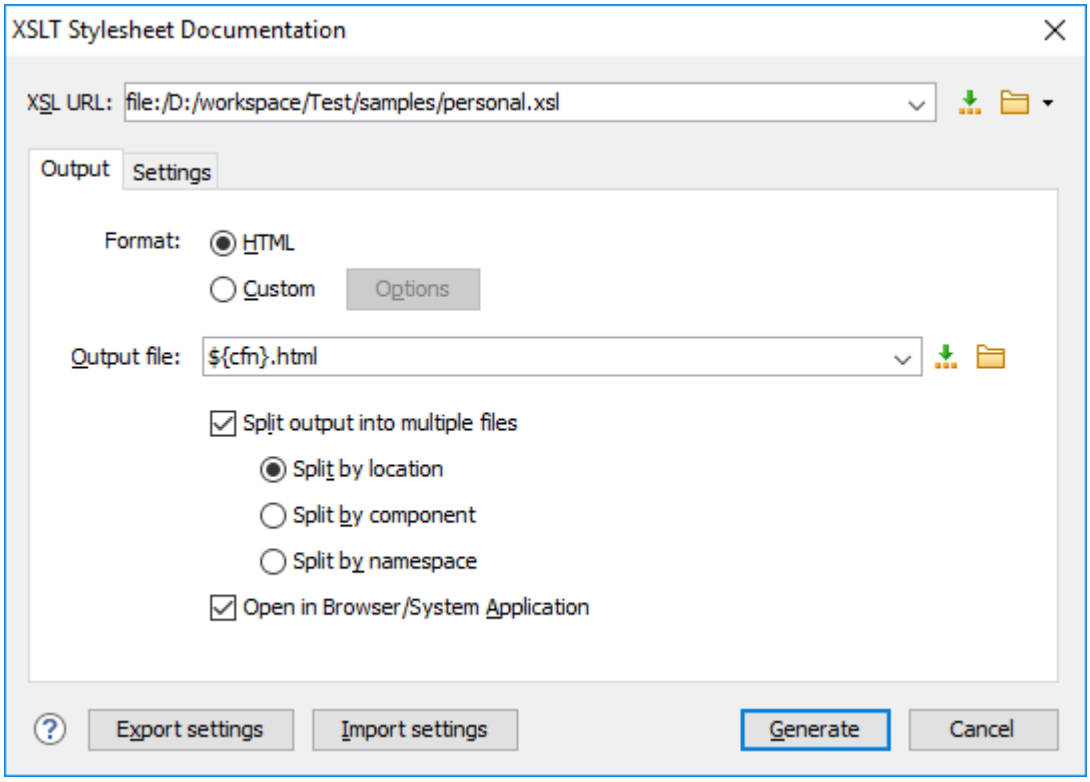
- If you are using a project *(on page 409)* in Oxygen XML Editor, create a `catalog.xml` file in the project directory. This catalog will then be loaded automatically.
- Edit *(on page 1597)* the **Run XSpec Test** transformation scenario, go to the **Parameters** tab *(on page 1548)*, and set the value of the `catalog` parameter to the location of your catalog file.

Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Editor to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for each of them. The elements are hyperlinked. To generate documentation in a custom output format *(on page 944)*, you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the **XSLT Stylesheet Documentation** dialog box, select **XSLT Stylesheet Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view *(on page 413)*. You can also open the tool by using the **Generate Documentation** toolbar button.

Figure 279. XSLT Stylesheet Documentation Dialog Box



The **XSL URL** field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

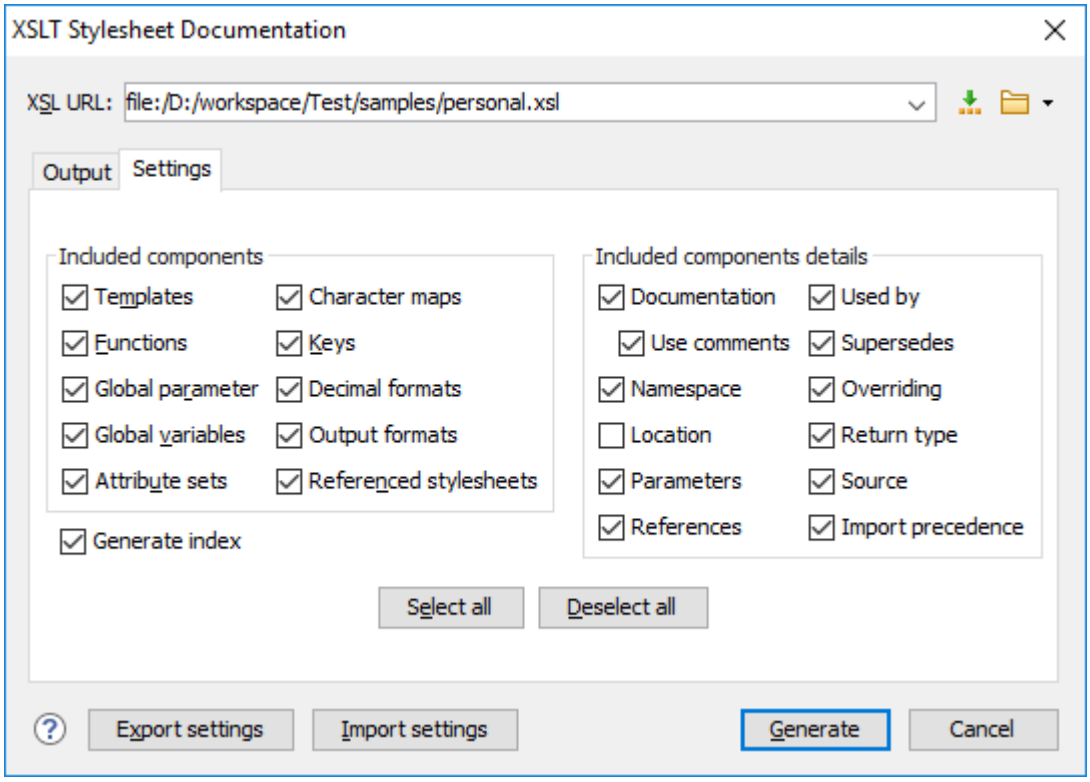
- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in HTML output format *(on page 941)*.
  - **Custom** - The documentation is generated in a custom output format *(on page 944)*, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box *(on page 945)* where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

> **Note:**
> To set the browser or system application that will be used, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

Settings Tab

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

Figure 280. Settings Tab of the XSLT Stylesheet Documentation Dialog Box



The **Settings** tab allows you to choose whether or not to include the following components: **Templates**, **Functions**, **Global parameters**, **Global variables**, **Attribute sets**, **Character maps**, **Keys**, **Decimal formats**, **Output formats**, **Referenced stylesheets**.

You can choose whether or not to include the following other details:

- **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
  - Oxygen XML Editor built-in XSLT documentation schema.
  - A subset of DocBook 5 elements. The recognized elements are: *section*, *sect1* to *sect5*, *emphasis*, *title*, *ulink*, *programlisting*, *para*, *orderedlist*, *itemizedlist*.
  - A subset of DITA elements. The recognized elements are: *concept*, *topic*, *task*, *codeblock*, *p*, *b*, *i*, *ul*, *ol*, *pre*, *sl*, *sli*, *step*, *steps*, *li*, *title*, *xref*.
  - Full XHTML 1.0 support.
  - XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.

    - DOXSL documentation *framework (on page 3420)*. Supported elements are: *codefrag*, *description*, *para*, *docContent*, *documentation*, *parameter*, *function*, *docSchema*, *link*, *list*, *listitem*, *module*, *parameter*, *template*, *attribute-set*.

      Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML *pre* element. You can change this behavior by using a custom format *(on page 944)* instead of the built-in HTML format *(on page 941)* and providing your own XSLT stylesheets.

- **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the *xsl:stylesheet* element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.
- **Namespace** - Shows the namespace for named XSLT elements.
- **Location** - Shows the stylesheet location for each XSLT element.
- **Parameters** - Shows parameters of templates and functions.
- **References** - Shows the named XSLT elements that are referenced from within an element.
- **Used by** - Shows the list of all the XSLT elements that reference the current named element.
- **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.
- **Overriding** - Shows the list of all the XSLT elements that override the current element.
- **Return type** - Shows the return type of the function.
- **Source** - Shows the text stylesheet source for each XSLT element.
- **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.
- **Generate index** - Creates an index with all the XSLT elements included in the documentation.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for generating the documentation from the command-line interface).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XSLT documentation.

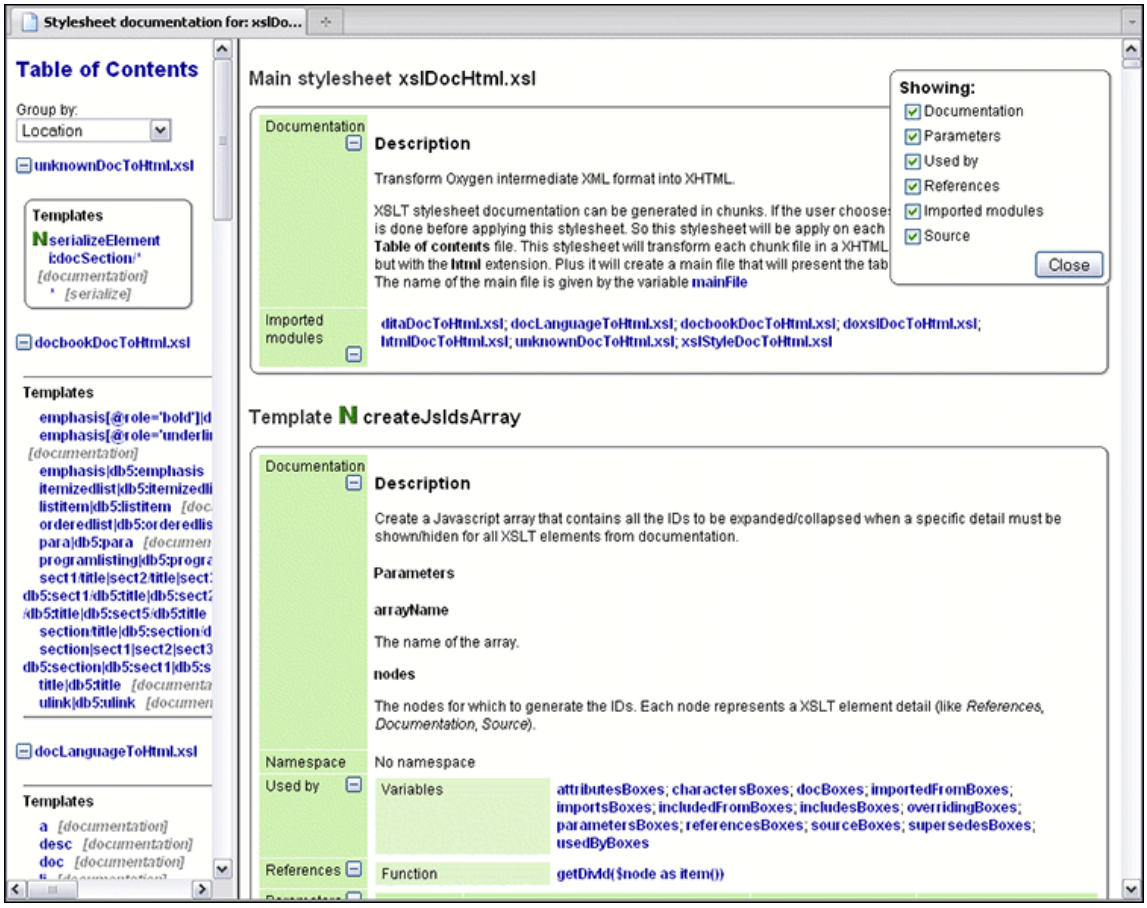
Tip:
This function can be executed from an automated command-line script, for more details, see Scripting Oxygen *(on page 3383)*.

Related Information:
XSLT Stylesheet Component Documentation Support *(on page 925)*

Generate XSLT Documentation in HTML Format

When using the XSLT Stylesheet Documentation dialog box *(on page 938)* to generate XSLT documentation in HTML format, it is presented in a visual diagram style with various sections, hyperlinks, and options.

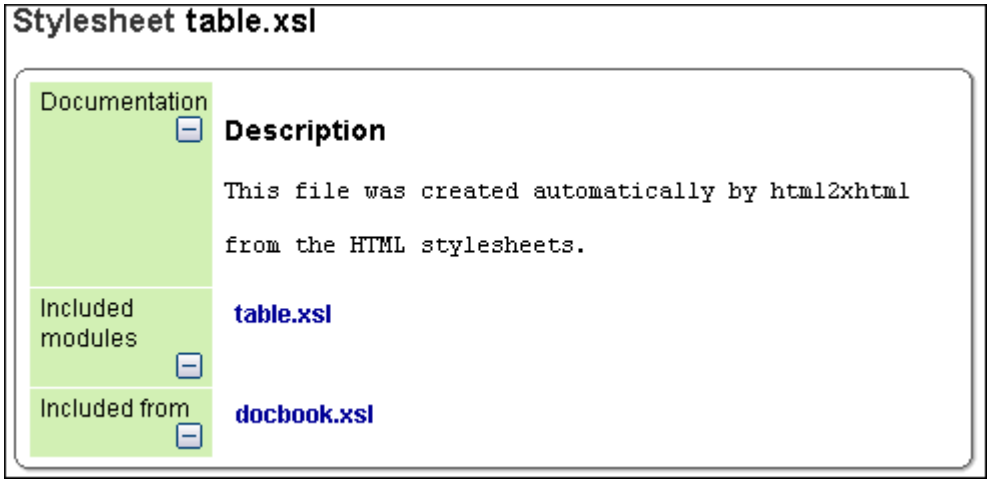
Figure 281. XSLT Stylesheet Documentation Example



The generated documentation includes the following:

- Table of Contents - You can group the contents by namespace, location, or component type. The XSLT elements from each group are sorted alphabetically (named templates are presented first and the `<match>` elements second).
- Information about main, imported, and included stylesheets. This information consists of:
  - XSLT modules included or imported by the current stylesheet.
  - The XSLT stylesheets where the current stylesheet is imported or included.
  - The stylesheet location.

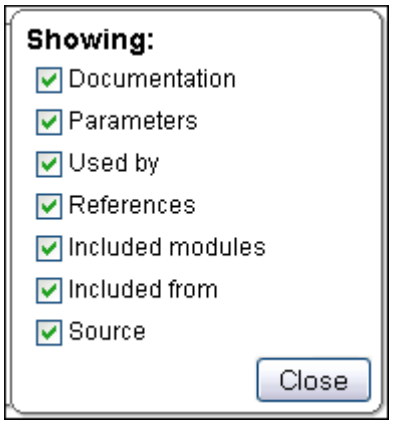
Figure 282. Information About an XSLT Stylesheet



If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped using the same criteria as the split.

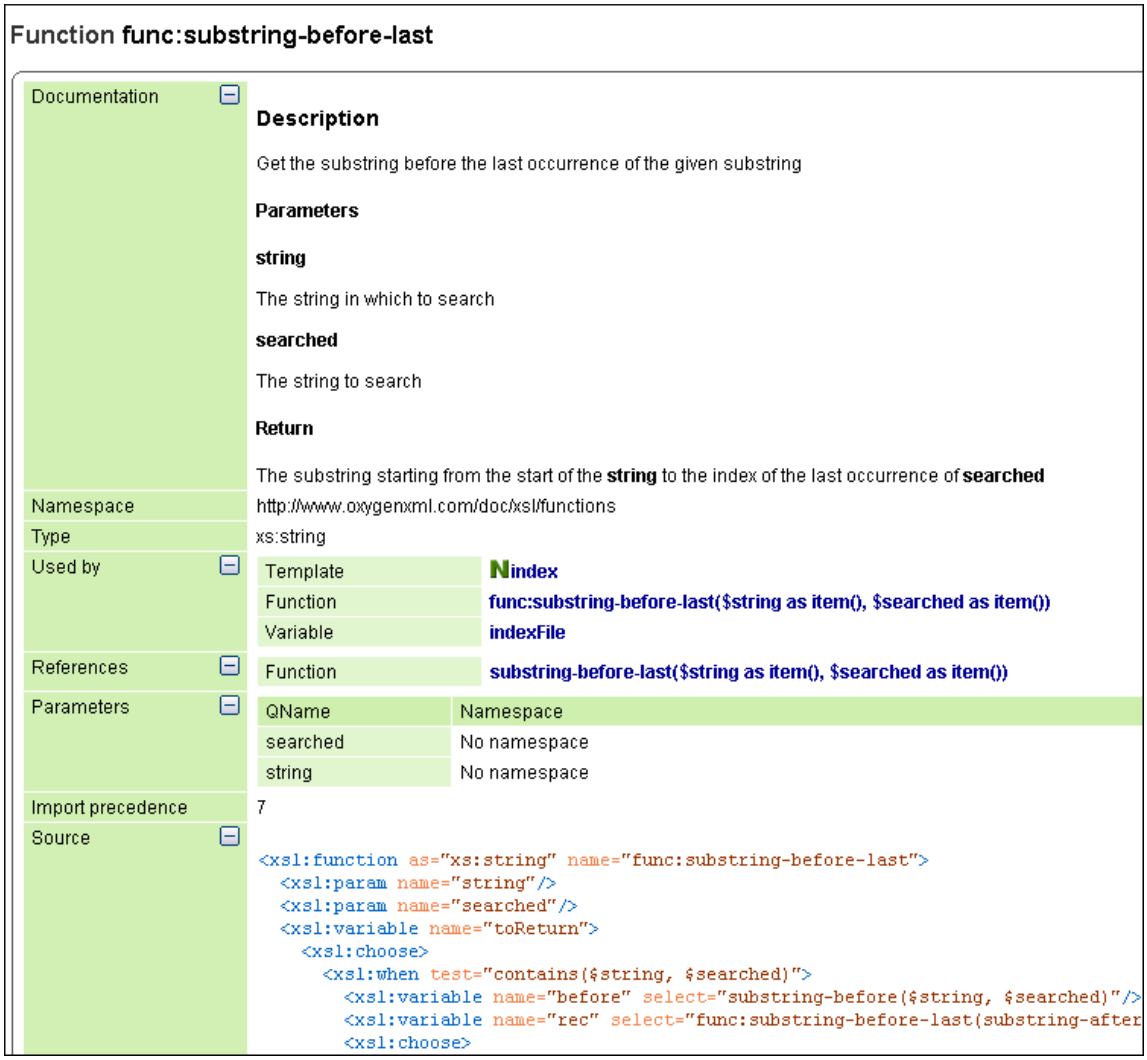
After the documentation is generated, you can collapse or expand details for some stylesheet XSLT elements by using the **Showing** options or the **Collapse** or **Expand** buttons.

Figure 283. Showing Options



For each element included in the documentation, the section presents the element type followed by the element name (value of the `@name` or `@match` attribute for match templates).

Figure 284. Documentation for an XSLT Element



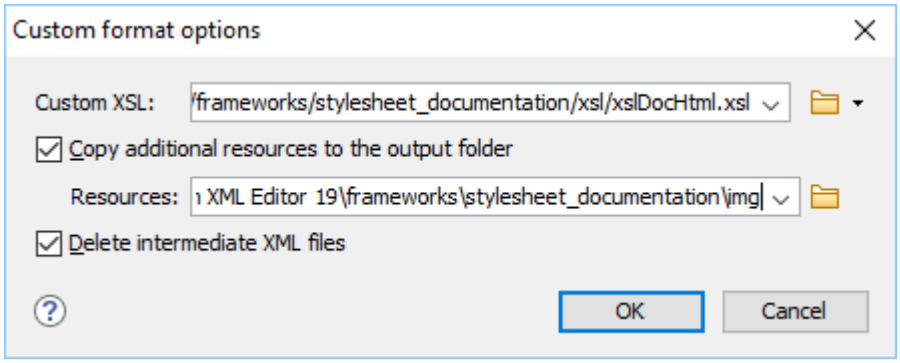
Generate XSLT Documentation in a Custom Format

XSLT stylesheet documentation can be also generated in a custom format. You must write your custom stylesheet based on the schema `xslDocSchema.xsd` from *`[OXYGEN_INSTALL_DIR]`*`/frameworks/stylesheet_documentation`. You can create a custom format starting from one of the stylesheets used in the built-in HTML, PDF, and DocBook formats. These stylesheets are available in *`[OXYGEN_INSTALL_DIR]`*`/frameworks/stylesheet_documentation/xsl`.

To generate XSLT documentation in a custom format:

1. Select **Tools > Generate Documentation > XSLT Stylesheet Documentation** to open the XSLT Stylesheet Documentation dialog box *(on page 938)*.
2. Select **Custom** for the **Format** and click the **Options** button.
3. In this next dialog box, specify your own stylesheet to transform the intermediary XML generated in the documentation process.
4. You can also choose to copy additional resources into the output folder or choose whether or not to keep the intermediate XML files created during the documentation process.
5. Click **OK** to close this dialog box and then click **Generate**.

Figure 285. Custom Format Options Dialog Box



Compiling an XSL Stylesheet for Saxon

As of Saxon 12.3, it is possible to export a compiled form of a stylesheet as a JSON or XML file (called a *stylesheet export file* or SEF). Oxygen XML Editor includes a simple tool called **Compile XSL Stylesheet for Saxon** (found in the **Tools** menu) that does this for you.

Use-Cases for a Stylesheet Export File (SEF)

- **Use Saxon-JS to run transformations in a browser** - A *stylesheet export file* (SEF) is needed if you want to use the Saxon-JS product to run transformations in a browser, as in the following example:

```
<script type="text/javascript" src="SaxonJS/SaxonJS.min.js"></script>
<script>
    window.onload = function() {
      SaxonJS.transform({
         stylesheetLocation: "books.sef",
         sourceLocation: "books.xml"
         });
    }
</script>
```

- **Use SEF to run transformations in Oxygen XML Editor** - You can also use a *stylesheet export file* (SEF) in Oxygen XML Editor to apply an XSLT transformation over an XML file. This requires **Saxon-EE** or **Saxon-PE** versions of the Saxon product and you must select one of those two versions for the **Target** when you configure the SEF file *(on page 946)*. When configuring the XSLT transformation, you will specify the SEF file in the **XSL URL** field *(on page 1505)*.

Compiling an SEF File

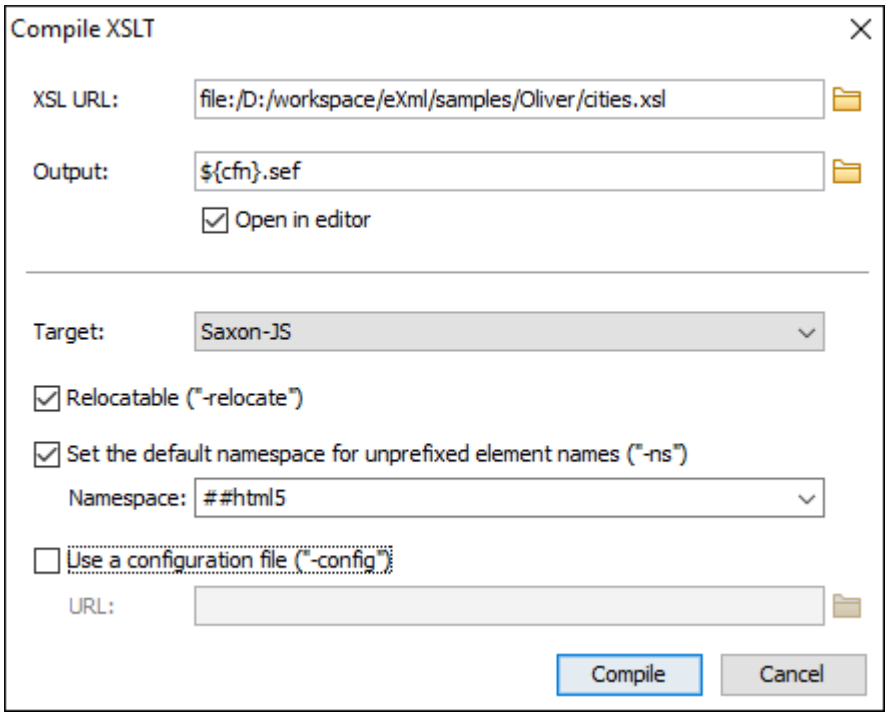
The **Compile XSL Stylesheet for Saxon** tool can be found in the **Tools** menu and it compiles a specified stylesheet as a JSON or an XML file (*stylesheet export file*).

If you choose **Saxon-JS** as the **Target** (the type of Saxon product that the export file will be used with), then the compiled stylesheet will be a JSON file with a file extension of `.sef` by default.

If you choose **Saxon-EE**, **Saxon-PE**, or **Saxon-HE** for the **Target**, then the compiled stylesheet will be an XML file with a file extension of `.xsef` by default.

Selecting this tool opens the **Compile XSL Stylesheet for Saxon** dialog box that allows you to configure some options for conversion.

Figure 286. Compile XSLT Stylesheet for Saxon Dialog Box



This dialog box includes the following options:

XSL URL

Allows you to select URL of the source XSL stylesheet. You can specify the URL by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down list.

Output file

You can specify the path where the output file will be saved by entering it in the text field, using the **Insert Editor Variables** button, or using the browsing actions in the **Browse** drop-down list.

Open in Editor

Select this option to open the resulting *stylesheet export file* in the main Oxygen XML Editor editing pane.

Target

Allows you to select the type of Saxon product that the export file will be used with. You can choose **Saxon-JS**, **Saxon-EE**, **Saxon-PE**, or **Saxon-HE**.

Relocatable

Can be used to control the Saxon `-relocate` parameter. You can select this option to produce a *relocatable* export package (SEF) that can be deployed to a different location, with a different base URI.

Set the default namespace for unprefixed element names ("-ns")

Can be used to control the `-ns:(uri|##any|##html5)` Saxon parameter that defines the handling of unprefixed element names that appear as name tests in path expressions and match patterns in the stylesheet:

- The **##any** value declares that unprefixed names are treated as a test on the local name of the element only. They will match regardless of namespace.
- The **##html5** value declares that an unprefixed element name will match either a name in the XHTML namespace or a name in no namespace. This option is primarily intended for use when generating stylesheets to run under Saxon-JS in the browser since the resulting behavior is close to that defined by the special rules in the HTML5 specification for XSLT and XPath running against an HTML5 DOM.
- You can also specify a valid URI by editing the value in the combo box. Specifying a URI sets the default namespace for elements and types (effectively a default value for `xpath-default-namespace`). Note that an explicit value for this attribute takes precedence.

Use a configuration file ("-config")

Select this option if you want to use a Saxon 12.3 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the **URL** field, or by using the **Insert Editor Variables** button, or using the browsing actions in the **Browse** drop-down list.

Compile

Use this button to generate the *stylesheet export file* according the options selected in this dialog box.

Editing Ant Build Files

Oxygen XML Editor includes an Ant editor that provides a variety of specialized features to assist you with creating and editing Ant build files. The editor includes some specialized views, content completion assistance, automatic validation, syntax highlighting, *Quick Assist (on page 3423)* and *Quick Fix (on page 3423)* support, as well as numerous common editing and search features.

Related Information:
Editing XML Documents in Text Mode *(on page 527)*

Modular Contextual Ant Build File Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex Ant build file cannot be correctly edited or validated individually due to their interdependency with other modules. For example, a *target* defined in a main build file

is not visible when you edit an included or imported module. Oxygen XML Editor provides support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger Ant build structure.

You cat set a main Ant build file either by using the *main files* support from the **Project** view *(on page 428)*, or a validation scenario *(on page 948)*.

To set a *main file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main build file. In this case, it considers the current module as the main build file.

The advantages of editing in the context of *main file (on page 3421)* include:

- Correct validation of a module in the context of a larger build structure.
- *Content Completion Assistant (on page 3418)* displays all components valid in the current context.
- The **Outline** view *(on page 951)* displays the components collected from the entire build file structure.

Validating Ant Build Files

Oxygen XML Editor performs the validation of Ant build files with the help of a built-in processor, which is largely based on the *Apache Ant (on page 3417)* libraries. The path to these libraries can be configured in the **Ant** preferences page *(on page 274)*. The validation processor accesses the parameters set in the associated Ant transformation scenario *(on page 1548)* and uses them as Ant properties when validating the current build script.

Oxygen XML Editor automatically validates Ant build files as you type. You can also validate the currently edited file by selecting the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu.

Tip:
To make a custom task available in the Ant validation engine, add a *JAR (on page 3420)* file that contains the task implementation to the library directory of the built-in Ant distribution that comes bundled with Oxygen XML Editor (for example, `[OXYGEN_INSTALL_DIR]/tools/ant/lib` folder).

Create a Validation Scenario for Ant Build Files

If you want to customize the validation process for Ant build files, you can create a new validation scenario (or configure an existing one). For example, if you want to validate interrelated modules that define a complex Ant build file, you can specify the main Ant file by configuring a validation scenario. To create or configure a validation scenario, select **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu or the **Document > Validate** menu.

Passing parameters to the Ant validation engine

Ant validation scenarios cannot be configured to accept custom Ant parameters. However, you can specify values for the parameters in your Ant document using an Ant transformation scenario:

1. Create a new Ant transformation scenario *(on page 1546)*.
2. Edit the transformation scenario and set all parameters *(on page 1548)* you need to pass to your Ant document.
3. Associate the new scenario with your Ant document (in the **Configure Transformation Scenarios(s)** dialog box *(on page 1600)*). You do not need to run the transformation scenario. Every time a validation operation is triggered, the built-in validation engine uses the parameters set in the transformation scenario.

> **Note:**
> This behavior is available only for the validation scenarios that use the built-in validation engine. The custom defined validation engines do not benefit from this functionality.

Transforming Ant Build Files

Oxygen XML Editor includes a few built-in transformation scenarios that allow you to transform Ant build files. They are listed in the **Ant** section in the **Configure Transformation Scenario(s)** dialog box *(on page 1600)*:

- **Ant** - This transformation scenario runs as an external process that executes the Ant build script with the built-in Ant distribution (*Apache Ant (on page 3417)* version 1.9.8) that is included with Oxygen XML Editor, or optionally with a custom Ant distribution configured in the scenario.
- **Ant (*with Saxon-HE XSLT support*)** - This transformation scenario allows Ant XSLT tasks to be performed using Saxon 9 Home Edition libraries that come bundled with Oxygen XML Editor and all defined XML catalogs are also taken into account during the transformation.

> **Tip:**
> Certain Ant tasks require additional JAR libraries (for example, Ant *mail* tasks). The additional libraries can be added by editing the Ant transformation scenario, and in the **Output** tab, click the **Libraries** button *(on page 1547)* in the bottom right corner. This opens a dialog box where you can add JAR libraries. For a list of library dependencies, see https://ant.apache.org/manual/install.html#librarydependencies.

Related Information:

Editing a Transformation Scenario *(on page 1597)*
Configure Transformation Scenario(s) Dialog Box *(on page 1600)*
Applying Associated Transformation Scenarios *(on page 1600)*
Ant Transformation *(on page 1546)*

Ant Quick Fix Support

The Oxygen XML Editor *Quick Fix* support *(on page 3423)* helps you resolve missing target reference errors that may occur when developing Ant build documents.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a *Quick Fix* is available for that particular error or warning, you can access the *Quick Fix* proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip pop-up window.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon () is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor displays the list of available fixes.
- With the cursor placed in the highlighted area of the error or warning, you can also invoke the *Quick Fix* menu by pressing **Alt + 1 (Command + Option + 1 on macOS)** on your keyboard.

Oxygen XML Editor provides the following types of *Quick Fixes* for Ant build files:

- **Create new target** - Creates a new target with the specified name.
- **Change reference to "targetName"** - Corrects the reference to point to an already defined target.
- **Remove target reference** - Removes the erroneous reference.

Content Completion in Ant Build Files

The list of proposals offered by the *Content Completion Assistant (on page 3418)* in Ant build files are context-sensitive and includes proposals that are valid at the current cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

The *Content Completion Assistant* proposes various item types that are defined in the current Ant build and in the imported and included builds. The proposals include:

- Element names
- Attribute names
- Property names

Note:
In addition to the user-defined properties, the *Content Completion Assistant* offers the following values:
  - The system properties set in the Java Virtual Machine.
  - The built-in properties that Ant provides.

- Target names
- Task and type reference IDs

Tip:
To make a custom task available in the *Content Completion Assistant*, add a *JAR (on page 3420)* file that contains the task implementation to the library directory of the built-in Ant distribution that comes bundled with Oxygen XML Editor (for example, `[OXYGEN_INSTALL_DIR]/tools/ant/lib` folder).

Note:
For Ant resources, the proposals are collected starting from the *main files (on page 3421)*. The *main files* can be defined in the project or in the associated validation scenario. For further details about the *Main Files* support go to Defining Main Files at Project Level *(on page 428)*.

Related Information:
http://ant.apache.org/manual/properties.html

Syntax Highlighting in Ant Files

Oxygen XML Editor supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for Ant build files, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*.
2. Go to **Editor > Syntax Highlight** *(on page 233)*.
3. Select and expand the **Ant Property** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

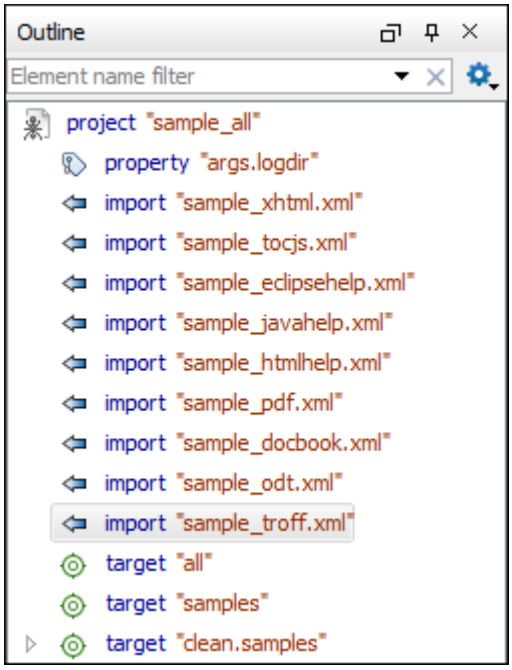
Related Information:
Syntax Highlight Preferences *(on page 233)*

Ant Outline View

The **Outline** view for Ant files displays the list of all the components (properties, targets, extension points, task/type definitions and references) from both the edited Ant build file and its imported and included modules. For Ant resources, the **Outline** view collects its components starting from the *main files (on page 3421)*. The *main files* can be defined in the project and the main build file can be specified in a validation scenario. For more details, see Defining Main Files at Project Level *(on page 428)*.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 287. Ant Outline View



The following actions are available in the **Settings** menu on the Outline view toolbar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches. By default, this filter is not selected.

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the Ant editor. Selecting one of the components from the outline view also selects the corresponding item in the source document.

When the **Show components** option is selected, the following actions are available:

Show XML structure

Displays the XML document structure in a tree-like manner.

Sort

Sorts the components in the **Outline** view alphabetically.

Show all components

Displays all components that were collected starting from the *main file (on page 3421)*. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/type

The build file components can be grouped by location and type.

When the **Show XML structure** option is selected, the following actions are available:

Show components

Switches the **Outline** view to the components display mode.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel *(on page 315)*.

Configure displayed attributes

Displays the **XML Structured Outline** preferences page *(on page 315)*.

The following actions are available in the contextual menu of the **Outline** view (when the **Show XML structure** option is selected in the **Settings** menu:

Append Child

Displays a list of elements that can be inserted as children of the current element.

Insert Before

Displays a list of elements that can be inserted as siblings of the current element, before the current element.

Insert After

Displays a list of elements that can be inserted as siblings of the current element, after the current element.

Edit Attributes

Displays an in-place attribute editing window.

Toggle Comment

Comments/uncomments the currently selected element.

Search References Ctrl + Shift + R (Command + Shift + R on macOS)

Searches all references of the item found at current cursor position in the defined scope. See Find References and Declarations of Ant Components *(on page 958)* for more details.

Search References in

Searches all references of the item found at current cursor position in the specified scope. See Find References and Declarations of Ant Components *(on page 958)* for more details.

Component Dependencies

Opens the Ant **Component Dependencies** view *(on page 956)* that allows you to see the dependencies for the currently selected component.

Rename Component in

Renames the selected component. See Ant Refactoring Actions *(on page 958)* for more details.

Cut, Copy, Delete

Executes the typical editing actions on the currently selected component.

Expand More

Expands recursively all sub-components of the selected component.

Collapse All

Collapses recursively all sub-components of the selected component.

You can search a component in the **Outline** view by typing its name in the filter text field at the top of the view or directly on the tree structure. When you type the component name in the text field, you can switch to the tree structure using the following:

- **Down** arrow key
- **Tab** key
- **Shift-Tab** key combination

To switch from tree structure to the filter text field, you can use **Tab** and **Shift-Tab**.

Tip:
The search filter is case insensitive. The following wildcards are accepted:

- ***** - any string
- **?** - any character
- **,** - patterns separator

If no wildcards are specified, the string to search is used as a partial match (such as ***textToFind***).

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

Oxygen XML Editor has a predefined order for the groups in the **Outline** view:

- For location, the names of the files are sorted alphabetically. The file you are editing is located at the top of the list.
- For type, the order is: properties, targets, references.

> **Note:**
> When no grouping is available Oxygen XML Editor sorts the components depending on their order in the document. Oxygen XML Editor also takes into account the name of the file that the components are part of.

Ant Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for an Ant build file by analyzing imported or included build files. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If you want to see the references or dependencies of a build file, select it in the **Project** view *(on page 413)* and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

Refresh

Refreshes the resource structure.

Stop

Stops the computing.

Show hierarchy for

Computes the hierarchical structure of the references for a resource.

Show dependencies for

Computes the structure of the dependencies for a resource.

Configure dependencies search scope

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

 **Add to Main Files**

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

Tip:
When a recursive reference is encountered in the view, the reference is marked with a special icon .

Ant Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To see the dependencies of an Ant component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for the following components: *properties*, *targets*, *extension-points*, and *references* (those that have an ID set).

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:
Search and Refactor Operations Scope *(on page 843)*

Highlight Component Occurrences

When a component (for example *property* or *target*) is found at the current cursor position, they are highlighted in both the document and in the stripe bar at the right side of the document. Oxygen XML Editor also supports occurrences highlight for type and task references.

Customizable colors are used (one for the component definition and another one for component references). Occurrences are displayed until another component is selected and a new search is performed. All highlights are removed when you start to edit the document.

This feature is enabled by default. To configured it, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Mark Occurrences**. If your particular type of file is not selected, you can perform this search by going to **Search > Search Occurrences in File Ctrl + Shift + U (Command + Shift + U on macOS)** in the contextual menu. Matches are displayed in separate tabs of the **Results** view *(on page 558)*.

Related Information:
Mark Occurrences Preferences *(on page 234)*

Find References and Declarations of Ant Components

The following search actions related to references and declarations of Ant components are available from the **Search** submenu of the contextual menu and from the **Document > References** menu::

Search References

Searches all references of the item found at the current cursor position in the defined scope.

Search References in

Searches all references of the item found at the current cursor position in the file or files that you specify after selecting a scope for the search operation.

Search Declarations

Searches all declarations of the item found at the current cursor position in the defined scope.

Search Declarations in

Searches all declarations of the item found at the current cursor position in the file or files that you specify when defining a new scope.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

Go to Definition

Moves the cursor to the location of the definition of the current item.

> **Note:**
> You can also use the **Ctrl + Single-Click (Command + Single-Click on macOS)** shortcut on a reference to display its definition.

Related Information:
Search and Refactor Operations Scope *(on page 843)*

Ant Refactoring Actions

The following refactoring actions can be applied on *targets*, *extension-points*, *properties*, and *references* and allow you to consistently rename a component in the entire Ant build file structure. They are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

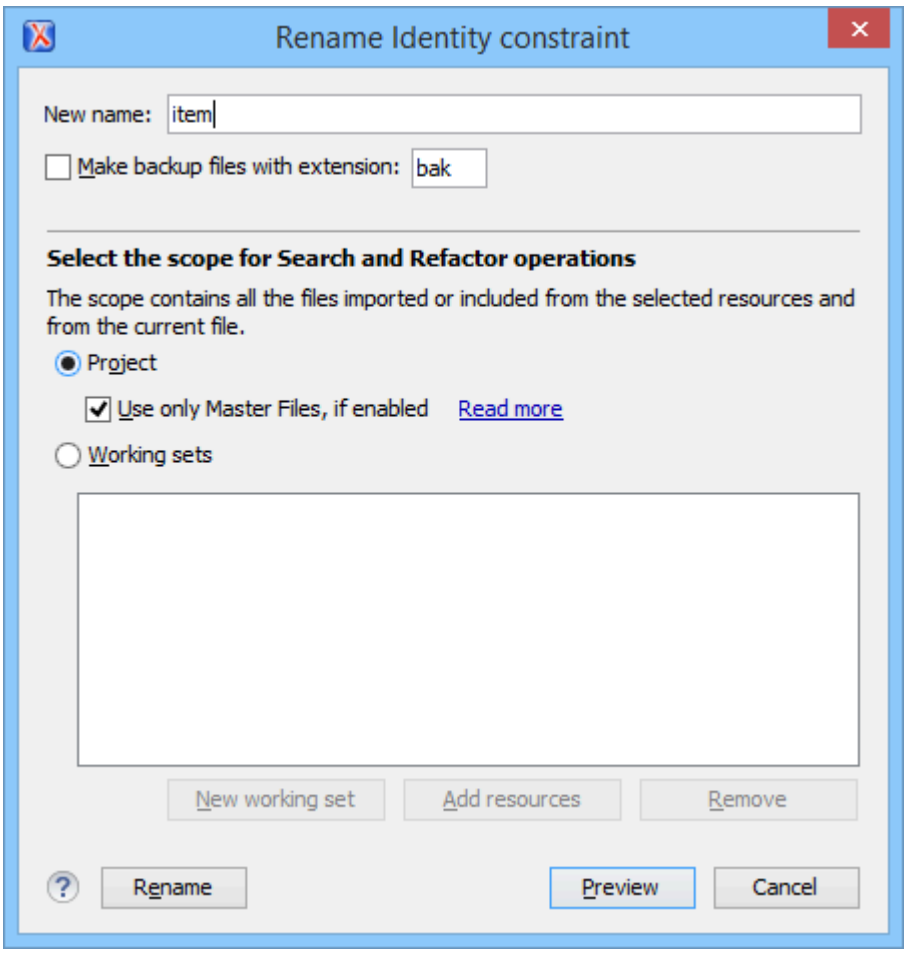
Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 288. Rename Identity Constraint Dialog Box



Ant Quick Assist Support

The *Quick Assist* support *(on page 3423)* helps you to rapidly access search and refactoring actions. If one or more actions are available in the current context, they are accessible via a yellow bulb icon ( ) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *Quick Assist* menu by using the **Alt + 1** (**Meta + Option + 1** on macOS) keyboard shortcuts.

The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Editing XML Schemas (XSD)

An XML Schema (XSD) describes the structure of an XML document and is used to validate XML document instances against it, to check that the XML instances conform to the specified requirements. If an XML instance conforms to the schema then it is said to be valid. Otherwise, it is invalid.

Oxygen XML Editor offers support for both XML Schema 1.0 and 1.1 and you can edit XML Schema files in the following editing modes:

- **Text editing mode *(on page 1002)*** - Allows you to edit XML Schema files in a source editing mode.
- **Grid editing mode *(on page 363)*** - Displays XML Schema files in a structured spreadsheet-like grid.
- **Design editing mode *(on page 364)*** - Visual schema designer that helps you understand the structure and develop complex schemas.
- **Author editing mode *(on page 598)*** - The visual **Author** mode is also available for XML Schema, allowing you to visually edit the schema annotations. It presents a polished and compact view of the XML Schema, with support for links on imported/included schemas.

For information about applying and detecting schemas, see Associating a Schema to XML Documents *(on page 827)*.

Resources

For more information about editing XML Schemas, see our video demonstration:

https://www.youtube.com/embed/vz1eIZELQgc

Related Information:
Associating a Schema to XML Documents *(on page 827)*

XML Schema Design Mode (XML Schema Diagram Editor)

This section includes topics that describe how to work with XML Schema documents in **Design** mode, including various features, actions that are available, and much more.

The **Design** mode in Oxygen XML Editor provides a simple and expressive XML Schema diagram editor for working with XML Schema documents. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

To switch to this mode, select **Design** at the bottom of the editing area. 
The diagram font can be increased using the usual Oxygen XML Editor shortcuts: **(Ctrl + "+" (Meta + "+" on macOS))**, **(Ctrl +"-" (Meta +"-" on macOS))**, **(Ctrl + 0 (Meta + 0 on macOS))** or **(Ctrl + mouse wheel (Meta + mouse wheel on macOS))**. The whole diagram can also be zoomed with one of the predefined factors available in the Schema preferences panel *(on page 206)*. The same zoom factor is applied for the print and save actions.

Resources

For more information about designing XML Schemas, watch our video demonstration:

https://www.youtube.com/embed/vz1eIZELQgc

Navigation in the XML Schema Design Mode

The following editing and navigation features work for all types of schema components in the XML Schema **Design** mode:

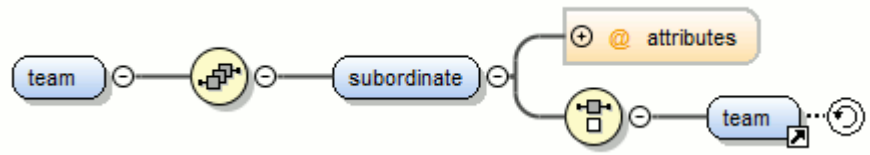
- Move/reference components in the diagram using drag-and-drop actions.
- Select consecutive components on the diagram (components from the same level) using the *Shift* key. You can also make discontinuous selections in the schema diagram using the **Ctrl (Meta on macOS)** key. To deselect one of the components, use **Ctrl + Single-Click (Command + Single-Click on macOS)**.
- Use the arrow keys to navigate the diagram vertically and horizontally.

- Use *Home*/*End* keys to jump to the first/last component from the same level. Use **Ctrl + Home (Command + Home on macOS)** key combination to go to the diagram root and **Ctrl + End (Command + End on macOS)** to go to the last child of the selected component.
- You can easily go back to a previously visited component while moving from left to right. The path will be preserved only if you use the left arrow key or right arrow key. For example, if the current selection is on the second attribute from an attribute group and you press the left arrow key to jump to the attribute group, when you press the right arrow key, then the selection will be moved to the second attribute.
- Go back and forward between components viewed or edited in the diagram by selecting them in the **Outline** view *(on page 1006)*:
  - **Back** (go to previous schema component).
  - **Forward** (go to next schema component).
  - **Go to Last Modification** (go to last modified schema component).
- Copy, reference, or move global components, attributes, and identity constraints to another position and from one schema to another using the **Cut/Copy** and **Paste/Paste as Reference** actions.
- Go to the definition of an element or attribute with the **Go to Definition** action.
- Search in the diagram using the Find/Replace dialog box *(on page 442)* or the Quick find toolbar *(on page 456)*. You can find/replace components only in the current file scope.
- You can expand and see the contents of the imports/includes/redefines in the diagram. To edit components from other schemas, the schema for each component will be opened as a separate file in Oxygen XML Editor.

> **Tip:**
> If an XML Schema referenced by the currently open schema was modified on disk, the change will be detected and you will be asked to refresh the current schema contents.

- Recursive references are marked with a *recurse symbol* (). Click this symbol to navigate between the element declaration and its reference.

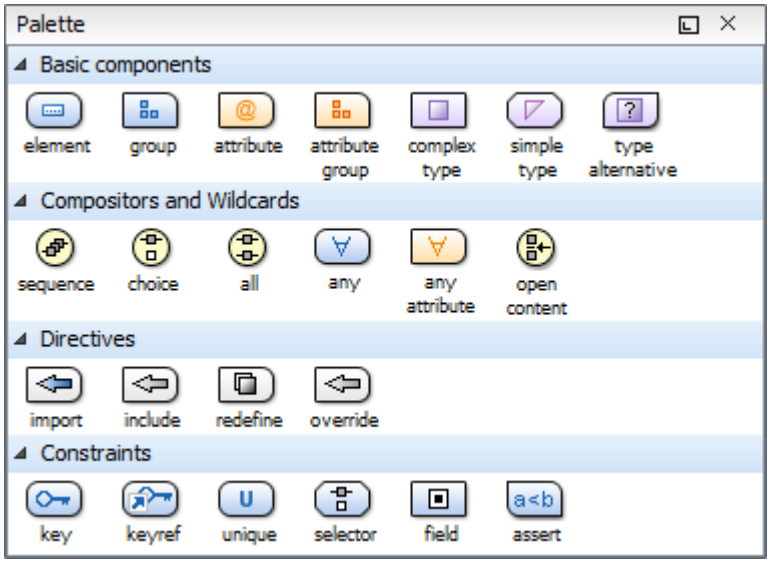
Figure 289. Recursive Reference



XML Schema Palette View (Available in Design Mode)

The **Palette** view is designed to offer quick access to XML Schema components and to improve the usability of the XML Schema diagram builder. You can use the **Palette** to drag and drop components in the **Design** mode. The components offered in the **Palette** view depend on the XML schema version set in the **XML Schema** preferences page *(on page 247)*. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 290. Palette View



Components are organized functionally into 4 collapsible categories:

- Basic components: *elements*, *group*, *attribute*, *attribute group*, *complex type*, *simple type*, *type alternative*.
- Compositors and Wildcards: *sequence*, *choice*, *all*, *any*, *any attribute*, *open content*.
- Directives: *import*, *include*, *redefine*, *override*.
- Identity constraints: *key*, *keyref*, *unique*, *selector*, *field*, *assert*.

> **Note:**
> The *type alternative*, *open content*, *override*, and *assert* components are available for XML Schema 1.1.

To add a component to the edited schema:

- Click and hold a graphic symbol from the **Palette** view, then drag the component into the **Design** view.
- A line dynamically connects the component with the XML schema structure.
- Release the component into a valid position.

> **Note:**
> You cannot drop a component into an invalid position. When you hover the component into an invalid position, the mouse cursor changes its shape into ⃠. Also, the connector line changes its color from the usual dark gray to the color defined in the **Validation error highlight color** option *(on page 235)* (default color is red).

Resources

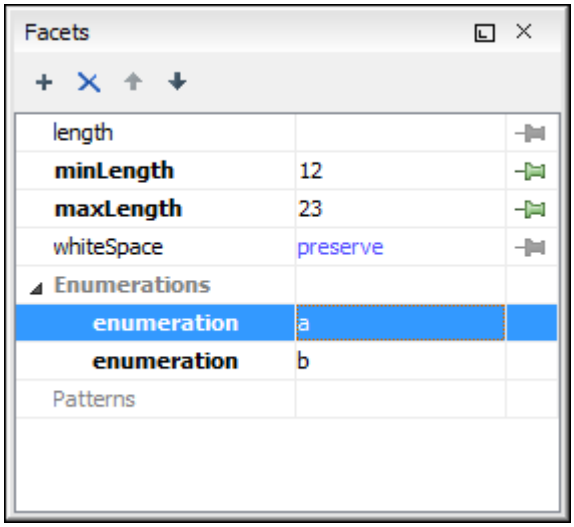
For more information about the Schema palette, watch our video demonstration:

https://www.youtube.com/embed/KalHUXmpuAA

XML Schema Facets View (Available in Design Mode)

The **Facets** view for XML Schemas presents the facets for the selected component, if available. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 291. Facets View



The default value of a facet is rendered in the **Facets** view with a blue color. The facets that can not be edited are rendered with a gray color. The grouping categories (for example: **Enumerations** and **Patterns**) are not editable. If these categories contain at least one child they are rendered with bold. Bold facets are facets with values set explicitly to them.

Important:
Usually inherited facets are presented as default in the **Facets** view but if patterns are inherited from a base type and also specified in the current simple type only the current specified patterns will be presented. You can see the effective pattern value obtained by combining the inherited and the specified patterns as a tooltip on the **Patterns** category.

Facets for components that do not belong to the currently edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a facet by double-clicking it or by pressing Enter, when that facet is selected. For some facets you can choose valid values from a list or you can specify another value. If a facet has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, facets with errors are presented with red and the facets with warnings with yellow. You can customize the error colors from the Document Checking user preferences *(on page 235)*.

The **Facets** view provides the following actions in its toolbar and contextual menu:

Add

Allows you to add a new enumeration or a new pattern.

Remove

Allows you to remove the value of a facet.

Edit Annotations

Allows you to edit an annotation for the selected facet.

Move Up

Allows you to move up the current enumeration/pattern in **Enumerations/Patterns** category.

Move Down

Allows you to move down the current enumeration/pattern in **Enumerations/Patterns** category.

Copy

Copy the attribute value.

Open in Regular Expressions Builder

Rather than editing regular expressions manually, this action allows you to open the pattern in the XML Schema Regular Expressions Builder *(on page 1041)* that guides you through the process of testing and constructing the pattern..

Facets can be fixed to prevent a derivation from modifying its value. To fix a facet value just click the **Pin** button.

Schema Editing Actions

You can edit an XML schema using drag and drop operations or contextual menu actions.

Drag and drop is the easiest way to move the existing components to other locations in an XML schema. For example, you can quickly insert an element reference in the diagram with a drag and drop from the **Outline** view *(on page 1006)* to a compositor in the diagram. Also, the components order in an `<xs:sequence>` can be easily changed using drag and drop.

If this property has not been set, you can easily set the attribute/element type by dragging over it a simple type or complex type from the diagram. If the type property for a simple type or complex type is not already set, you can set it by dragging over it a simple or complex type.

Depending on the drop area, various actions are available:

- **Move** - Context dependent, the selected component is moved to the destination.
- **Reference** - Context dependent, the selected component is referenced from the parent.
- **Copy** - If the **Ctrl (Meta on macOS)** key is pressed, a copy of the selected component is inserted to the destination.

Visual clues about the operation type are indicated by the mouse pointer shape:

-  - When moving a component.
-  - When referencing a component.
-  - When copying a component.

You can edit some schema components directly in the diagram. For these components, you can edit the name and the additional properties presented in the diagram by double-clicking the value you want to edit. If you want to edit the name of a selected component, you can also press **Enter**. The list of properties that can be displayed for each component can be customized in the Preferences *(on page 206)*.

When editing references, you can choose from a list of available components. A component from an imported schema whose target namespace does not have an associated prefix is displayed in the list as `componentName#targetNamespace`. If the reference is from a target namespace that was not yet mapped, you are prompted to add prefix mappings for the inserted component namespace in the currently edited schema.

You can also change the compositor by double-clicking it and choose the compositor you want from the proposals list.

There are some components that cannot be edited directly in the diagram: imports, includes, redefines. The editing action can be performed if you double-click or press **Enter** on an import/include/redefine component. An edit dialog box is displayed, allowing you to customize the directives.

Contextual Menu Actions in the Design Mode

The contextual menu of the **Design** mode includes the following actions:

 **Go to Definition (Ctrl + Shift + Enter)**

Shows the definition for the currently selected component. For references, this action is available by clicking the arrow displayed in its bottom right corner.

 **Open Schema (Ctrl + Shift + Enter)**

Opens the selected schema. This action is available for `<xsd:import>`, `<xsd:include>` and `<xsd:redefine>` elements. If the file you try to open does not exist, a warning message is displayed and you have the possibility to create the file.

 **Edit Attributes ()**

Allows you to edit the attributes of the selected component in a small in-place editor that presents the same attributes as in the **Attributes** view *(on page 1008)* and the **Facets** view *(on page 964)*. The actions that can be performed on attributes in this dialog box are the same actions presented in the two views.

Append child

Offers a list of valid components, depending on the context, and appends your selection as a child of the currently selected component. You can set a name for a named component after it has been added in the diagram.

Insert before

Offers a list of valid components, depending on the context, and inserts your selection before the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

Insert after

Offers a list of valid components, depending on the context, and inserts your selection after the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

New global

Inserts a global component in the schema diagram. This action does not depend on the current context. If you choose to insert an import you have to specify the URL of the imported file, the target namespace and the import ID. The same information, excluding the target namespace, is requested for an `<xsd:include>` or `<xsd:redefine>` element.

Note:
If the imported file has declared a target namespace, the field **Namespace** is completed automatically.

Edit Schema Namespaces

When performed on the schema root, it allows you to edit the schema target namespace and namespace mappings. You can also invoke the action by double-clicking the target namespace property from **Attributes** view *(on page 1008)* for the schema or by double-clicking the schema component.

Edit Annotations

Allows you to edit the annotation for the selected schema component in the **Edit Annotations** dialog box. You can perform the following operations in the dialog box:

- **Edit all `appinfo/documentation` items for a specific annotation** - All `appinfo/documentation` items for a specific annotation are presented in a table and can be easily edited. Information about an annotation item includes: type (`documentation/appinfo`), content, source (optional, specify the source of the `documentation/appinfo` element) and `xml:lang`.

The content of a `documentation/appinfo` item can be edited in the **Content** area below the table.

- **Insert/Insert before/Remove** `documentation/appinfo` - The **Add** button allows you to insert a new annotation item (`documentation/appinfo`). You can add a new item before the item selected in table by pressing the **Insert Before** button. Also, you can delete the selected item using the **Remove** button.
- **Move items up/down** - Do this by using the **Move up** and **Move down** buttons.
- **Insert/Insert before/Remove annotation** - Available for components that allow multiple annotations such as schemas or redefines.
- **Specify an ID for the component annotation** - An optional identifier for the annotation.

Annotations are rendered by default under the graphical representation of the component. When you have a reference to a component with annotations, these annotations are also presented in the diagram below the referenced component. To edit the annotations, use the **Edit Annotations** action from the contextual menu. If the reference component does not have annotations, you can edit the annotations of the referenced component by double-clicking the annotations area. Otherwise, you can edit the referenced component annotations only if you go to the definition of the component.

Note:
For imported/included components that do not belong to the currently edited schema, the **Edit Annotations** dialog box presents the annotation as read-only. To edit its annotation, open the schema where the component is defined.

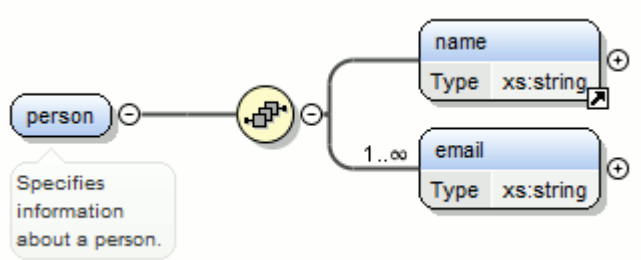
Change XML Schema Version

Use this action to change the XML Schema version of the current document.

Extract Global Element

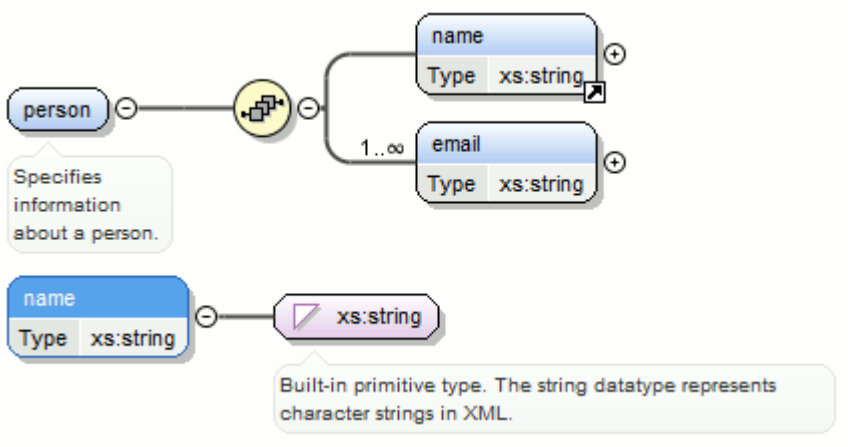
This action is available for local elements. A local element is made global and is replaced with a reference to the global element. The local element properties that are also valid for the global element declaration are kept.

Figure 292. Extracting a Global Element



If you use the **Extract Global Element** action on a `<name>` element, the result is:

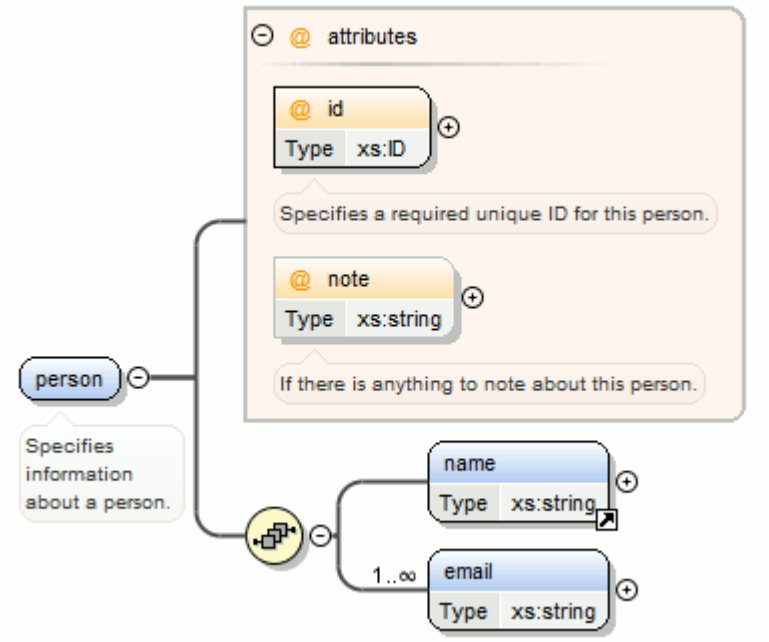
Figure 293. Extracting a Global Element on a `<name>` Element



Extract Global Attribute

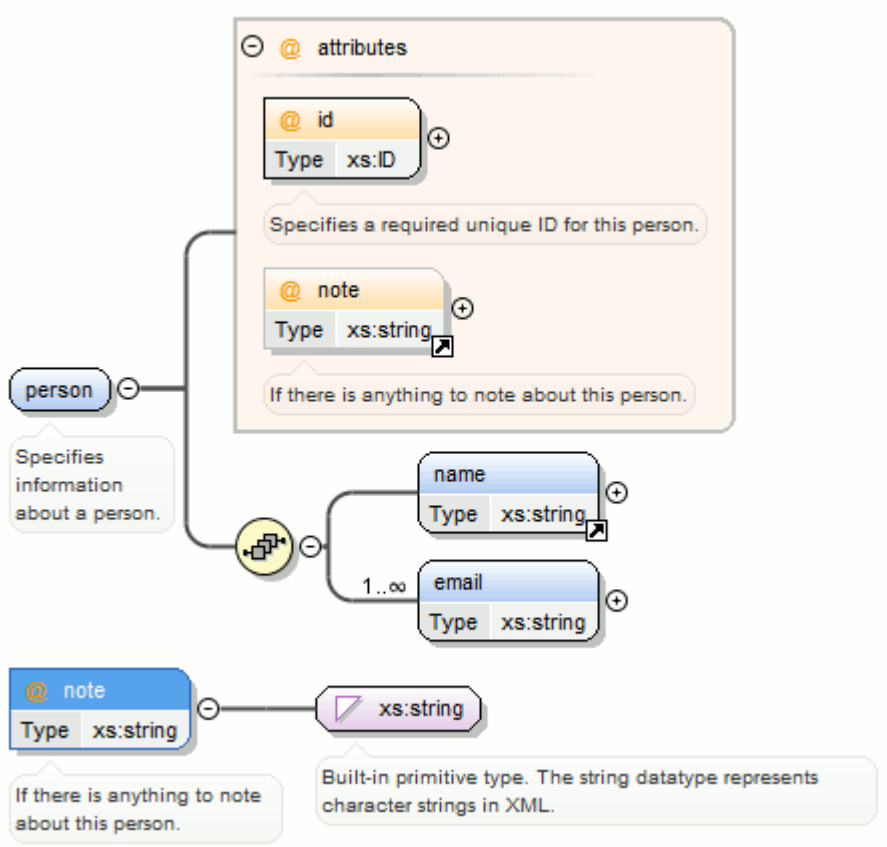
This action is available for local attributes. A local attribute is made global and replaced with a reference to the global attribute. The properties of local attribute that are also valid in the global attribute declaration are kept.

Figure 294. Extracting a Global Attribute



If you use the **Extract Global Attribute** action on a `@note` attribute, the result is:

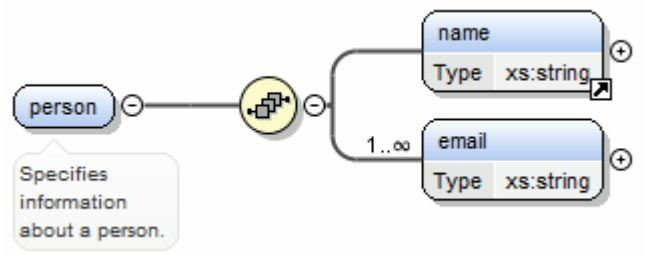
Figure 295. Extracting a Global Attribute on a `@note` Attribute



Extract Global Group

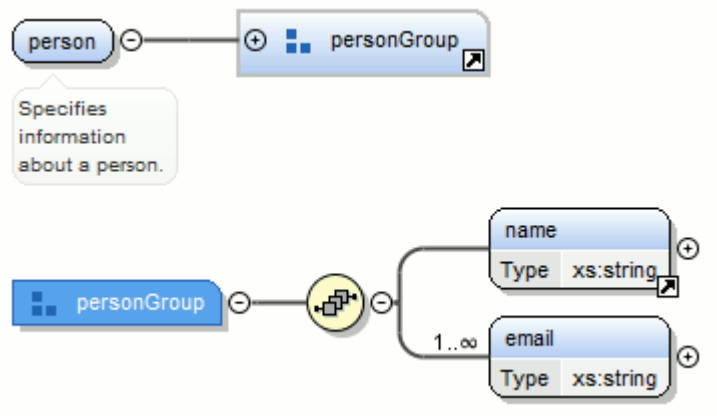
This action is available for compositors (sequence, choice, all). This action extracts a global group and makes a reference to it. The action is available only if the parent of the compositor is not a group.

Figure 296. Extracting a Global Group



If you use the **Extract Global Group** action on the `<sequence>` element, the **Extract Global Component** dialog box is displayed and you can choose a name for the group. If you type `personGroup`, the result is:

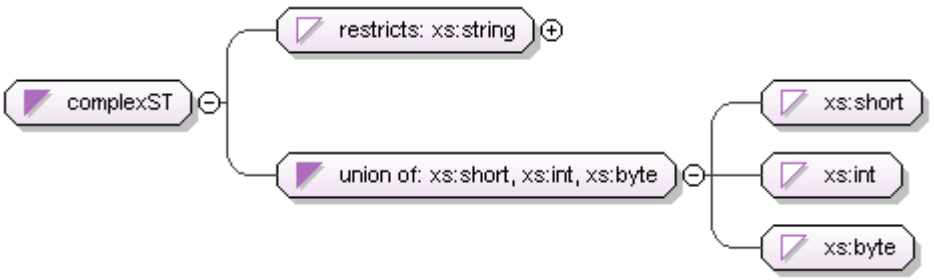
Figure 297. Extracting a Global Group on a `<sequence>` Element



Extract Global Type

This action is used to extract an anonymous simple type or an anonymous complex type as global. For anonymous complex types, the action is available on the parent element.

Figure 298. Extracting a Global Simple Type



If you use the action on the `union` component and choose `numericST` for the new global simple type name, the result is:

Figure 299. Extracting a Global Simple Type on a `union` Component

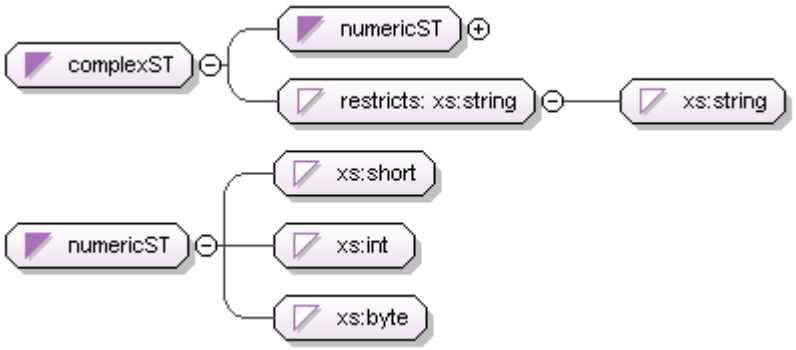


Figure 300. Extracting a Global Complex Type

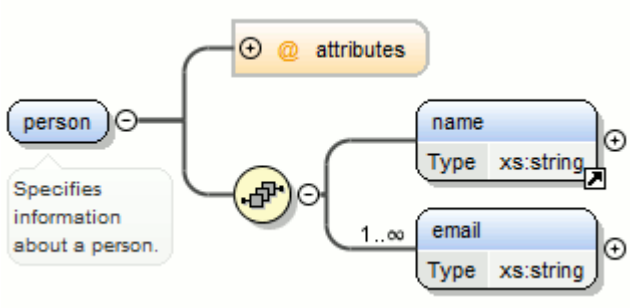
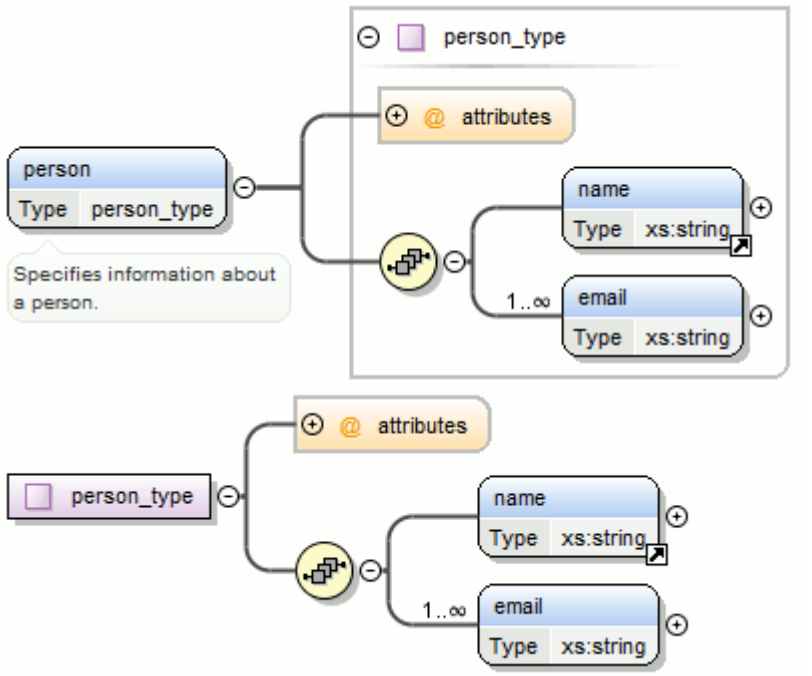


If you use the action on a `<person>` element and choose `person_type` for the new complex type name, the result is:

Figure 301. Extracting a Global Complex Type on a `<person>` Element



Rename Component in

Renames the selected component.

Cut Ctrl + X (Command + X on macOS)

Cuts the selected component(s).

Copy Ctrl + C (Command + C on macOS)

Copies the selected component(s) to the clipboard.

Copy XPath

This action copies an XPath expression that identifies the selected element or attribute in an instance XML document of the edited schema and places it in the clipboard.

Paste Ctrl + V (Command + V on macOS)

Pastes the component(s) from the clipboard as children of the selected component.

Paste as Reference

Creates references to the copied component(s). If not possible, a warning message is displayed.

Remove Delete

Removes the selected component(s).

Override component

Copies the overridden component in the current XML Schema. This option is available for `xs:override` components.

Redefine component

The referenced component is added in the current XML Schema. This option is available for `xs:redefine` components.

Optional

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The `minOccurs` property is set to 0 and the `use` property for attributes is set to `optional`.

Unbounded

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The `maxOccurs` property is set to `unbounded` and the `use` property for attributes is set to `required`.

Search

Can be performed on local elements or attributes. This action makes a reference to a global element or attribute.

 **Search References**

Searches all references of the item found at current cursor position in the defined scope if any.

Search References in

Searches all references of the item found at current cursor position in the specified scope.

Search Occurrences in File

Searches all occurrences of the item found at current cursor position in the current file.

 **Component Dependencies**

Opens the **Component Dependencies** view *(on page 1013)* that allows you to see the dependencies for the currently selected component.

Show referenced resources

Opens the **Referenced/Dependent Resources** view *(on page 1010)* that allows you to see the references for the currently selected resource.

Show dependent resources

Allows you to see the dependencies for the currently selected resource.

Expand All

Recursively expands all sub-components of the selected component.

Collapse All

Recursively collapses all sub-components of the selected component.

Save as Image

Saves the diagram as image, in JPEG, BMP, SVG or PNG format.

Generate Sample XML Files

Generates XML files using the current opened schema. The selected component is the XML document root. See more in the Generate Sample XML Files *(on page 1019)* section.

Flatten Schema

Recursively adds the components of included Schema files to the main one. It also flattens every imported XML Schema from the hierarchy.

Options

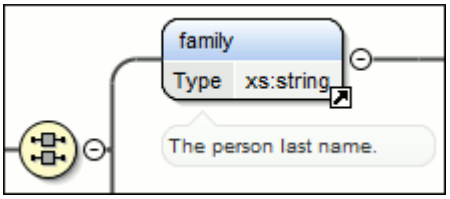
Opens the Schema preferences page *(on page 206)*.

XML Schema Components

A schema diagram contains a series of interconnected components. To quickly identify the relation between two connected components, the connection is represented as:

- A thick line to identify a connection with a required component (in the following image, `<family>` is a required element).

Figure 302. Example: Required Component



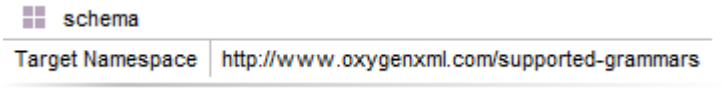
- A thin line to identify a connection with an optional component (in the following image, `<email>` is an optional element).

Figure 303. Example: Optional Component

The topics in this section provide details about all of the available components and their symbols as they appear in an XML schema diagram.

xs:schema

Figure 304. The *xs:schema* Component



Defines the root element of a schema. A schema document contains representations for a collection of schema components, such as type definitions and element declarations, that have a common target namespace. See more info at http://www.w3.org/TR/xmlschema11-1/#element-schema.

By default, it displays the *targetNamespace* property when rendered.

Table 10. *xs:schema* Properties

Property Name	Description	Possible Values
Target Namespace	The schema target namespace	Any URI
Element Form Default	Determining whether or not local element declarations will be namespace-qualified by default	qualified, unqualified, [Empty] (default value is unqualified)
Attribute Form Default	Determining whether or not local attribute declarations will be namespace-qualified by default	qualified, unqualified, [Empty] (default value is unqualified)
Block Default	Default value of the *block* attribute of *xs:element* and *xs:complexType*	#all, extension, restriction, substitution, restriction extension, restriction substitution, extension substitution, restriction extension substitution, [Empty]
Final Default	Default value of the *final* attribute of *xs:element* and *xs:complexType*	#all, restriction, extension, restriction extension, [Empty]
Default Attributes	Specifies a set of attributes that apply to every complex Type in a schema document	Any
XPath Default Namespace	The default namespace used when the XPath expression is evaluated	##defaultNamespace, ##targetNamespace, ##local
Version	Schema version	Any token

Table 10. *xs:schema* Properties (continued)

Property Name	Description	Possible Values
ID	The schema ID	Any ID
Component	The edited component name	Not editable property
SystemID	The schema system ID	Not editable property

xs:element

Figure 305. The *xs:element* Component

Defines an element. An element declaration is an association of a name with a type definition, either simple or complex, an (optional) default value and a (possibly empty) set of identity-constraint definitions. See more info at http://www.w3.org/TR/xmlschema11-1/#element-element.

An element by default displays the following properties when rendered in the diagram: *default*, *fixed*, *abstract* and *type*. When referenced or declared locally, the element graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the element are drawn using dotted lines if the element is optional.

Table 11. *xs:element* Properties

Property Name	Description	Possible Values	Mentions
Name	The element name (always required)	Any NCName for global or local elements, any *QName (on page 3423)* for element references	If missing, will be displayed as '[element]' in diagram
Is Reference	When set, the local element is a reference to a global element	true/false	Appears only for local elements
Type	The element type	All declared or built-in types. In addition, the fol-	For all elements.

Table 11. *xs:element* Properties (continued)

Property Name	Description	Possible Values	Mentions
		lowing anonymous types are available: [ST-restriction], [ST-union], [ST-list], [CT-anonymous], [CT-extension SC], [CT-restriction SC], [CT-restriction CC], [CT-extension CC].	For references, the value is set in the referenced element.
Base Type	The extended/restricted base type	All declared or built-in types	For elements with complex type, with simple or complex content
Mixed	Defines if the complex type content model will be mixed	true/false	For elements with complex type
Content	The content of the complex type	simple/complex	For elements with complex type that extends/restricts a base type. It is automatically detected
Content Mixed	Defines if the complex content model will be mixed	true/false	For elements with complex type that has a complex content

Table 11. *xs:element* Properties (continued)

Property Name	Description	Possible Values	Mentions
Default	Default value of the element. A default value is automatically assigned to the element when no other value is specified	Any string	The fixed and default attributes are mutually exclusive
Fixed	A simple content element may be fixed to a specific value using this attribute. A fixed value is also automatically assigned to the element and you cannot specify another value.	Any string	The fixed and default attributes are mutually exclusive
Min Occurs	Minimum number of occurrences of the element	A numeric positive value. Default value is 1	Only for references/local elements
Max Occurs	Maximum number of occurrences of the element	A numeric positive value (default value is 1)	Only for references/local elements
Substitution Group	Qualified name of the head of the substitution group that this element belongs to	All declared elements. For XML Schema 1.1 this property supports multiple values.	For global and reference elements
Abstract	Controls whether or not the element may be used directly in instance XML documents. When set to true, the element may still be used to define content models, but it must be substituted through a substitution group in the instance document.	true/false	For global elements and element references
Form	Defines if the element is "qualified" (belongs to the target namespace) or "unqualified" (doesn't belong to any namespace)	unqualified/qualified	Only for local elements

Table 11. *xs:element* Properties (continued)

Property Name	Description	Possible Values	Mentions
Nillable	When this attribute is set to true, the element can be declared as nil using an *xsi:nil* attribute in the instance documents	true/false	For global elements and element references
Target Namespace	Specifies the target namespace for local element and attribute declarations. The namespace URI may be different from the schema target namespace. This property is available for local elements only.	Not editable property	For all elements
Block	Controls if the element can be subject to a type or substitution group substitution. '#all' blocks any substitution, 'substitution' blocks any substitution through substitution groups and 'extension'/'restriction' block any substitution (both through *xsi:type* and substitution groups) by elements or types, derived respectively by extension or restriction from the type of the element. Its default value is defined by the *blockDefault* attribute of the parent *xs:schema*.	#all, restriction, extension,substitution, extension restriction, extension substitution, restriction substitution, restriction extension substitution	For global elements and element references
Final	Controls whether the element can be used as the head of a substitution group for elements whose types are derived by extension or restriction from the type of the element. Its default value is defined by the *finalDefault* attribute of the parent *xs:schema*.	#all, restriction, extension, restriction extension, [Empty]	For global elements and element references
ID	The component ID	Any ID	For all elements
Component	The edited component name	Not editable property	For all elements
Namespace	The component namespace	Not editable property	For all elements
System ID	The component system ID	Not editable property	For all elements

xs:attribute

Figure 306. The *xs:attribute* Component

Defines an attribute. See more info at http://www.w3.org/TR/xmlschema11-1/#element-attribute.

An attribute by default displays the following properties when rendered in the diagram: *default*, *fixed*, *use* and *type*. Connectors to the attribute are drawn using dotted lines if the attribute use is optional. The attribute name is stroked out if prohibited.

Table 12. *xs:attribute* Properties

Property Name	Description	Possible Value	Mentions
Name	Attribute name (always required)	Any NCName for global/local attributes, all declared attributes' *QName (on page 3423)* for references	For all local or global attributes. If missing, will be displayed as '[attribute]' in the diagram.
Is Reference	When set, the local attribute is a reference	true/false	For local attributes
Type	Qualified name of a simple type	All global simple types and built-in simple types. In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for creating anonymous simple types more easily.	For all attributes. For references, the type is set to the referenced attribute.
Default	Default value. When specified, an attribute is added by the schema processor (if it is missing from the instance XML document) and it is given this value. The default and fixed attributes are mutually exclusive.	Any string	For all local or global attributes. For references the value is from the referenced attribute.

Table 12. *xs:attribute* Properties (continued)

Property Name	Description	Possible Value	Mentions
Fixed	When specified, the value of the attribute is fixed and must be equal to this value. The default and fixed attributes are mutually exclusive.	Any string	For all local or global attributes. For references the value is from the referenced attribute.
Use	Possible usage of the attribute. Marking an attribute "prohibited" is useful to exclude attributes during derivations by restriction.	optional, required, prohibited	For local attributes
Form	Specifies whether or not the attribute is qualified (must have a namespace prefix in the instance XML document). The default value for this attribute is specified by the *attributeFormDefault* attribute of the *xs:schema* document element.	unqualified/qualified	For local attributes
Inheritable	Specifies if the attribute is inheritable. Inheritable attributes can be used by <alternative> element on descendant elements	true/false	For all local or global attributes. The default value is false. This property is available for XML Schema 1.1.
Target Namespace	Specifies the target namespace for local attribute declarations. The namespace URI may be different from the schema target namespace.	Any URI	Setting a target namespace for local attribute is useful only when restricts attributes of a complex type that is declared in other schema with a different target namespace. This property is available for XML Schema 1.1.
ID	The component ID	Any ID	For all attributes
Component	The edited component name	Not editable property	For all attributes
Namespace	The component namespace	Not editable property	For all attributes

Table 12. *xs:attribute* Properties (continued)

Property Name	Description	Possible Value	Mentions
System ID	The component system ID	Not editable property	For all attributes

xs:attributeGroup

Figure 307. The *xs:attributeGroup* Component

Defines an attribute group to be used in complex type definitions. See more info at http://www.w3.org/TR/xmlschema11-1/#element-attributeGroup.

Table 13. *xs:attributeGroup* Properties

Property Name	Description	Possible Values	Mentions
Name	Attribute group name (always required)	Any NCName for global attribute groups, all declared attribute groups for reference	For all global or referenced attribute groups. If missing, will be displayed as '[attributeGroup]' in diagram.
ID	The component ID	Any ID	For all attribute groups
Component	The edited component name	Not editable property	For all attribute groups
Namespace	The component namespace	Not editable property	For all attribute groups
System ID	The component system ID	Not editable property	For all attribute groups

xs:complexType

Figure 308. The *xs:complexType* Component

Defines a top-level complex type. Complex Type Definitions provide for: See more data at http://www.w3.org/TR/xmlschema11-1/#element-complexType.

- Constraining element information items by providing Attribute Declarations governing the appearance and content of attributes.
- Constraining element information item children to be empty, or to conform to a specified element-only or mixed content model, or else constraining the character information item children to conform to a specified simple type definition.
- Using the mechanisms of Type Definition Hierarchy to derive a complex type from another simple or complex type.
- Specifying post-schema-validation infoset contributions for elements.
- Limiting the ability to derive additional types from a given complex type.
- Controlling the permission to substitute, in an instance, elements of a derived type for elements declared in a content model to be of a given complex type.

Tip:
A complex type that is a base type to another type will be rendered with yellow background.

Table 14. *xs:complexType* Properties

Property Name	Description	Possible Values	Mentions
Name	The name of the complex type (always required)	Any NCName	Only for global complex types. If missing, will be displayed as '[complexType]' in diagram.
Base Type Definition	The name of the extended/restricted types	Any from the declared simple or complex types	For complex types with simple or complex content
Derivation Method	The derivation method	restriction/ extension	Only when base type is set. If the base type is a simple type, the derivation method

Table 14. *xs:complexType* Properties (continued)

Property Name	Description	Possible Values	Mentions
			is always extension.
Content	The content of the complex type	simple/ complex	For complex types that extend/restrict a base type. It is automatically detected.
Content Mixed	Specifies if the complex content model will be mixed	true/ false	For complex contents
Mixed	Specifies if the complex type content model will be mixed	true/ false	For global and anonymous complex types
Abstract	When set to *true*, this complex type cannot be used directly in the instance documents and needs to be substituted using an *xsi:type* attribute	true/ false	For global and anonymous complex types
Block	Controls if a substitution (either through a *xsi:type* or substitution groups) can be performed for a complex type, which is an extension or a restriction of the current complex type. This attribute can only block such substitutions (it cannot "unblock" them), which can also be blocked in the element definition. The default value is defined by the *blockDefault* attribute of *xs:schema*.	all, extension, restriction, extension restriction, [Empty]	For global complex types
Final	Controls whether the complex type can be further derived by extension or restriction to create new complex types	all, extension, restriction, extension restriction, [Empty]	For global complex types

Table 14. *xs:complexType* Properties (continued)

Property Name	Description	Possible Values	Mentions
Default Attributes Apply	The *schema* element can carry a *defaultAttributes* attribute, which identifies an attribute group. Each *complexType* defined in the schema document then automatically includes that attribute group, unless this is overridden by the *defaultAttributesApply* attribute on the *complexType* element.	true/ false	This property is available only for XML Schema 1.1
ID	The component ID	Any ID	For all complex types
Component	The edited component name	Not editable property	For all complex types
Namespace	The component namespace	Not editable property	For all complex types
System ID	The component system ID	Not editable property	For all complex types

xs:simpleType

Figure 309. The *xs:simpleType* Component

Defines a simple type. A simple type definition is a set of constraints on strings and information about the values they encode, applicable to the normalized value of an attribute information item or of an element information item with no element children. Informally, it applies to the values of attributes and the text-only content of elements. See more info at http://www.w3.org/TR/xmlschema11-1/#element-simpleType.

Tip:
A simple type that is a base type to another type will be rendered with yellow background.

Table 15. *xs:simpleType* Properties

Name	Description	Possible Values	Scope
Name	Simple type name. Always required.	Any NCName	Only for global simple types. If missing, will be displayed as '[simpleType]' in diagram.
Derivation	A simple type category	restriction, list, or union	For all simple types
Base Type	A simple type definition component. Required if derivation method is set to restriction.	All global simple types and built-in simple types. In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for easily create anonymous simple types.	For global and anonymous simple types with the derivation method set to restriction
Item Type	A simple type definition component. Required if derivation method is set to list.	All global simple types and built-in simple types(from schema for schema). In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for easily create anonymous simple types.	For global and anonymous simple types with the derivation method set to list. Derivation by list is the process of transforming a simple datatype (named the item type) into a whitespace-separated list of values from this datatype. The item type can be defined inline by adding a simpleType definition as a child element of the list element, or by reference, using the itemType attribute (it is an error to use both).
Member Types	Category for grouping union members	Not editable property	For global and anonymous simple types with the derivation method set to union
Member	A simple type definition component. Re-	All global simple types and built-in simple types(from schema for schema). In addition another 3 proposals are present: [anonymous re-	For global and anonymous simple types with the derivation method set to union. Deriving a simple datatype by union merges the lexical spaces of several simple datatypes (called member types) to create a new simple datatype. The member types can be defined either by ref-

Table 15. *xs:simpleType* Properties (continued)

Name	Description	Possible Values	Scope
	quired if derivation method is set to union.	striction], [anonymous list], [anonymous union] for easily create anonymous simple types.	erence (through the memberTypes attribute) or embedded as simple datatype local definitions in the xs:union element. Both styles can be mixed.
Final	Blocks any further derivations of this datatype (by list, union, derivation or all)	#all, list, restriction, union, list restriction, list union, restriction union. In addition, [Empty] proposal is present for set empty string as value.	Only for global simple types
ID	The component ID	Any ID	For all simple types
Component	The name of the edited component	Not editable property	Only for global and local simple types
Namespace	The component namespace	Not editable property	For global simple types
System ID	The component system ID	Not editable property	Not present for built-in simple types

xs:alternative

The *type alternatives* mechanism allows you to specify type substitutions on an element declaration.

Note:
xs:alternative is available for XML Schema 1.1.

Figure 310. The *xs:alternative* Component

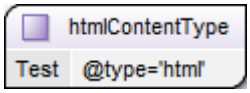


Table 16. *xs:alternative* Properties

Name	Description	Possible Values
Type	Specifies type substitutions for an element, depending on the value of the attributes	All declared or built-in types. In addition, the following anonymous types are available: [ST-restriction], [ST-union], [ST-list], [CT-anonymous], [CT-extension SC], [CT-restriction SC], [CT-restriction CC], [CT-extension CC]
Test	Specifies an XPath expression. If the XPath condition is valid, the specified type is selected as the element type. The expressions allowed are limited to a subset of XPath 2.0. Only the attributes of the current element and inheritable attributes from ancestor elements are accessible in the XPath expression. When you edit this property, the content completion list of proposals offers XPath expressions.	An XPath expression
XPath Default Namespace	The default namespace used when the XPath expression is evaluated	##defaultNamespace, ##targetNamespace, ##local
ID	Specifies the component ID	Any ID
Component	Specifies the type of XML schema component	Not editable property
System ID	Points to the document location of the schema	Not editable property

xs:group

Figure 311. The *xs:group* Component

Defines a group of elements to be used in complex type definitions. See more info at http://www.w3.org/TR/xmlschema11-1/#element-group.

When referenced, the graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the group are drawn using dotted lines if the group is optional.

Table 17. *xs:group* Properties

Property Name	Description	Possible Values	Mentions
Name	The group name (always required)	Any NCName for global groups, all declared groups for reference	If missing, will be displayed as '[group]' in diagram
Min Occurs	Minimum number of occurrences of the group	A numeric positive value. Default value is 1	Appears only for reference groups
Max Occurs	Maximum number of occurrences of the group	A numeric positive value. Default value is 1	Appears only for reference groups
ID	The component ID	Any ID	For all groups
Component	The edited component name	Not editable property	For all groups
Namespace	The component namespace	Not editable property	For all groups
System ID	The component system ID	Not editable property	For all groups

xs:include

Figure 312. The *xs:include* Component

Adds multiple schemas with the same target namespace to a document. See more info at http://www.w3.org/TR/xmlschema11-1/#element-include.

Table 18. *xs:include* properties

Property Name	Description	Possible Values
Schema Location	Included schema location	Any URI
ID	Include ID	Any ID
Component	The component name	Not editable property

xs:import

Figure 313. The *xs:import* Component

Adds multiple schemas with a different target namespace to a document. See more info at http://www.w3.org/TR/xmlschema11-1/#element-import.

Table 19. *xs:import* Properties

Property Name	Description	Possible Values
Schema Location	Imported schema location	Any URI
Namespace	Imported schema namespace	Any URI
ID	Import ID	Any ID
Component	The component name	Not editable property

xs:redefine

Figure 314. The *xs:redefine* Component

Redefines simple and complex types, groups, and attribute groups from an external schema. See more info at http://www.w3.org/TR/xmlschema11-1/#element-redefine.

Table 20. *xs:redefine* Properties

Property Name	Description	Possible Values
Schema Location	Redefine schema location	Any URI
ID	Redefine ID	Any ID
Component	The component name	Not editable property

xs:override

Figure 315. The *xs:override* Component

The override construct allows replacements of old components with new ones without any constraint. See more info at http://www.w3.org/TR/xmlschema11-1/#element-override.

Table 21. *xs:override* Properties

Property Name	Description	Possible Values
Schema Location	Redefine schema location	Any URI
ID	Redefine ID	Any ID

xs:notation

Figure 316. The *xs:notation* Component

Describes the format of non-XML data within an XML document. See more info at http://www.w3.org/TR/xmlschema11-1/#element-notation.

Table 22. *xs:notation* Properties

Property Name	Description	Possible values	Mentions
Name	The notation name (always required)	Any NCName	If missing, will be displayed as '[notation]' in diagram
System Identifier	The notation system identifier	Any URI	Required if public identifier is absent (otherwise, optional)
Public Identifier	The notation public identifier	A Public ID value	Required if system identifier is absent (otherwise, optional)
ID	The component ID	Any ID	For all notations
Component	The edited component name	Not editable property	For all notations
Namespace	The component namespace	Not editable property	For all notations
System ID	The component system ID	Not editable property	For all notations

xs:sequence / xs:choice / xs:all

Figure 317. *xs:sequence*

xs:sequence specifies that the child elements must appear in a sequence. Each child element occurs once by default. See more info at http://www.w3.org/TR/xmlschema11-1/#element-sequence.

Figure 318. *xs:choice*

xs:choice allows only one of the elements contained in the declaration to be present within the containing element. See more info at http://www.w3.org/TR/xmlschema11-1/#element-choice.

Figure 319. *xs:all*

xs:all specifies that the child elements can appear in any order. See more info at http://www.w3.org/TR/xmlschema11-1/#element-all.

The compositor graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the compositor are drawn using dotted lines if the compositor is optional.

Table 23. *xs:sequence*, *xs:choice*, *xs:all* Properties

Property Name	Description	Possible Values	Mentions
Compositor	Compositor type	sequence, choice, all	'all' is only available as a child of a group or complex type
Min Occurs	Minimum occurrences of compositor	A numeric positive value. Default is 1	The property is not present if compositor is 'all' and is child of a group
Max Occurs	Maximum occurrences of compositor	A numeric positive value. Default is 1	The property is not present if compositor is 'all' and is child of a group
ID	The component ID	Any ID	For all compositors
Component	The edited component name	Not editable property	For all compositors
System ID	The component system ID	Not editable property	For all compositors

xs:any

Figure 320. The *xs:any* Component

Enables the author to extend the XML document with elements not specified by the schema. See more info at http://www.w3.org/TR/xmlschema11-1/#element-any.

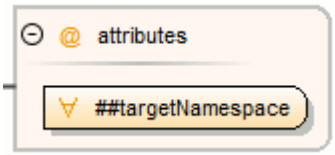
The graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the wildcard are drawn using dotted lines if the wildcard is optional.

Table 24. *xs:any* Properties

Property Name	Description	Possible Values
Namespace	The list of allowed namespaces. The namespace attribute expects a list of namespace URIs. In this list, two values have a specific meaning: '##targetNamespace' stands for the target namespace, and '##local' stands for local attributes (without namespaces).	##any, ##other, ##targetNamespace, ##local or anyURI
notNamespace	Specifies the namespace that extension elements or attributes cannot come from	##local, ##targetNamespace
notQName	Specifies an element or attribute that is not allowed	##defined
Process Contents	Type of validation required on the elements allowed for this wildcard	skip, lax, strict
Min Occurs	Minimum occurrences of any	A numeric positive value. Default is 1
Max Occurs	Maximum occurrences of any	A numeric positive value. Default is 1
ID	The component ID	Any ID
Component	The name of the edited component	Not editable property
System ID	The component system ID	Not editable property

xs:anyAttribute

Figure 321. The *xs:anyAttribute* Component



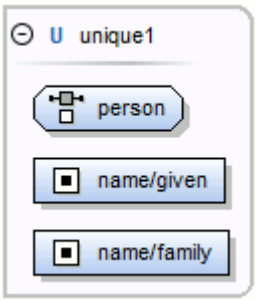
Enables the author to extend the XML document with attributes not specified by the schema. See more info at http://www.w3.org/TR/xmlschema11-1/#element-anyAttribute.

Table 25. *xs:anyAttribute* Properties

Property Name	Description	Possible Value
Namespace	The list of allowed namespaces. The namespace attribute expects a list of namespace URIs. In this list, two values have a specific meaning: '##targetNamespace' stands for the target namespace, and '##local' stands for local attributes (without namespaces).	##any, ##other, ##targetNamespace, ##local or anyURI
Process Contents	Type of validation required on the elements allowed for this wildcard	skip, lax, strict
ID	The component ID	Any ID
Component	The name of the edited component	Not editable property
System ID	The component system ID	Not editable property

xs:unique

Figure 322. The *xs:unique* Component



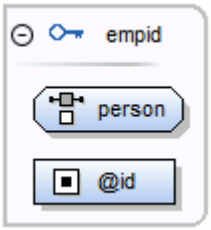
Defines that an element or an attribute value must be unique within the scope. See more info at http://www.w3.org/TR/xmlschema11-1/#element-unique.

Table 26. *xs:unique* Properties

Property Name	Description	Possible Values
Name	The unique name (always required)	Any NCName
ID	The component ID	Any ID
Component	The edited component name	Not editable property
Namespace	The component namespace	Not editable property
System ID	The component system ID	Not editable property

xs:key

Figure 323. The *xs:key* Component



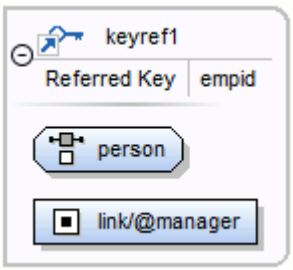
Specifies an attribute or element value as a key (unique, non-nullable and always present) within the containing element in an instance document. See more info at http://www.w3.org/TR/xmlschema11-1/#element-key.

Table 27. *xs:key* Properties

Property Name	Description	Possible Value
Name	The key name (always required)	Any NCName
ID	The component ID	Any ID
Component	The edited component name	Not editable property
Namespace	The component namespace	Not editable property
System ID	The component system ID	Not editable property

xs:keyRef

Figure 324. The *xs:keyRef* Component



Specifies that an attribute or element value corresponds to that of the specified key or unique element. See more info at http://www.w3.org/TR/xmlschema11-1/#element-keyref.

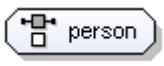
A keyref by default displays the *Referenced Key* property when rendered.

Table 28. *xs:keyRef* Properties

Property Name	Description	Possible Values
Name	The keyref name (always required)	Any NCName
Referenced Key	The name of referenced key	Any declared element constraints
ID	The component ID	Any ID
Component	The edited component name	Not editable property
Namespace	The component namespace	Not editable property
System ID	The component system ID	Not editable property

xs:selector

Figure 325. The *xs:selector* Component



Specifies an XPath expression that selects a set of elements for an identity constraint. See more info at http://www.w3.org/TR/xmlschema11-1/#element-selector.

Table 29. *xs:selector* Properties

Property Name	Description	Possible Values
XPath	Relative XPath expression identifying the element that the constraint applies to	An XPath expression
ID	The component ID	Any ID

Table 29. *xs:selector* Properties (continued)

Property Name	Description	Possible Values
Component	The edited component name	Not editable property
System ID	The component system ID	Not editable property

xs:field

Figure 326. The *xs:field* Component

Specifies an XPath expression that specifies the value used to define an identity constraint. See more info at http://www.w3.org/TR/xmlschema11-1/#element-field.

Table 30. *xs:field* Properties

Property Name	Description	Possible Values
XPath	Relative XPath expression identifying the field(s) composing the key, key reference, or unique constraint	An XPath expression
ID	The component ID	Any ID
Component	The edited component name	Not editable property
System ID	The component system ID	Not editable property

xs:assert

Assertions provide a flexible way to control the occurrence and values of elements and attributes available in an XML Schema.

Note:
xs:assert is available for XML Schema 1.1.

Figure 327. The *xs:assert* Component

Table 31. *xs:assert* Properties

Property Name	Description	Possible Values
Test	Specifies an XPath expression. If the XPath condition is valid, the specified type is selected as the element type. The expressions allowed are limited to a subset of XPath 2.0. Only the attributes of the current element and inheritable attributes from ancestor elements are accessible in the XPath expression. When you edit this property, the content completion list of proposals offers XPath expressions.	An XPath expression
XPath Default Namespace	The default namespace used when the XPath expression is evaluated	##default-Namespace, ##target-Namespace, ##local
ID	Specifies the component ID	Any ID
Component	The edited component name	Not editable property
System ID	The component system ID	Not editable property

xs:openContent

Figure 328. The *xs:openContent* Component

The *openContent* element enables instance documents to contain extension elements to be inserted amongst the elements declared by the schema. You can declare open content for your elements at one place (within the *complexType* definition) or at the schema level.

For further details about the *openContent* component, go to http://www.w3.org/TR/xmlschema11-1/#element-openContent.

Table 32. *xs:openContent* Properties

Property Name	Description	Possible Value
Mode	Specifies where the extension elements can be inserted	The value can be: "interleave", "suffix" or "none". The default value is "interleave".
ID	The component ID	Any ID
Component	The edited component name	Not editable property
System ID	The component system ID	Not editable property

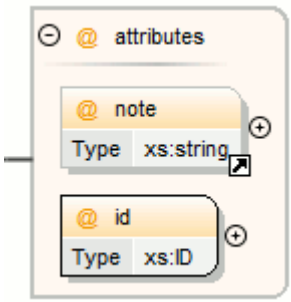
Note:
This component is available for XML Schema 1.1 only. To change the version of the XML Schema, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XML Parser > XML Schema**.

Constructs Used to Group Schema Components

This section explains the components that can be used for grouping other schema components.

Attributes

Figure 329. Attributes Construct



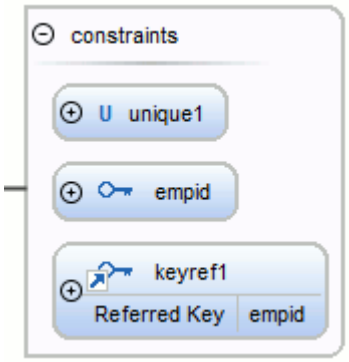
Groups all attributes and attribute groups belonging to a complex type.

Table 33. *attributes* Properties

Property Name	Description	Possible Values
Component	The element that has the attributes displayed	Not editable property
System ID	The component system ID	Not editable property

Constraints

Figure 330. Constraints Construct



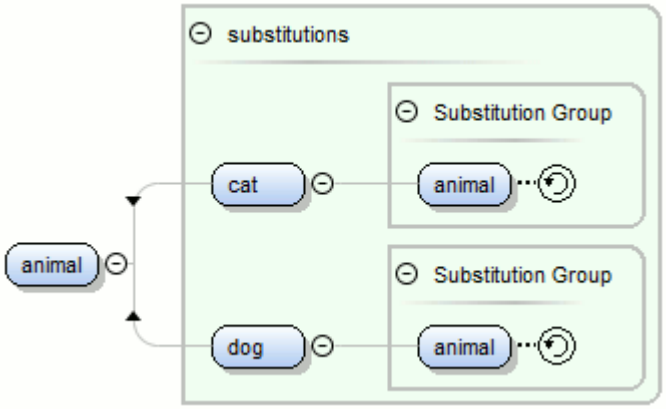
Groups all constraints (*xs:key (on page 995)*, *xs:keyRef (on page 996)*, or *xs:unique (on page 994)*) belonging to an element.

Table 34. *constraints* Properties

Property Name	Description	Possible Values
Component	The element that has the constraints displayed	Not editable property
System ID	The component system ID	Not editable property

Substitutions

Figure 331. Substitutions Construct



Groups all elements that can substitute the current element.

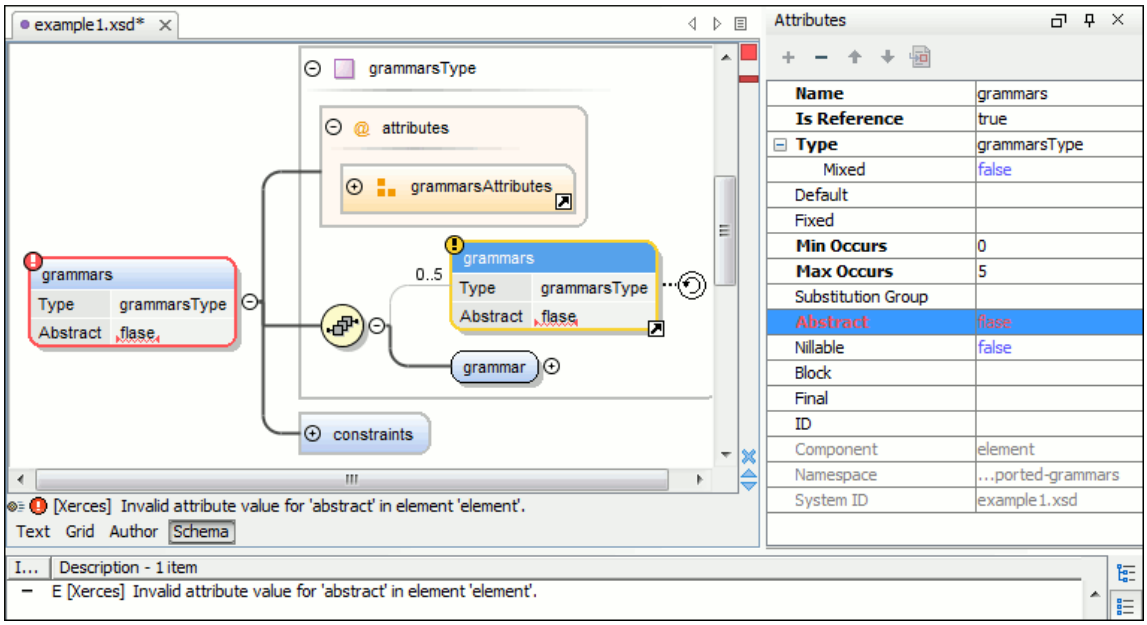
Table 35. *substitutions* Properties

Property Name	Description	Possible Values
Component	The element that has the substitutions displayed	Not editable property
System ID	The component system ID	Not editable property

Schema Validation

Validation for the **Design** mode is seamlessly integrated in the Oxygen XML Editor XML documents validation *(on page 784)* capability.

Figure 332. XML Schema Validation



A schema validation error is presented by highlighting the invalid component:

- In the Attributes View *(on page 1008)*.
- In the diagram by surrounding the component that has the error with a red border.
- A marker on the errors stripe at the right of the diagram view.
- A status label with a red icon ( ) below the diagram view.

Invalid facets for a component are highlighted in the Facets View *(on page 964)*.

Components with invalid properties are rendered with a red border. This is a default color, but you can customize it in the Document checking user preferences *(on page 235)*. When hovering an invalid component, the tooltip will present the validation errors associated with that component.

When editing a value that is supposed to be a qualified or unqualified XML name, the application provides automatic validation of the entered value. This proves to be very useful in avoiding setting invalid XML names for the given property.

If you validate the entire schema using the **Validate** action from the **Document > Validate** menu or from the **Validation** toolbar drop-down menu, all validation errors will be presented in the **Errors** tab. To resolve an error, just click it (or double-click for errors located in other schemas) and the corresponding schema component will be displayed as the diagram root so that you can easily correct the error.

Important:
If the schema imports only the namespace of other schema without specifying the schema location and a catalog is set up *(on page 838)* that maps the namespace to a certain location both the validation and the diagram will correctly identify the imported schema.

Tip:
If the validation action finds that the schema contains unresolved references, the application will suggest the use of validation scenarios, but only if the currently edited schema is an XML Schema module.

Edit Schema Namespaces

You can use the **XML Schema Namespaces** dialog box to easily set a target namespace and define namespace mappings for a newly created XML Schema. In the **Design** mode these namespaces can be modified anytime by choosing **Edit Schema Namespaces** from the contextual menu. You can also do this by double-clicking the schema root in the diagram.

The **XML Schema Namespaces** dialog box allows you to edit the following information:

- **Target namespace** - The target namespace of the schema.
- **Prefixes** - The dialog box displays a table with namespaces and the mapped prefixes. You can add a new prefix mapping or remove an already existing one.

Editing XML Schema in Text Editing Mode

The Oxygen XML Editor **Text** editing mode can be used for editing XML Schema in a source editing mode. It offers powerful content completion support, a synchronized Outline view, and multiple refactoring actions *(on page 1015)*. The Outline view has two display modes: the standard outline *(on page 549)* mode and the components *(on page 1006)* mode.

A diagram of the XML Schema can be presented side by side with the text. To activate the diagram presentation, select the *Show Full Model XML Schema diagram* option *(on page 181)* in the **Diagram** preferences page *(on page 180)*.

Modular Contextual XML Schema Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex XML Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main XML document either using the *main files* support from the **Project** view *(on page 428)*, or using a validation scenario.

To set a *main file* using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of a *main file (on page 3421)* include:

- Correct validation of a module in the context of a larger schema structure.
- *Content Completion Assistant (on page 3418)* displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.
- The **Outline** view *(on page 1006)* displays the components collected from the entire schema structure.

Validating XML Schema Documents

By default, XML Schema files are validated as you type. To change this, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option *(on page 235)*.

To validate an XML Schema document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu. When Oxygen XML Editor validates an XML Schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Some validation messages have an icon ( ) in the **Info** column in the Results view *(on page 558)* or at the bottom of the main editor and clicking it opens a dialog box with additional information and a link to the W3C specification exactly at the location where the error is described, thus allowing you to understand the reason for that error.

Validation of an XML Schema containing a type definition with a `@minOccurs` or `@maxOccurs` attribute having a value larger than 256 limits the value to 256 and issues a warning about this restriction in the Message panel at the bottom of the Oxygen XML Editor window. Otherwise, for large values of the `@minOccurs` and `@maxOccurs` attributes, the validator fails with an **OutOfMemory** error that might make Oxygen XML Editor unusable without restarting the entire application.

Important:
If the schema imports only a namespace without specifying the schema location and a catalog is set up *(on page 838)* to map the namespace to a certain location, both validation and the schema components will correctly identify the imported schema.

Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor offers *Quick Fixes (on page 3423)* for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

Note:
For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

Quick Fixes are available in **Text** mode and **Author** mode.

Oxygen XML Editor provides *Quick Fixes* for numerous types of problems, including the following:

Problem Type	Available Quick Fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

Ignoring/Unignoring Validation Problems *(on page 823)*

Content Completion in XML Schema

The intelligent *Content Completion Assistant (on page 3418)* allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Editor > Content Completion**, and deselect the **Enable content completion** option *(on page 219)*.

When active, the *Content Completion Assistant* displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the **Ctrl + Space** shortcut. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on macOS)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

Depending on the selected schema version *(on page 1045)*, Oxygen XML Editor populates the proposals list with information taken either from XML Schema 1.0 or 1.1.

Oxygen XML Editor helps you to easily reference a component by providing the list of proposals (complex types, simple types, elements, attributes, groups, attribute groups, or notations) valid in the current context. The components are collected from the current file or from the imported/included schemas.

When editing `<xs:annotation>` or `<xs:appinfo>` elements of an XML Schema, the *Content Completion Assistant* proposes elements and attributes from a custom schema (by default ISO Schematron). This feature can be configured from the XSD Content Completion *(on page 222)* preferences page.

Syntax Highlighting in XML Schema

Oxygen XML Editor supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XML Schema files, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*.
2. Go to **Editor > Syntax Highlight** *(on page 233)*.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XSD** tab in the **Preview** pane to see the effects of your changes.

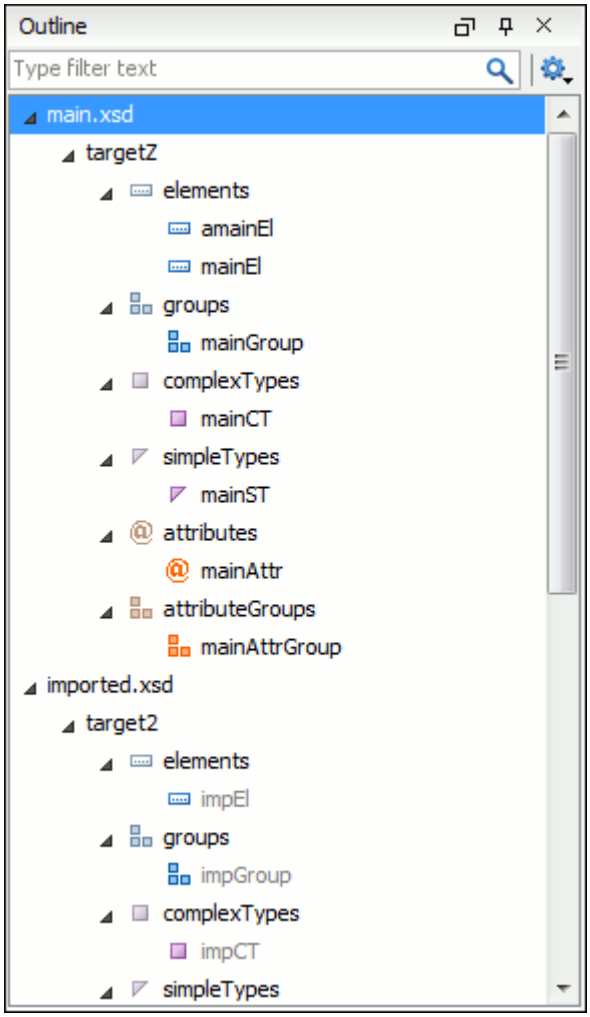
Tip:
Oxygen XML Editor also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page *(on page 234)*.

Related Information:
Customize Syntax Highlight colors *(on page 233)*

XML Schema Outline View

The **Outline** view for XML Schemas presents all the global components grouped by their location, namespace, or type. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 333. Outline View for XML Schema



The **Outline** view provides the following options in the **Settings** menu on the **Outline** view toolbar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches;

Selection update on cursor move

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram is also selected in the **Outline** view.

Sort

Allows you to sort alphabetically the schema components.

Show all components

Displays all components that were collected starting from the *main files (on page 3421)*. Components that are not referable from the current file are marked with an orange underline. To reference them, add an import directive with the `componentNS` namespace.

Show referable components

Displays all components (collected starting from the *main files (on page 3421)*) that can be referenced from the current file. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/namespace/type

These three operations allow you to group the components by location, namespace, or type. When grouping by namespace, the main schema target namespace is the first presented in the **Outline** view.

The following contextual menu actions are available in the **Outline** view:

Remove (Delete)

Removes the selected item from the diagram.

Search References (Ctrl + Shift + R (Meta + Shift + R on macOS))

Searches all references of the item found at current cursor position in the defined scope, if any.

Search References in

Searches all references of the item found at current cursor position in the specified scope.

Component Dependencies (Ctrl + Shift + F4 (Meta + Shift + F4 on macOS))

Opens the **Component Dependencies** view *(on page 1013)* that allows you to see the dependencies for the currently selected component.

Show referenced resources (F4)

Opens the **Referenced/Dependent Resources** view *(on page 844)* that allows you to see the references for the currently selected resource.

Show dependent resources (Shift + F4)

Opens the **Referenced/Dependent Resources** view *(on page 844)* that allows you to see the dependencies for the currently selected resource.

Rename Component in

Renames the selected component.

Generate Sample XML Files

Generate XML files using the currently open schema. The selected component is the XML document root.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*` or `?`) and separate multiple patterns with commas.

Tip:
The search filter is case insensitive. The following wildcards are accepted:

- ***** - any string
- **?** - any character
- **,** - patterns separator

If no wildcards are specified, the string to search will be searched as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

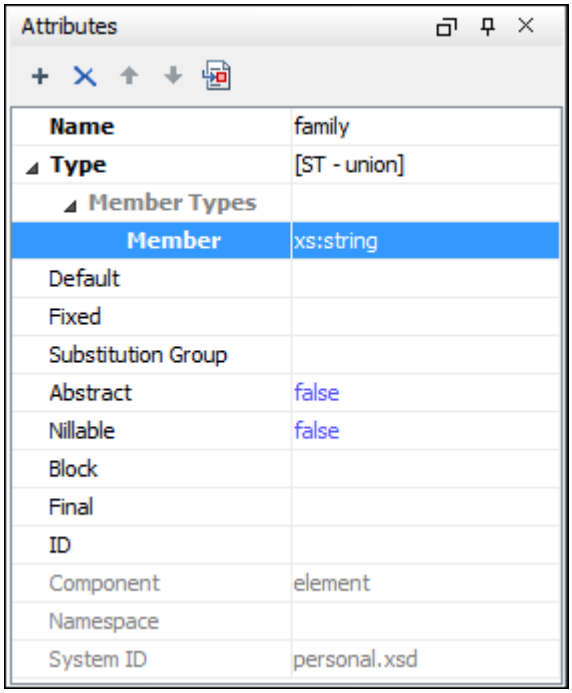
XML Schema Attributes View

The **Attributes** view for XML Schemas presents the properties for the selected component in the schema diagram. By default, it is displayed on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 334. Attributes View



The default value of a property is presented in the **Attributes** view with blue foreground. The properties that can not be edited are rendered with gray foreground. A non-editable category that contains at least one child is rendered with bold. Bold properties are properties with values set explicitly to them.

Properties for components that do not belong to the currently edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a property by double-clicking by pressing Enter. For most properties you can choose valid values from a list or you can specify another value. If a property has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, properties with errors are highlighted with red and the properties with warnings are highlighted with yellow. You can customize these colors from the Document checking user preferences *(on page 235)*.

For imports, includes and redefines, the properties are not edited directly in the **Attributes** view. A dialog box will open that allows you to specify properties for them.

The schema namespace mappings are not presented in **Attributes** view. You can view/edit these by choosing **Edit Schema Namespaces** from the contextual menu on the schema root. See more in the Edit Schema Namespaces *(on page 1002)* section.

The **Attributes** view has five actions available on the toolbar and also on the contextual menu:

Add

Allows you to add a new member type to an union's member types category.

Remove

Allows you to remove the value of a property.

Move Up

Allows you to move up the current member to an union's member types category.

Move Down

Allows you to move down the current member to an union's member types category.

Copy

Copy the attribute value.

Go to Definition

Shows the definition for the selected type.

Show Facets

Allows you to edit the facets for a simple type.

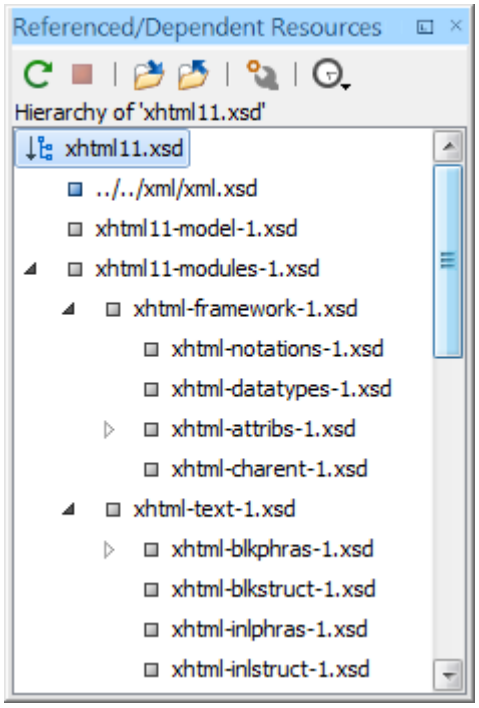
XML Schema Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for resources included in an XML Schema. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The **Referenced/Dependent Resources** is useful when you want to start from an XML Schema (XSD) file and build and review the hierarchy of all the other XSD files that are imported, included or redefined in the given XSD file. The view is also able to build the tree structure, that is the structure of all other XSD files that import, include or redefine the given XSD file. The scope of the search is configurable (the current project, a set of local folders, etc.)

If you want to see the references or dependencies of an XML schema, select the desired schema in the **Project** view *(on page 413)* and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

Figure 335. Referenced/Dependent Resources View



The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

Refresh

Refreshes the resource structure.

Stop

Stops the computing.

Show hierarchy for

Computes the hierarchical structure of the references for a resource.

Show dependencies for

Computes the structure of the dependencies for a resource.

Configure dependencies search scope

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

 **Add to Main Files**

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

Tip:
When a recursive reference is encountered in the view, the reference is marked with a special icon .

Note:
The **Move resource** or **Rename resource** actions give you the option to update the references to the resource *(on page 1012)*.

Related Information:
Modular Contextual XML Editing Using 'Main Files' Support *(on page 841)*
Search and Refactor Operations Scope *(on page 843)*

Moving/Renaming XML Schema Resources

You can move and rename a resource presented in the **Referenced/Dependent Resources** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

XML Schema Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

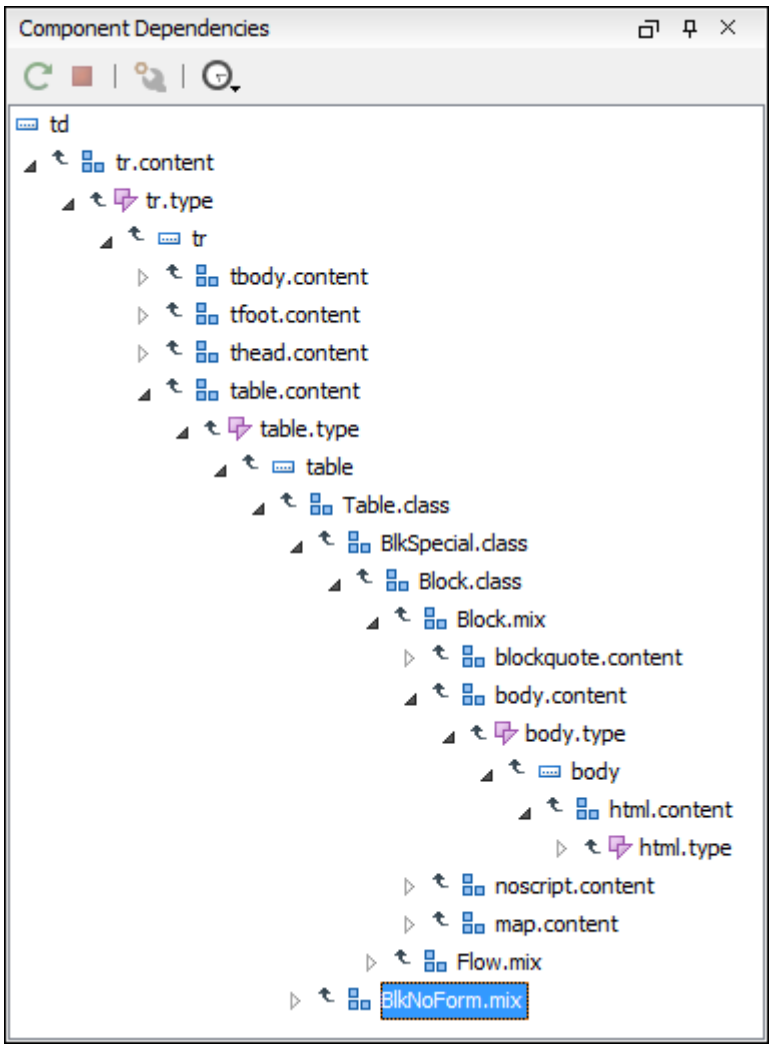
To see the dependencies of an XML Schema component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named components (for example, elements or attributes).

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

Figure 336. Component Dependencies View



The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Search and Refactor Operations Scope *(on page 843)*

Highlight Component Occurrences

When a component (for example types, elements, attributes) is found at current cursor position, Oxygen XML Editor performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document. Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is on by default. To configured it, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **Editor > Mark Occurrences**. A search can also be triggered with the **Search > Search Occurrences in File ()** contextual menu action. All matches are displayed in a separate tab of the **Results** view *(on page 558)*.

Searching and Refactoring Actions in XML Schemas

Search Actions

The following search actions can be applied on `attribute`, `attributeGroup`, `element`, `group`, `key`, `unique`, `keyref`, `notation`, `simple`, or `complex` types and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

Search References

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

Search Declarations

Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

 **Search Occurrences in File**

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

 **Go to Definition**

Moves the cursor to the definition of the referenced XML Schema item.

Note:
You can also use the **Ctrl + Single-Click (Command + Single-Click on macOS)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on `attribute`, `attributeGroup`, `element`, `group`, `key`, `unique`, `keyref`, `notation`, `simple`, or `complex` types and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

 **Rename Component in**

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 337. Rename Identity Constraint Dialog Box

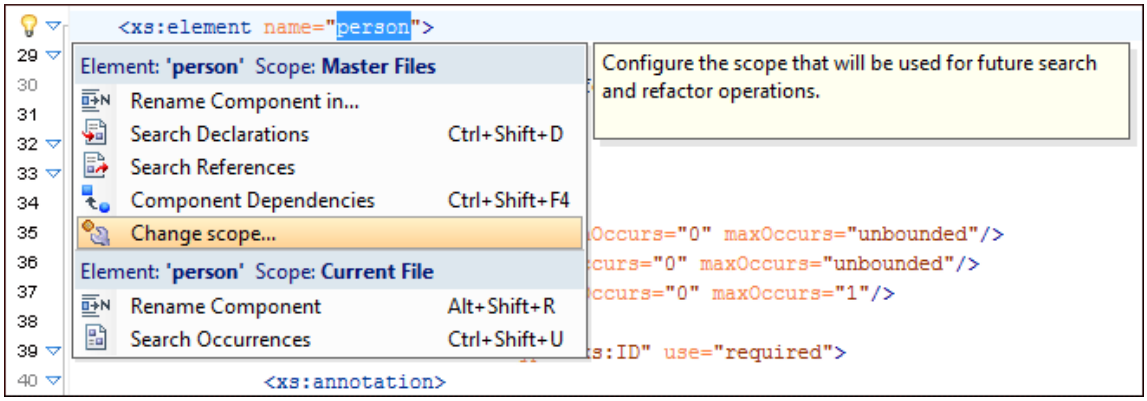
Search and Refactor Operations Scope *(on page 843)*

XML Schema Quick Assist Support

The *Quick Assist* support *(on page 3423)* improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist* feature *(on page 3423)* is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon ( ) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Alt + 1** (**Meta + Alt + 1** on macOS) keyboard shortcuts.

Figure 338. Quick Assist Support



The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Resources

For more information about improving schema development using the **Quick Assist** action set, watch our video demonstration:

Generating Sample XML Files

Oxygen XML Editor offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in **XML Schema** preferences page *(on page 247)*.

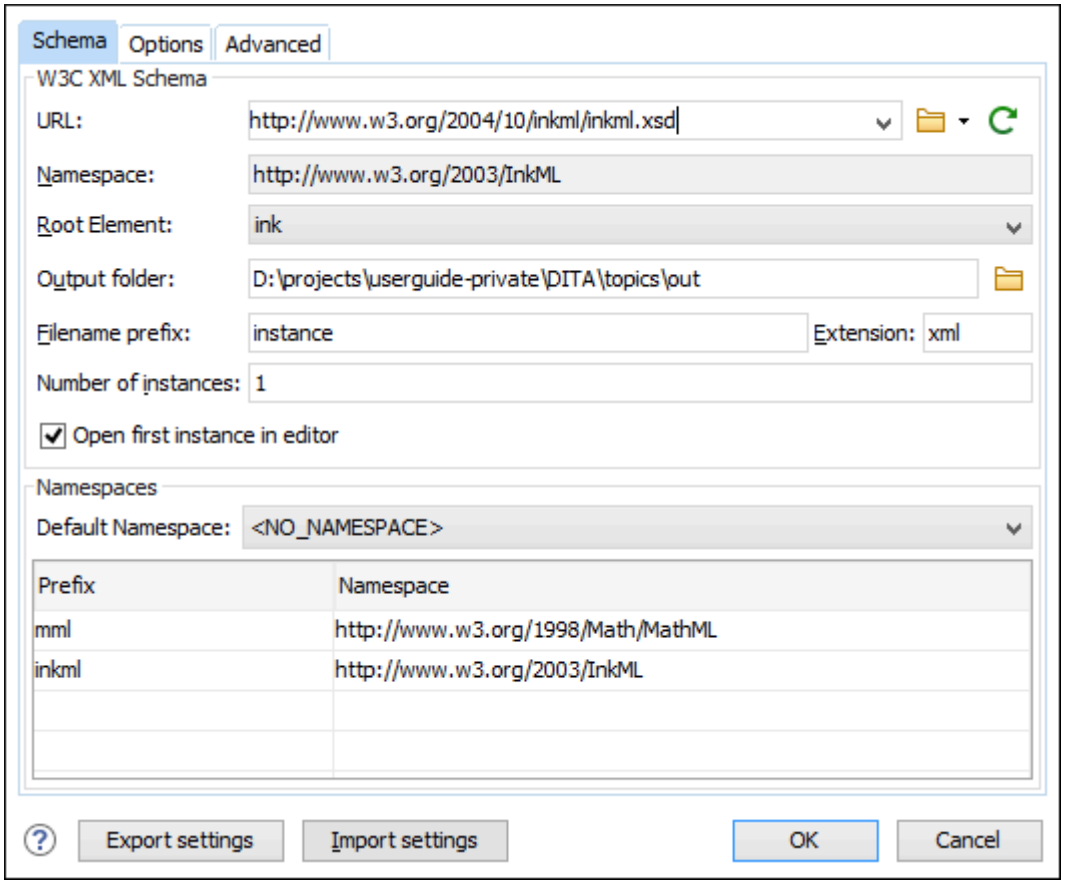
To generate sample XML files from an XML Schema, use the **Generate Sample XML Files** action from the **Tools** menu. This action is also available in the contextual menu of the schema Design mode *(on page 965)*. The action opens the **Generate Sample XML Files** dialog box that allows you to configure a variety of options for generating the files.

The **Generate Sample XML Files** dialog box contains three tabs with various configurable options. Default values for these options can be set in the **Sample XML Files Generator** preferences page *(on page 250)*. You can also run the tool from the command line using exported options.

Schema Tab

The first set of options for the **Generate Sample XML Files** tool are found in the **Schema** tab.

Figure 339. Generate Sample XML Files Dialog Box (Schema Tab)



This tab includes the following options:

URL

Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the **Browse** drop-down list.

Namespace

Displays the namespace of the selected schema.

Root Element

After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

Output folder

Path to the folder where the generated XML instances will be saved.

Filename prefix and Extension

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: `prefixN.extension`, where `N` represents an incremental number from 0 up to the specified **Number of instances**.

Number of instances

The number of XML files to be generated.

Open first instance in editor

When selected, the first generated XML file is opened in the editor.

Namespaces section

You can specify the **Default Namespace**, as well as the prefixes for the namespaces.

Export settings

Use this button to save the current settings for future use.

Import settings

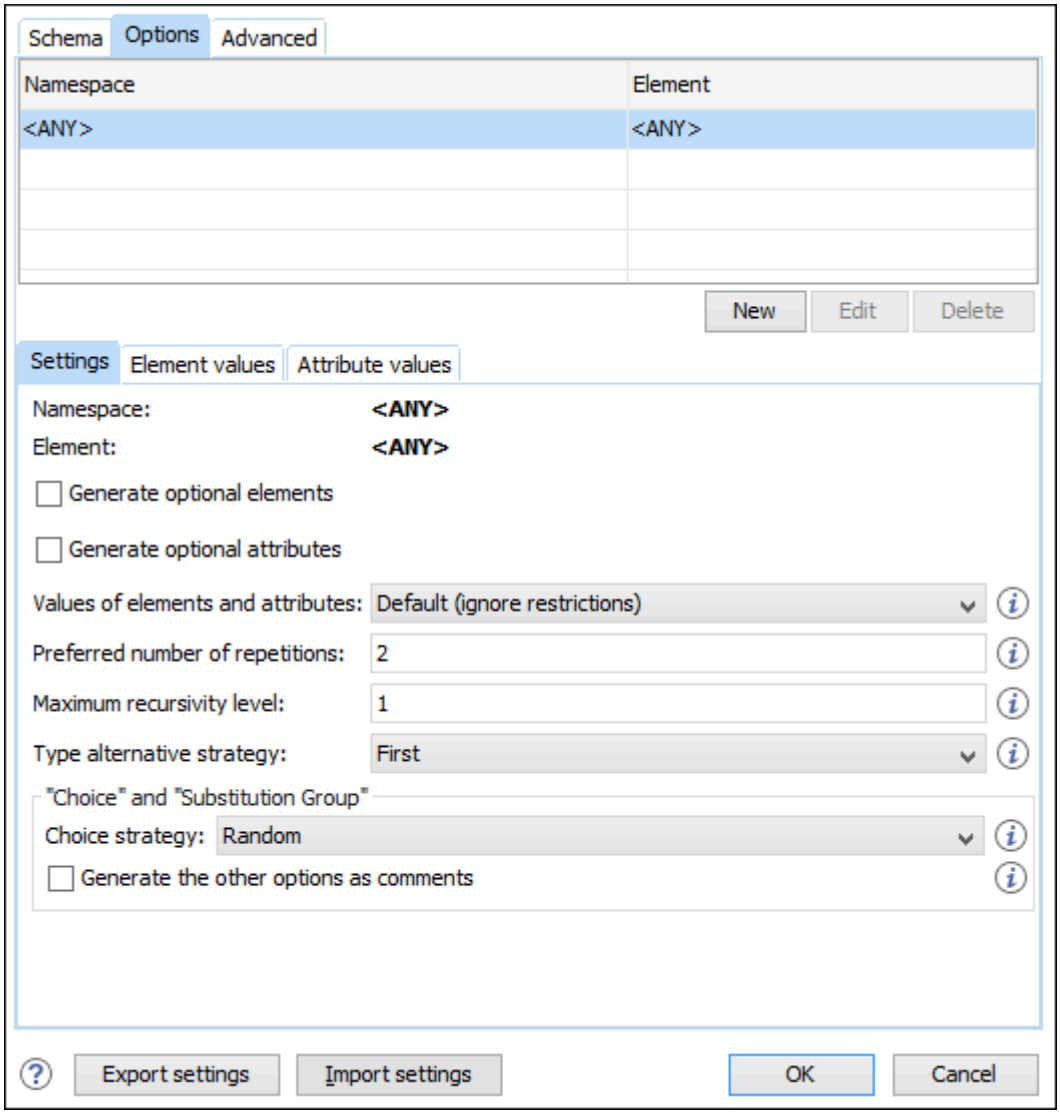
Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Options Tab

The **Options** tab allows you to set specific options for namespaces and elements.

Figure 340. Generate Sample XML Files Dialog Box (Options Tab)



This tab includes the following options:

Namespace / Element table

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces (`<ANY>` - `<ANY>`). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

Settings subtab

Namespace

Displays the namespace specified in the table at the top of the dialog box.

Element

Displays the element specified in the table at the top of the dialog box.

Generate optional elements

When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

Generate optional attributes

When selected, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending on the data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the **Sample XML Files Generator** preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an **xs:string** with the **xs:maxLength** facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending on the data type descriptor of the particular element or attribute.

Important:
If all of the following are true, the **Generate Sample XML Files** tool outputs invalid values:
  - At least one of the restrictions is a `regexp`.
  - The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the `<xs:alternative>` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

Choice strategy

Used for `<xs:choice>` or `<substitutionGroup>` elements. The possible strategies are:

- **First** - The first branch of `<xs:choice>` or the head element of `<substitutionGroup>` is always used.
- **Random** - A random branch of `<xs:choice>` or a substitute element or the head element of a `<substitutionGroup>` is used.

Generate the other options as comments

If selected, generates the other possible choices or substitutions (for `<xs:choice>` and `<substitutionGroup>`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Element values subtab

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

Attribute values subtab

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

Export settings

Use this button to save the current settings for future use.

Import settings

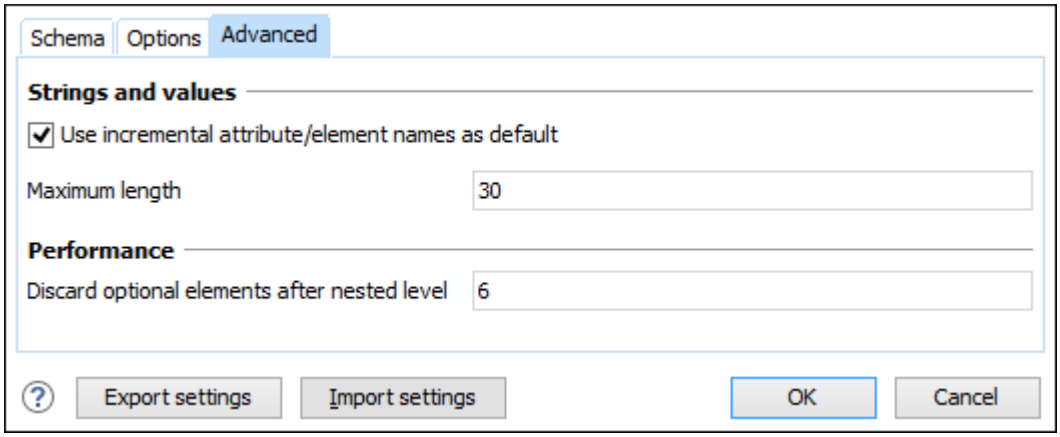
Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Advanced Tab

The **Advanced** tab allows you to set some options regarding output values and performance.

Figure 341. Generate Sample XML Files Dialog Box (Advanced Tab)



This tab includes the following options:

Use incremental attribute / element names as default

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `<a>` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

Tip:
This function can be executed from an automated command-line script, for more details, see Scripting Oxygen *(on page 3383)*.

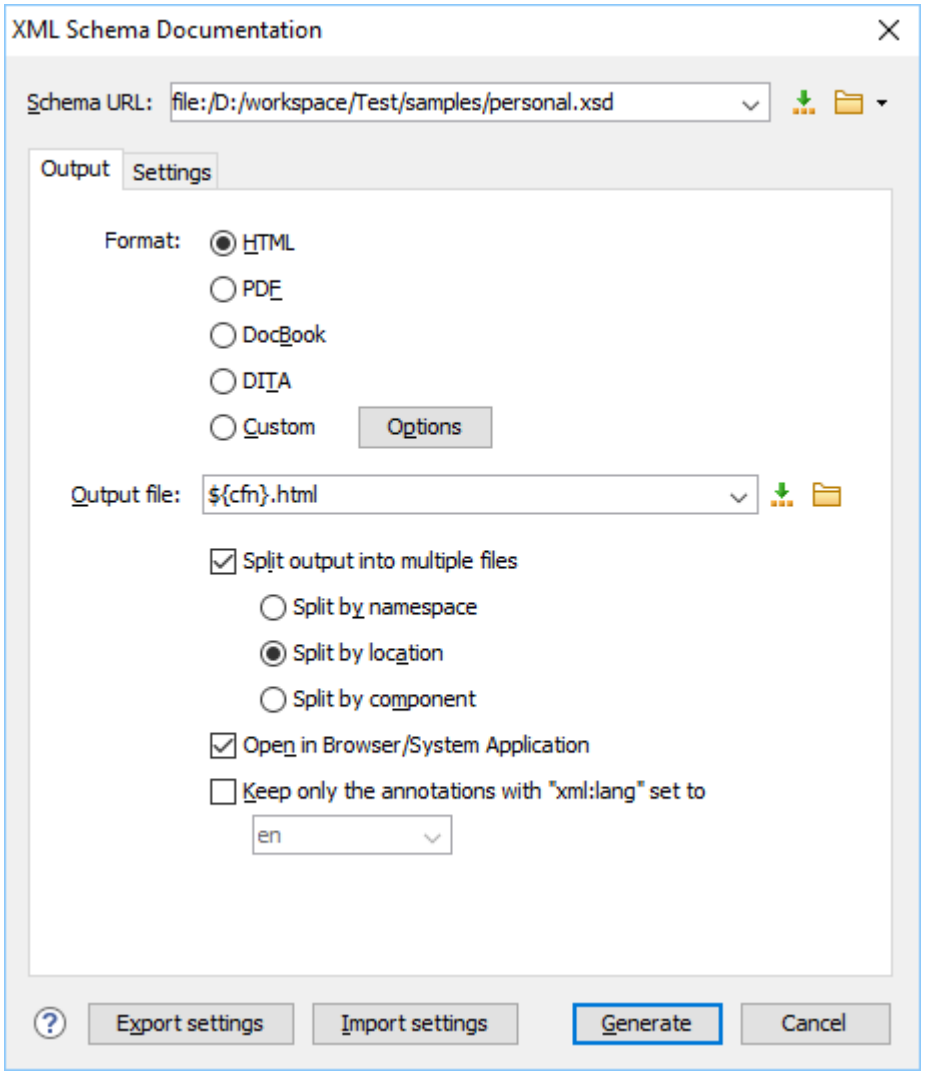
Generating Documentation for an XML Schema

Oxygen XML Editor can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

Note:
You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select **XML Schema Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view *(on page 413)*. You can also open the tool by using the **Generate Documentation** toolbar button.

Figure 342. XML Schema Documentation Dialog Box



The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file that will have documentation generated. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in HTML output format *(on page 1029)*.
  - **PDF** - The documentation is generated in PDF output format *(on page 1032)*.
  - **DocBook** - The documentation is generated in DocBook output format *(on page 1032)*.
  - **DITA** - The documentation is generated in DITA output format *(on page 1032)*.
  - **Custom** - The documentation is generated in a custom output format *(on page 1032)*, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type. For DITA and DocBook documents, this option appears as **Open in Editor** and the result will be opened in Oxygen XML Editor (in the current editor).

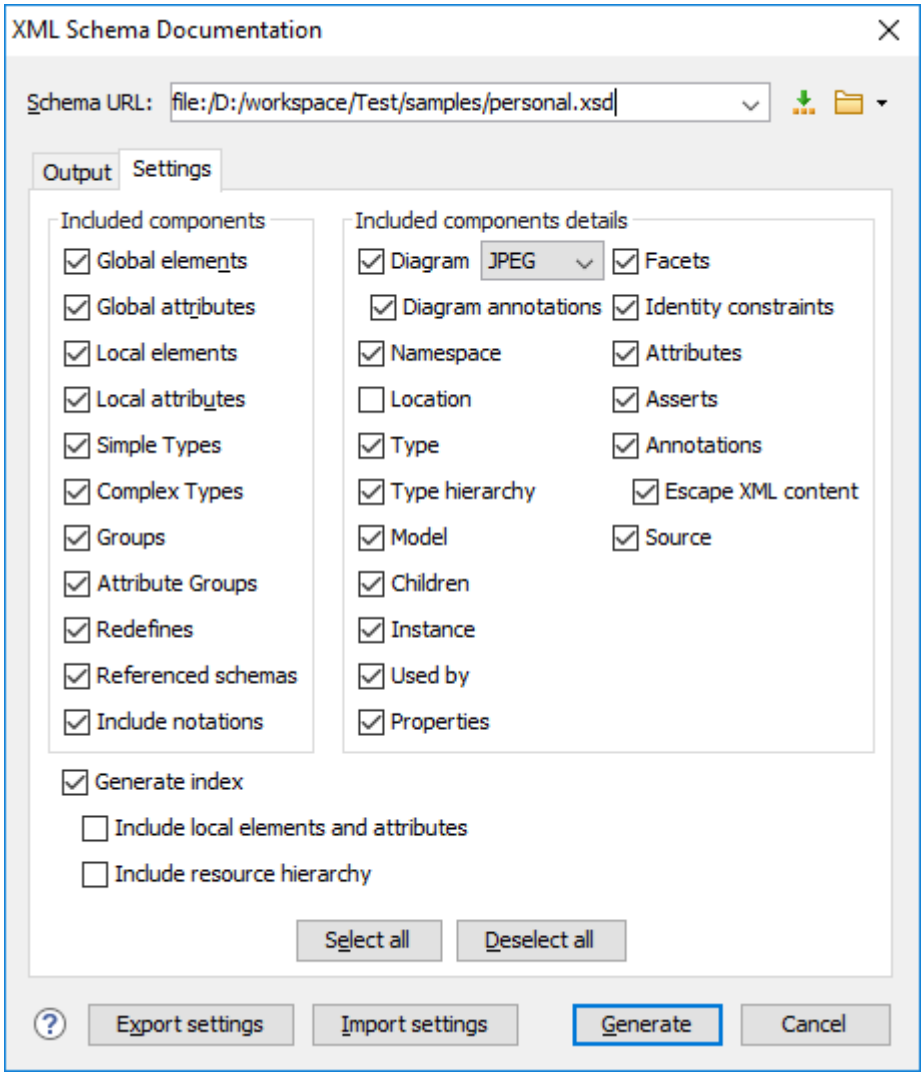
  Note:
  To set the browser or system application that will be used, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*, go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

Settings Tab

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

Figure 343. Settings Tab of the XML Schema Documentation Dialog Box



The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the Schema Design Properties *(on page 206)* page.
- **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.
- **Namespace** - Displays the namespace for each component.
- **Location** - Displays the schema location for each component.
- **Type** - Displays the component type if it is not an anonymous one.
- **Type hierarchy** - Displays the types hierarchy.
- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:

    - **xs:all** - Its children will be separated by space characters.
    - **xs:sequence** - Its children will be separated by comma characters.
    - **xs:choice** - Its children will be separated by | characters.
- **Children** - Displays the list of component's children.
- **Instance** - Displays an XML instance generated based on each schema element.
- **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
- **Properties** - Displays some of the component's properties.
- **Facets** - Displays the facets for each simple type.
- **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
- **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
- **Asserts** - Displays the **assert** elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
- **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.
- **Source** - Displays the text schema source for each component.
- **Generate index** - Displays an index with the components included in the documentation.
    - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
    - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for generating the documentation from the command-line interface).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XML Schema documentation.

Tip:
This function can be executed from an automated command-line script, for more details, see Scripting Oxygen *(on page 3383)*.

Related Information:
Customizing PDF or DocBook Output of Generated XML Schema Documentation *(on page 1033)*

Output Formats for Generating XML Schema Documentation

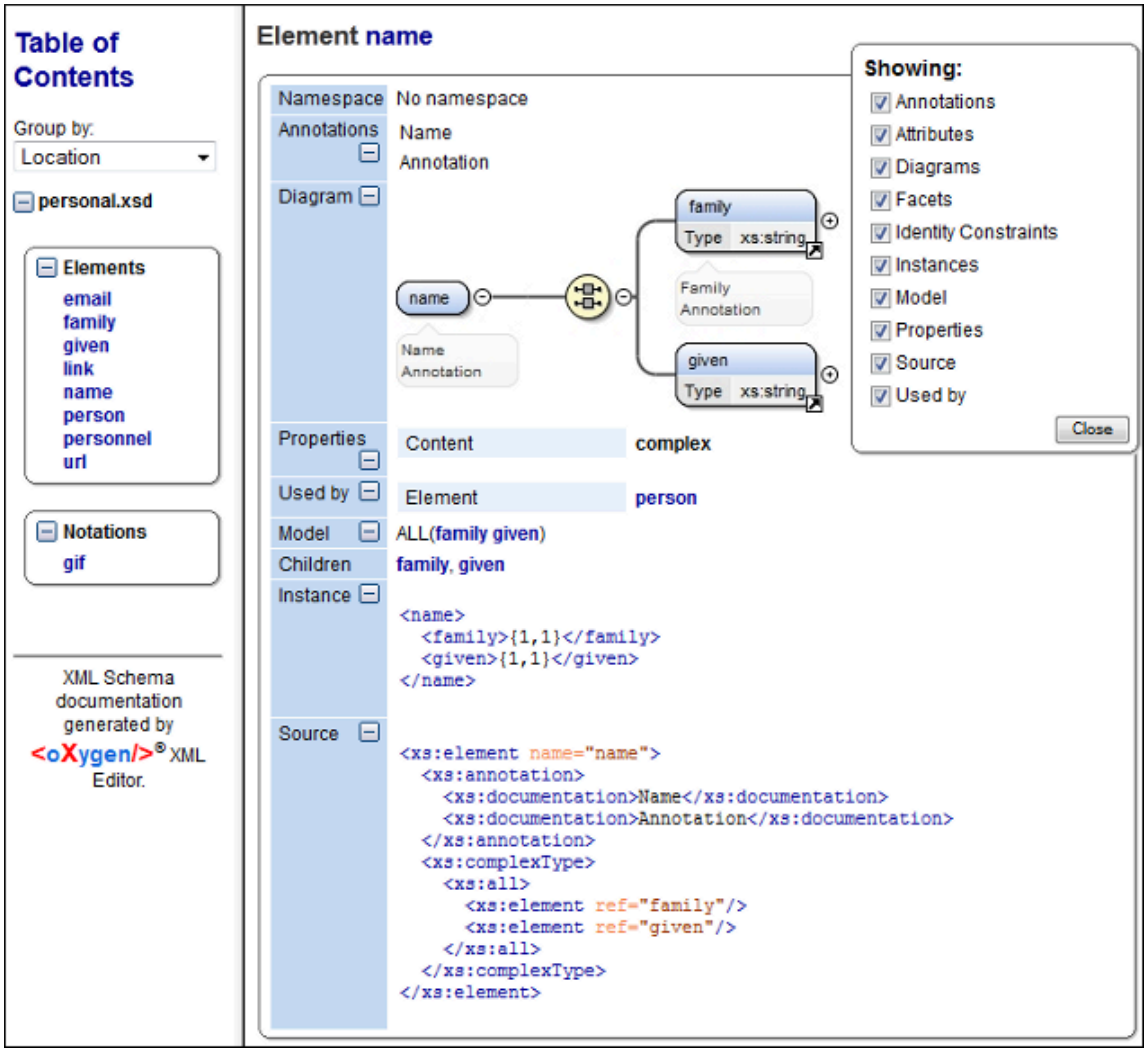
XML Schema documentation can be generated in HTML, PDF, DocBook, or a custom format. You can choose the format from the Schema Documentation *(on page 1024)* dialog box. For the PDF and DocBook formats, the option to split the output in multiple files is not available.

HTML Output Format

The XML Schema documentation generated in HTML format contains images corresponding to the same schema definitions as the ones displayed by the schema diagram editor. *(on page 364)* These images are divided in clickable areas that are linked to the definitions of the names of types or elements. The documentation of a definition includes a **Used By** section with links to the other definitions that reference it. If the **Escape XML Content** option is unchecked, the HTML or XHTML tags used inside the `<xs:documentation>` elements of the input XML Schema for formatting the documentation text (for example, `<b>`, `<i>`, `<u>`, `<ul>`, `<li>`, etc.) are rendered in the generated HTML documentation.

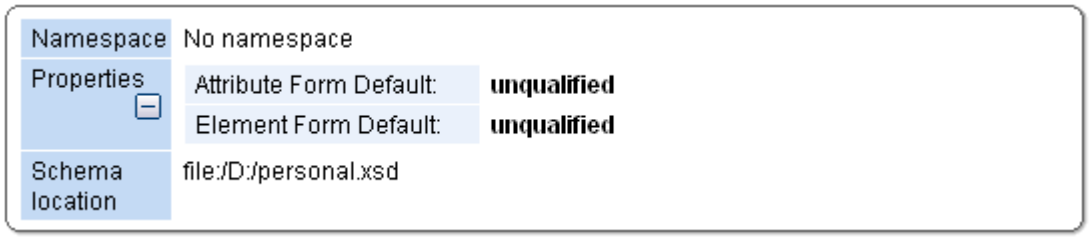
The generated images format is **PNG**. The image of an XML Schema component contains the graphical representation of that component as it is rendered in the schema diagram panel of the Oxygen XML Editor XSD editor panel. *(on page 365)*

Figure 344. XML Schema Documentation Example



The generated documentation includes a table of contents. You can group the contents by namespace, location, or component type. After the table of contents there is some information about the main, imported, included, and redefined schemas. This information contains the schema target namespace, schema properties (attribute form default, element form default, version), and schema location.

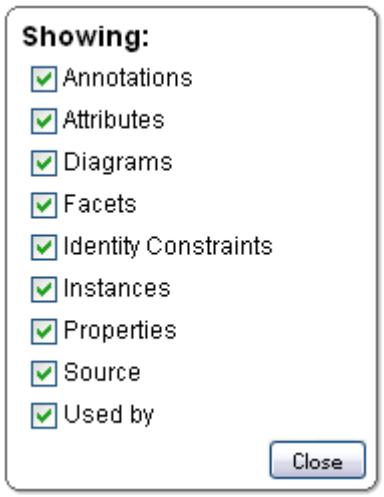
Figure 345. Information About a Schema



If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped in the same mode. If you split the output by location, each file contains a schema description and the components that you have chosen to include. If you split the output by namespace, each file contains information about schemas from that namespace and the list with all included components. If you choose to split the output by component, each file contains information about a schema component.

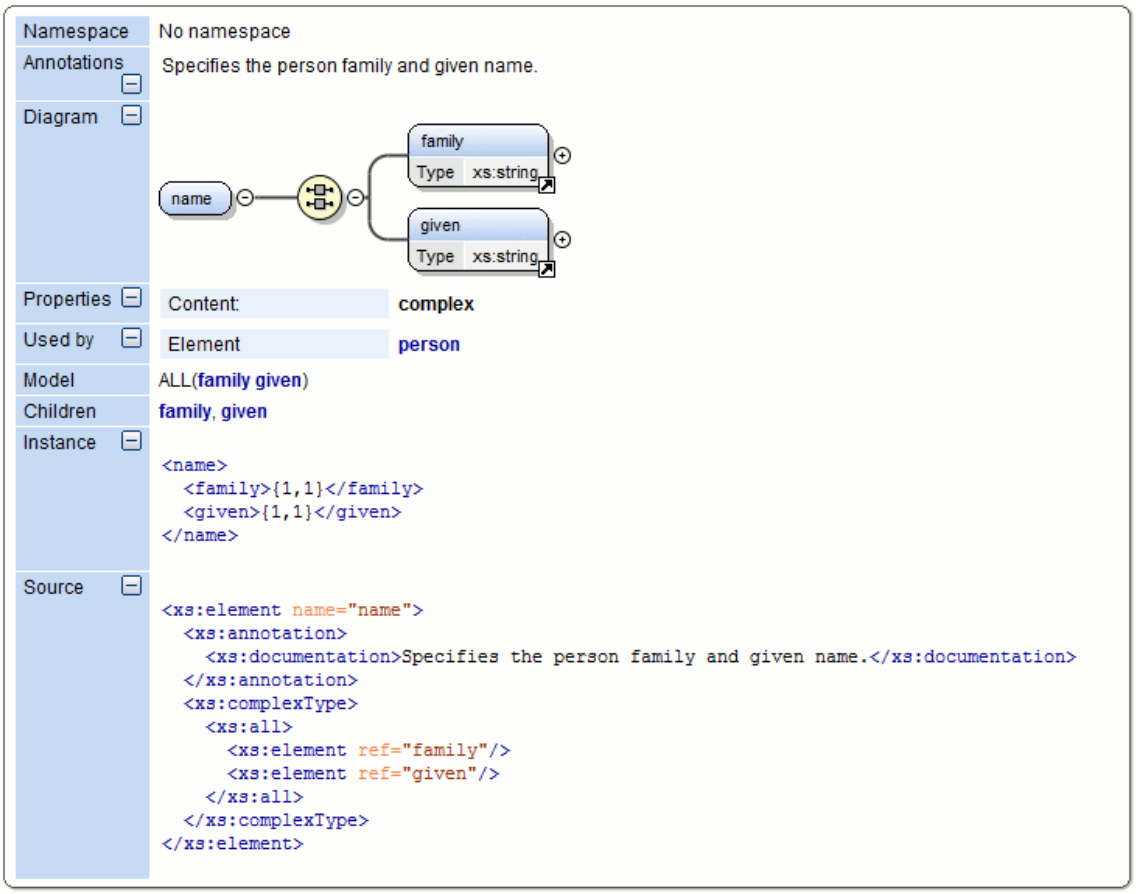
After the documentation is generated, you can collapse or expand details for some schema components by using the **Showing** options or the **Collapse** or **Expand** buttons.

Figure 346. Showing Options



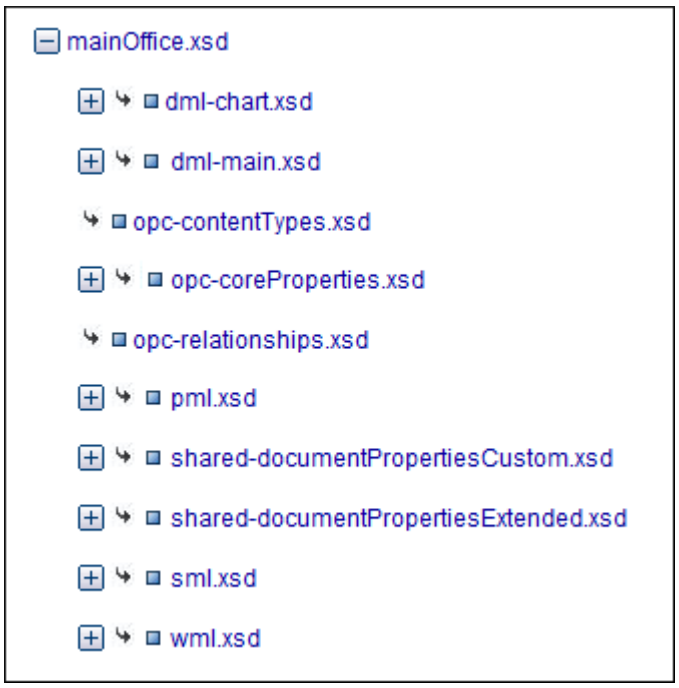
For each component included in the documentation, the section presents the component type follow by the component name. For local elements and attributes, the name of the component is specified as *parent name/component name*. You can easily go to the parent documentation by clicking the parent name.

Figure 347. Documentation for a Schema Component



If the schema contains imported or included modules, their dependencies tree is generated in the documentation.

Figure 348. Example: Generated Documentation



PDF Output Format

For the PDF output format, the documentation is generated in DocBook format and a transformation using the FOP processor is applied to obtain the PDF file. To configure the FOP processor, see the FO Processors *(on page 269)* preferences page.

For information about customizing the PDF output, see Customizing PDF or DocBook Output of Generated XML Schema Documentation *(on page 1033)*.

DocBook Output Format

If you generate the documentation in DocBook output format, the documentation is generated as a DocBook XML file. You can then apply a built-in DocBook transformation scenario *(on page 1499)* (such as, *DocBook PDF* or *DocBook HTML*) on the output file, or configure your own transformation scenario *(on page 1504)* to convert it into whatever format you desire.

For information about customizing the DocBook output, see Customizing PDF or DocBook Output of Generated XML Schema Documentation *(on page 1033)*.

DITA Output Format

If you generate the documentation in DITA output format, each element of the schema is converted to a DITA *Topic* and all the generated topics are referenced in a *DITA map (on page 3419)* file. You can then apply a built-in DITA transformation scenario (such as, *DITA Map PDF* or *DITA Map XHTML*), or configure your own DITA-OT transformation scenario *(on page 1530)* to convert it into whatever format you desire.

For information about customizing the DITA output, see Customizing DITA Output of Generated XML Schema *(on page 1034)*.

Custom Output Format

For the custom format, you can specify a stylesheet to transform the intermediary XML file generated in the documentation process. You have to edit your stylesheet based on the schema `xsdDocSchema.xsd` from `[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation`. You can create a custom format starting from one of the stylesheets used in the built-in HTML, PDF, DocBook, and DITA formats. These stylesheets are available in `[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl`.

When using a custom format you can also copy additional resources into the output folder and choose to keep the intermediate XML files created during the documentation process.

Important:
If you create a custom format for DITA, you must select the **Split output into multiple files** option in the **Output** tab *(on page 1026)* and choose **Split by component**.

Customizing PDF or DocBook Output of Generated XML Schema Documentation

To customize the PDF or DocBook output of the generated XML Schema documentation, use the following procedure:

1. Customize the *[OXYGEN_INSTALL_DIR]*`/frameworks/schema_documentation/xsl/xsdDocDocbook.xsl` stylesheet to include the content that you want to add in the PDF or DocBook output. Add the content in the XSLT template with the `match="schemaDoc"` attribute between the `<info>` and `<xsl:apply-templates>` elements, as commented in the following example:

```
<info>
    <pubdate><xsl:value-of select="format-date(current-date(),
         '[Mn] [D], [Y]', 'en', (), ())"/></pubdate>
</info>
   <!-- Add the XSLT template content with match="schemaDoc" attribute here -->

<xsl:apply-templates select="schemaHierarchy"/>
```

2. Create an intermediary file that holds the content of your XML Schema documentation by following these steps:
    a. Go to **Tools > Generate Documentation > XML Schema Documentation**.
    b. Select **Custom** for the output format and click the **Options** button.
    c. In the **Custom format options** dialog box, do the following:
        i. Enter the customized stylesheet in the **Custom XSL** field (*[OXYGEN_INSTALL_DIR]*`/frameworks/schema_documentation/xsl/xsdDocDocbook.xsl`).
        ii. Select the **Copy additional resources to the output folder** option and leave the default selection in the **Resources** field.
        iii. Click **OK**.
    d. When you return to the **XML Schema Documentation** dialog box, just click the **Generate** button to generate a DocBook XML file with an intermediary form of the Schema documentation.
3. If you want the DocBook file to be transformed into a PDF document, follow these steps:
    a. Use the  **Configure Transformation Scenario(s)** action from the toolbar or the **Document > Transformation** menu, click **New**, and select **XML transformation with XSLT**.
    b. In the **New Scenario** dialog box, go to the **XSL URL** field and choose the *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/oxygen/xsdDocDocbookCustomizationFO.xsl` file.
    c. Go to the **FO Processor** tab and select the **Perform FO Processing** and **XSLT result as input** options.
    d. Go to the **Output** tab and select the directory where you want to store the XML Schema documentation output and click **OK**.
    e. Click **Apply Associated**.

Tip:
If you want your modifications to be permanent so that you can simply select the PDF output format in the **XML Schema Documentation** dialog box, rather than configuring a custom format each time you generate this documentation, follow this procedure:

1. Create a *JAR (on page 3420)* or ZIP file that includes the modified stylesheet (customized in step 1 above), placed in the following directory structure: `builtin/documentation/schema_documentation/xsdDocDocbook.xsl`.
2. Create a new directory named **endorsed** inside the *`[OXYGEN_INSTALL_DIR]`*`/lib` directory and place the created *JAR* or ZIP file inside it.
3. Restart Oxygen XML Editor and the PDF output format will now use your customized stylesheet.

Customizing DITA Output of Generated XML Schema

To customize the DITA output of the generated XML Schema documentation, use the following procedure:

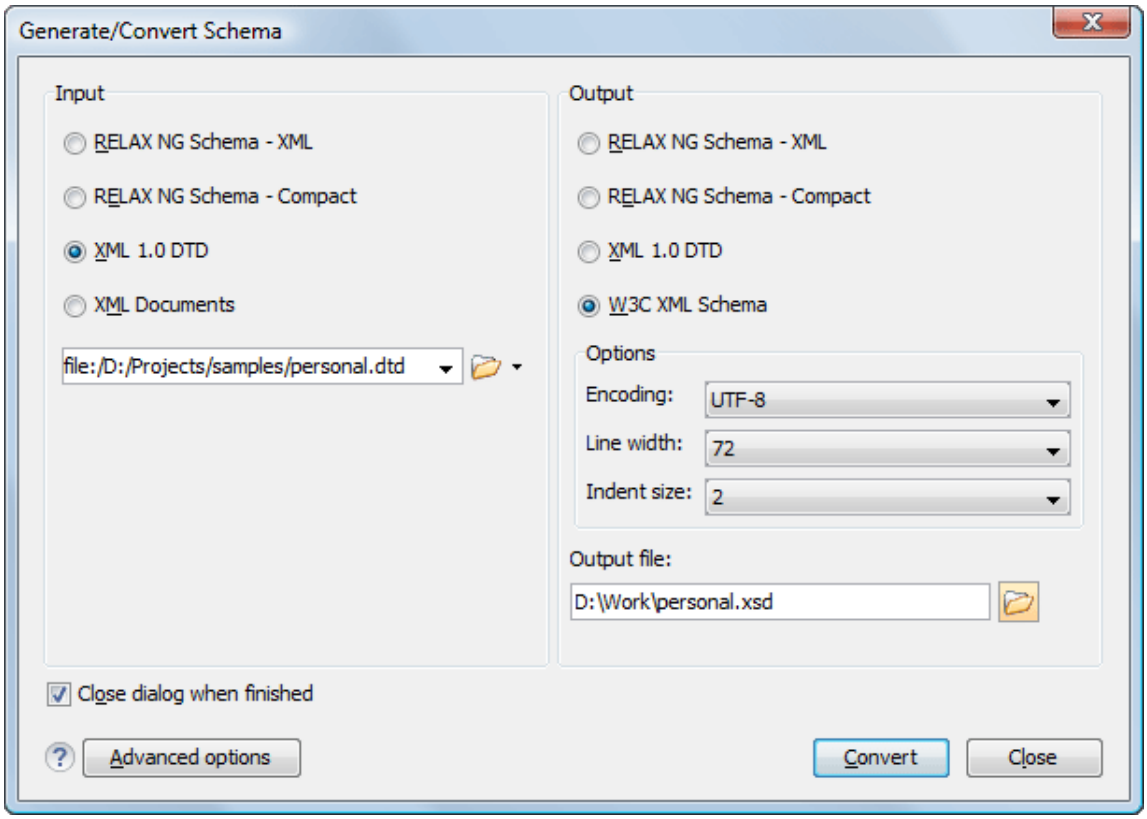
1. Customize the *`[OXYGEN_INSTALL_DIR]`*`/frameworks/schema_documentation/xsl/xsdDocDita.xsl` stylesheet to incorporate your desired changes.
2. Create an intermediary file that holds the content of your XML Schema documentation by following these steps:
    a. Go to **Tools > Generate Documentation > XML Schema Documentation**.
    b. Select **Custom** for the output format and click the **Options** button.
    c. In the **Custom format options** dialog box, do the following:
        i. Enter the customized stylesheet in the **Custom XSL** field (*`[OXYGEN_INSTALL_DIR]`*`/frameworks/schema_documentation/xsl/xsdDocDita.xsl`).
        ii. Select the **Copy additional resources to the output folder** option and leave the default selection in the **Resources** field.
        iii. Click **OK**.
    d. Make sure the **Split output into multiple files** option *(on page 1026)* is selected and choose **Split by component**.
    e. When you return to the **XML Schema Documentation** dialog box, just click the **Generate** button to generate a DITA map file that contains the XML Schema documentation.

Converting Schema to Another Schema Language

The **Generate/Convert Schema** tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor generates an approximation of the source schema. Oxygen XML Editor uses the *Trang multiple format converter* to perform the actual schema conversions.

To use this tool, select the **Generate/Convert Schema (Alt + Shift + C (Command + Option + C on macOS))** action from the **Tools** menu or from the **Open with** submenu when invoking the contextual menu in the **Project** view *(on page 413)*. This action opens the **Generate/Convert Schema** dialog box that allows you to configure various options for conversion.

Figure 349. Generate/Convert Schema Dialog Box



The **Generate/Convert Schema** dialog box includes the following options:

Input section

Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the **XML Documents** option and use the file selector to add the XML files involved in the conversion.

Output section

Allows you to select the language of the target schema.

Options

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

Output file

Specifies the path for the output file that will be generated.

Close dialog when finished

If you deselect this option, the dialog box will remain open after the conversion so that you can easily continue to convert more files.

Advanced options

If you select **XML 1.0 DTD** for the input, you can click this button to access more advance options to further fine-tune the conversion. The following advanced options are available:

XML 1.0 DTD Input section

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.
- **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **annotation-prefix** - Default values are represented using a `@prefix:defaultValue` annotation attribute where prefix is the specified value and is bound to `http://relaxng.org/ns/compatibility/annotations/1.0` as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.
- **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.
- **strict-any** - Preserves the exact semantics of *ANY* content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element
- **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed

as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.
- **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

W3C XML Schema Output section

This section is available if you select **W3C XML Schema** for the output.

- **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.
- **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the `@processContents` attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).
- **any-attribute-process-contents** - Specifies the value for the `@processContents` attribute of `<anyAttribute>` elements. The default is skip (corresponding to RELAX NG semantics).

Converting Database to XML Schema

Oxygen XML Editor includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.

   Result: The **Convert DB Structure to XML Schema** dialog box is opened and your current database connections are displayed in the **Connections** section.
2. If the database source is not listed, click the **Configure Database Sources** button to open the **Data Sources** preferences page *(on page 285)* where you can configure data sources and connections.
3. In the **Format for generated schema** section, select one of the following formats:
   - **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.
   - **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.
4. Click **Connect**.

   Result: The database structure is listed in the **Select database tables** section according to the format you chose.
5. Select the database tables that you want to be included in the XML Schema.
6. If you selected **Hierarchical schema** for the format, you can configure the database columns.

a. Select the database column you want to configure.
b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
c. You can also change the name of the selected database column by changing it in the **Name** text field.

7. Click **Generate XML Schema**.

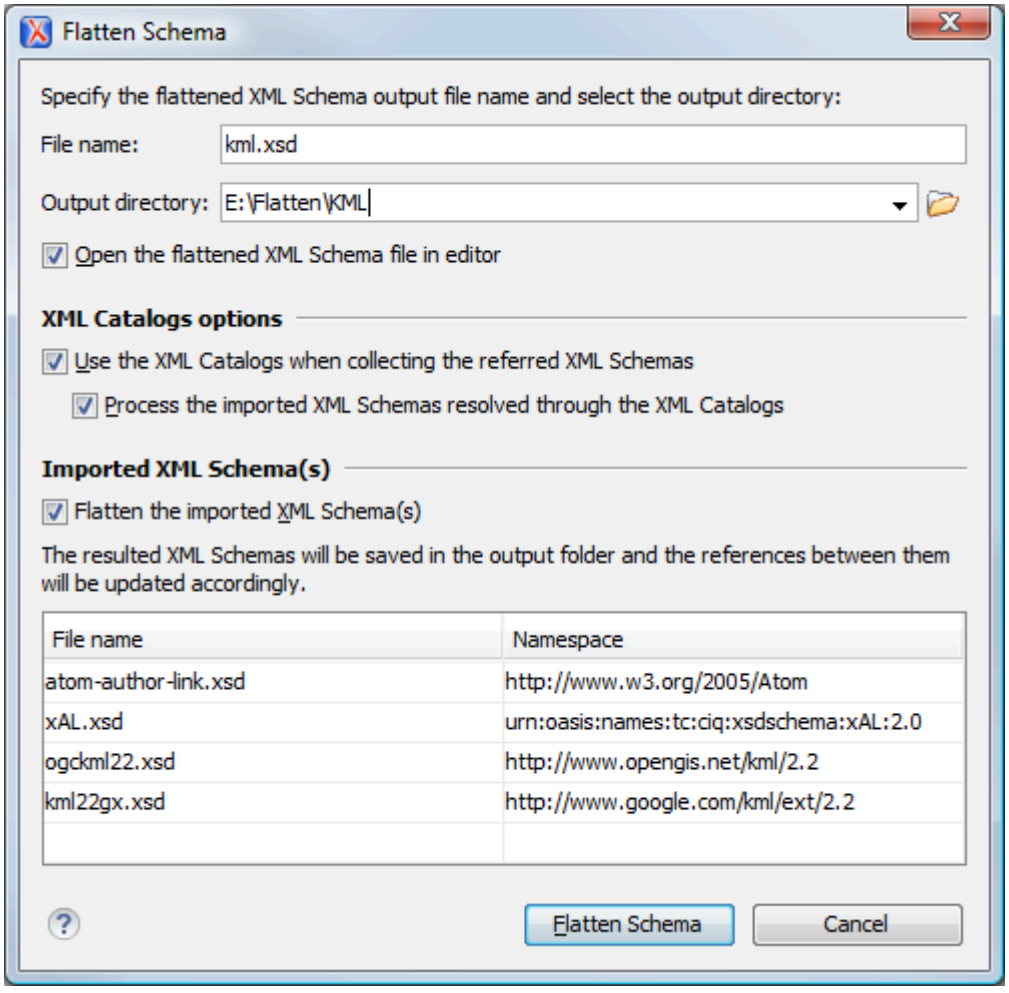
Result: The database structure is converted to an XML Schema and it is opened for viewing and editing.

Flatten an XML Schema

You can organize an XML schema linked by `<xs:include>` and `<xs:import>` statements on several levels. In some cases, working on such a schema as if it were a single file is more convenient than working on multiple files separately. The **Flatten Schema** operation allows you to flatten an entire hierarchy of XML schemas. Starting with the main XML schema, Oxygen XML Editor calculates its hierarchy by processing the `<xs:include>` and `<xs:import>` statements.

The **Flatten Schema** action is available from the **Tools** menu or the contextual menu in **Text** mode. This action opens the **Flatten Schema** dialog box that allows you to configure the operation.

Figure 350. Flatten Schema Dialog Box



For the main schema file and for each imported schema, a new flattened schema is generated in the specified output folder. These schemas have the same name as the original ones.

Note:
If necessary, the operation renames the resulted schemas to avoid duplicated file names.

A flattened XML schema is obtained by recursively adding the components of the included schemas into the main one. This means Oxygen XML Editor replaces the `<xs:include>`, `<xs:redefine>`, and `<xs:override>` elements with the ones coming from the included files.

Options in the Flatten Schema Dialog Box

The following options are available in the **Flatten Schema** dialog box:

File name

The name of the output file.

Output directory

The path of the output directory where the flattened schema file will be saved.

Open the flattened XML Schema file in editor

Opens the main flattened schema in the editing area after the operation completes.

Use the XML Catalogs when collecting the referenced XML Schemas

Enables the imported and included schemas to be resolved through the available *XML Catalogs (on page 3425)*.

Note:
Changing this option triggers the recalculation of the dependencies graph for the main schema.

Process the imported XML Schemas resolved through the XML Catalogs

Specifies whether or not the imported schemas that were resolved through an *XML Catalog (on page 3425)* are also processed.

Flatten the imported XML Schema(s)

Specifies whether or not the imported schemas are flattened.

Note:
For the schemas skipped by the flatten operation, no files are created in the output folder and the corresponding import statements remain unchanged.

Tip:
This function can be executed from an automated command-line script, for more details, see Scripting Oxygen *(on page 3383)*.

Generating Java Classes from XML Schema

Oxygen XML Editor includes a tool for generating Java classes from an XML Schema (XSD) file. The **Generate Java classes from XML Schema (XSD)** action for invoking the tool can be found in the **Tools** menu. It requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor will present a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor and the action will invoke the Java class generator tool.

Quick Installation

You can drag the following **Install** button and drop it into the main editor in **Oxygen** to quickly initiate the installation process:

Install

Manual Installation

To manually install it the add-on, follow these instructions:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste **https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml** in the **Show add-ons from** field or select it from the drop-down menu.

   Note:
   If you have issues connecting to the default update site, you can download the add-on package, unzip it, then use the **Browse for local files** action in the **Install new add-ons** dialog box to locate the downloaded `addon.xml` file.
3. Select the **Java Classes Generator** add-on and click **Next**.
4. Read the end-user license agreement. Then select the **I accept all terms of the end-user license agreement** option and click **Finish**.
5. Restart the application.

Result: The **Generate Java classes from XML Schema (XSD)** dialog box is now available and can be selected from the **Tools** menu.

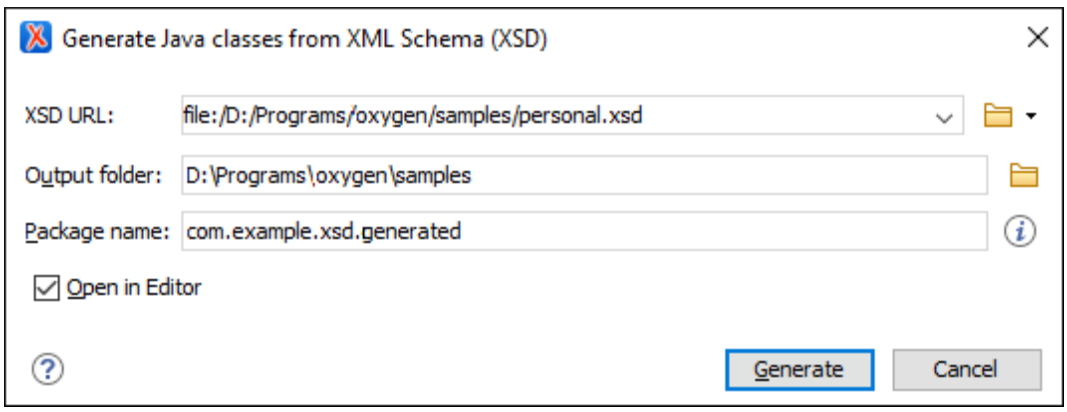
Generating Java Classes

To generate Java classes, follow these steps:

1. Select the **Generate Java classes from XML Schema (XSD)** action from the **Tools** menu.

   Step Result: The **Generate Java classes from XML Schema (XSD)** dialog box is displayed:

   Figure 351. Generate Java Classes from XML Schema (XSD) Dialog Box

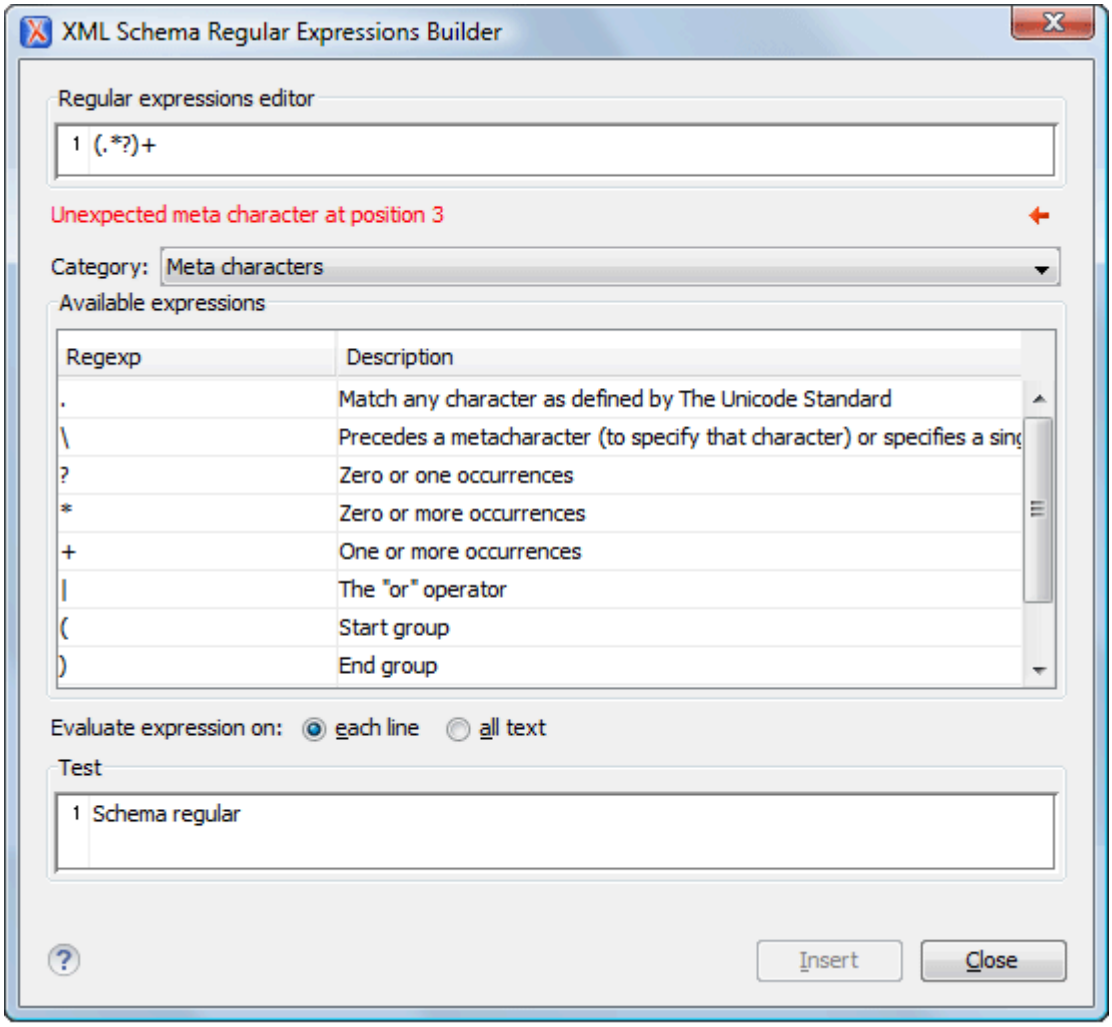
2. Choose or enter the **XSD URL** of the XML Schema document.
3. Choose the path for the **Output folder** where the generated files will be stored.
4. [Optional] You can choose the **Package name** for the Java package that will contain the generated source files. If not specified, the name will be generated based on the value of the `@targetNamespace` attribute.
5. [Optional] You can select the **Open in Editor** option to open the `ObjectFactory.java` file in the editor. This java class contains factory methods for all other classes in the package.
6. Click the **Generate** button.

Result: The Java class files will be generated inside the new package, located in the specified output folder.

XML Schema Regular Expressions Builder Tool

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting **XML Schema Regular Expressions Builder** from the **Tools** menu.

Figure 352. XML Schema Regular Expressions Builder Dialog Box



The dialog box contains the following:

Regular expressions editor

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing **Ctrl + Space**.

Error display area

If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button ( ) highlights the error inside the regular expression.

Category

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the **Available expressions** table.

Available expressions

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous **Category** combo box. You can add an expression in the **Regular expressions editor** by double-clicking the expression

row in the table. You will notice that in the case of **Character categories** and **Block names**, the expressions are also listed in complementary format.

Evaluate expression on

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the **Test** area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

Test

A text editor that allows you to enter a text sample that will have the regular expression applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The **Insert** button will become active when an editor is opened in the background and there is an expression in the **Regular expressions editor**.

The regular expression builder cannot be used to insert regular expressions in the **Grid** mode *(on page 363)* or schema **Design** mode *(on page 364)*. Accordingly, the **Insert** button will be not available if the current document is edited in these modes.

Note:
Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

XML Schema 1.1

Oxygen XML Editor offers full support for XML Schema 1.1, including:

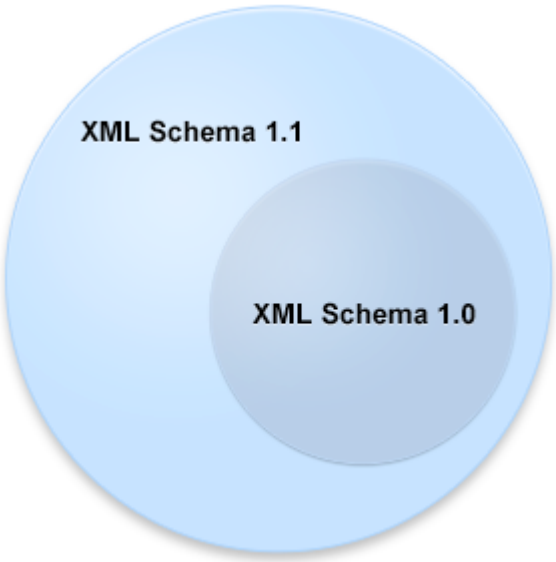
- XML Documents Validation *(on page 784)* and Content Completion *(on page 542)* based on XML Schema 1.1.
- XML Schema 1.1 Validation *(on page 1003)* and Content Completion *(on page 1004)*.
- Editing XML Schema 1.1 files in the Schema **Design** mode *(on page 364)*.
- The Flatten Schema *(on page 1038)* action.
- Referenced/Dependent Resources *(on page 1010)* and Refactoring Actions *(on page 1015)*.
- *Main files (on page 3421)*.
- Generating Documentation for XML Schema 1.1 *(on page 1024)*.
- Support for generating XML instances based on XML Schema.
- Support for validating XML documents with an NVDL schema that contains an XML Schema 1.1 validation step.

Note:
To enable XML Schema 1.1 validation in NVDL, you need to pass the following option to the validation engine to specify the schema version: `http://www.thaiopensource.com/validate/xsd-version` (the possible values are `1.0` or `1.1`.

Tip:
To enable the full XPath expression in assertions and type alternatives, you need to set the `http://www.thaiopensource.com/validate/full-xpath` option.

XML Schema 1.1 is a superset of XML Schema 1.0, that offers lots of new powerful capabilities.

Figure 353. XML Schema 1.1



The significant new features in XSD 1.1 are:

- **Assertions** - Support to define assertions against the document content using XPath 2.0 expressions (an idea borrowed from Schematron).
- **Conditional type assignment** - The ability to select the type of schema an element is validated against, based on the values of the attribute of the element.
- **Open content** - Content models can use the `<openContent>` element to specify content models with *open content*. These content models allow elements not explicitly mentioned in the content model to appear in the document instance. It is as if wildcards were automatically inserted at appropriate points within the content model. A default may be set that causes all content models to be open unless specified otherwise.

To see the complete list with changes since version 1.0, go to http://www.w3.org/TR/xmlschema11-1/#ch_specs.

XML Schema 1.1 is intended to be mostly compatible with XML Schema 1.0 and to have approximately the same scope. It also addresses bug fixes and brings improvements that are consistent with the constraints on scope and compatibility.

Note:
An XML document conforming to a 1.0 schema can be validated using a 1.1 validator, but an XML document conforming to a 1.1 schema may not validate using a 1.0 validator.

If you are constrained to use XML Schema 1.0 (for example, if you develop schemas for a server that uses an XML Schema 1.0 validator that cannot be updated), change the default XML Schema version to 1.0. If you keep the default XML Schema version set to 1.1, the *Content Completion Assistant (on page 3418)* presents XML Schema 1.1 elements that you can insert accidentally in an 1.0 XML Schema. So even if you make a document invalid conforming with XML Schema 1.0, the validation process does not signal any issues.

To change the default XML Schema version, open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)* and go to **XML > XML Parser > XML Schema**.

Resources

For more information about the XML Schema 1.1 support, watch our video demonstration:

https://www.youtube.com/embed/DAkrubQNm0w

Related Information:
Setting the XML Schema Version *(on page 1045)*

Setting the XML Schema Version

Oxygen XML Editor lets you set the version of the XML Schema you are editing either in the **XML Schema** preferences page, or through the versioning attributes. If you want to use the versioning attributes, set the *minVersion* and *maxVersion* attributes, from the *http://www.w3.org/2007/XMLSchema-versioning* namespace, on the *schema* root element.

Note:
The versioning attributes take priority over the XML Schema version defined in the preferences page.

Table 36. Using the *minVersion* and *maxVersion* Attributes to Set the XML Schema Version

Versioning Attributes	XML Schema Version
minVersion = "1.0" **maxVersion** = "1.1"	1.0
minVersion = "1.1"	1.1
minVersion = "1.0" **maxVersion** = greater than "1.1"	The XML Schema version defined in the **XML Schema** preferences page *(on page 247)*

Table 36. Using the *minVersion* and *maxVersion* Attributes to Set the XML Schema Version (continued)

Versioning Attributes	XML Schema Version
Not set in the XML Schema document	The XML Schema version defined in the **XML Schema** preferences page *(on page 247)*

To change the XML Schema version of the current document, use the **Change XML Schema version** action from the contextual menu. This is available both in the **Text** mode, and in the **Design** mode and opens the **Change XML Schema version** dialog box. The following options are available:

- **XML Schema 1.0** - Inserts the *minVersion* and *maxVersion* attributes on the *schema* element and gives them the values "1.0" and "1.1" respectively. Also, the namespace declaration (*xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning*) is inserted automatically if it does not exist.
- **XML Schema 1.1** - Inserts the *minVersion* attribute on the *schema* element and gives it the value "1.1". Also, removes the *maxVersion* attribute if it exists and adds the versioning namespace (*xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning*) if it is not declared.
- **Default XML Schema version** - Removes the *minVersion* and *maxVersion* attributes from the *schema* element. The default schema version, defined in the **XML Schema** preferences page, is used.

Note:
The **Change XML Schema version** action is also available in the informative panel presented at the top of the edited XML Schema. If you close this panel, it will no longer appear until you restore Oxygen XML Editor to its default options.

Oxygen XML Editor automatically uses the version set through the versioning attributes, or the default version if the versioning attributes are not declared, when proposing content completion elements and validating an XML Schema. Also, the XML instance validation against an XML Schema is aware of the versioning attributes defined in the XML Schema.

When you generate sample XML files from an XML Schema, Oxygen XML Editor takes into account the *minVersion* and *maxVersion* attributes defined in the XML Schema.

Editing XQuery Documents

XQuery is the query language for XML and is officially defined by a W3C Recommendation document. Oxygen XML Editor provides support for XQuery 3.1, which is also backwards compatible with XQuery 3.0 and 1.0.

The many benefits of XQuery include:

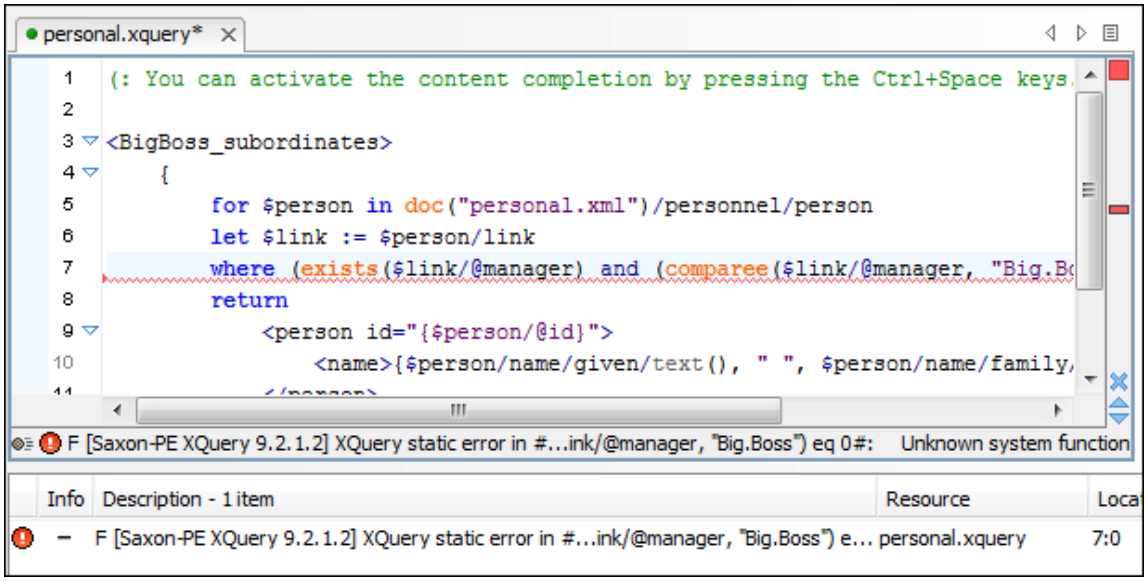
- XQuery allows you to work in one common model no matter what type of data you are working with: relational, XML, or object data.
- XQuery is ideal for queries that must represent results as XML, to query XML stored inside or outside the database, and to span relational and XML sources.
- XQuery allows you to create many different types of XML representations of the same data.
- XQuery allows you to query both relational sources and XML sources, and create one XML result.

Related Information:
XQuery and Databases *(on page 2185)*

XQuery Validation

With Oxygen XML Editor, you can validate your documents before using them in your transformation scenarios. The validation uses the Saxon 12.3 PE, EE, or HE processor, or you can use some database engines (such as MarkLogic or eXist) if you installed them. Any other XQuery processor that offers an XQJ API implementation *(on page 2175)* can also be used. This is in conformance with the XQuery Working Draft. The processor is used in two cases: validation of the expression and execution. Although the execution implies a validation, it is faster to check the expression syntactically, without executing it. The errors that occurred in the document are presented in the messages view at the bottom of editor window, with a full description message. As with all error messages, if you click an entry, the line where the error appeared is highlighted.

Figure 354. XQuery Validation



Note:
If you choose a processor that does not support XQuery validation, Oxygen XML Editor displays a warning when trying to validate.

The **Validation options** button, available in the **Document > Validate** menu, allows quick access to the XQuery options *(on page 262)* in the Oxygen XML Editor preferences.

When you open an XQuery document from a connection that supports validation (for example, MarkLogic, or eXist), by default Oxygen XML Editor uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation resolves imports better.

Content Completion in XQuery

Oxygen XML Editor provides content completion for keywords and all known XQuery functions and operators. The *Content Completion Assistant (on page 3418)* can be manually activated with the **(Ctrl + Space)** shortcut. The functions and operators are presented together with a description of the parameters and functionality, depending on the validation or transformation engine.

For some supported database engines such as MarkLogic and eXist, the content completion list offers the specific XQuery functions implemented by that engine. This feature is available when the XQuery file has an associated transformation scenario that uses one of these database engines or the XQuery validation engine is set to one of them via a validation scenario or in the XQuery Preferences *(on page 262)* page. For more information about the support for working with XQuery with regard to databases, see XQuery and Databases *(on page 2185)*.

The extension functions included in the Saxon engine are available on content completion if one of the following conditions are true:

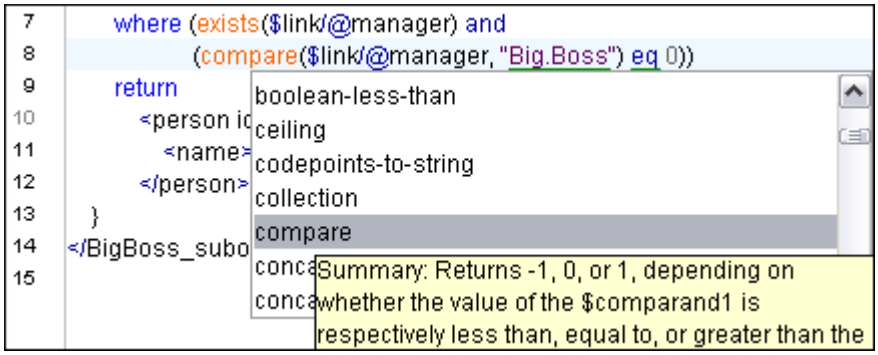
- The edited file has a transformation scenario associated that uses as transformation engine Saxon 12.3 PE or Saxon 12.3 EE.
- The edited file has a validation scenario associated that use as validation engine Saxon 12.3 PE or Saxon 12.3 EE.
- The validation engine specified in Preferences *(on page 262)* is Saxon 12.3 PE or Saxon 12.3 EE.

If the Saxon namespace (http://saxon.sf.net) is mapped to a prefix, the functions are presented using this prefix. Otherwise, the default prefix for the Saxon namespace (`saxon`) is used.

If you want to use a function from a namespace mapped to a prefix, just type that prefix and the content completion displays all the XQuery functions from that namespace. When the default namespace is mapped to a prefix, the XQuery functions from this namespace offered by content completion are also prefixed. Otherwise, only the function name being used.

The content completion pop-up window presents all the variables and functions from both the edited XQuery file and its imports.

Figure 355. XQuery Content Completion



Syntax Highlighting in XQuery

Oxygen XML Editor supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XQuery files, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(on page 131)*.
2. Go to **Editor > Syntax Highlight** *(on page 233)*.
3. Select and expand the **XQuery/XPath** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

Customize Syntax Highlight colors *(on page 233)*

Formatting and Indenting XQuery Documents

Editing XQuery documents may lead to large chunks of content that are not easily readable by human audience. Also, each developer may have a particular way of writing XQuery code. Oxygen XML Editor assists you in maintaining a consistent code writing style with the **Format and Indent** action that is available in the **Document > Source** menu and also on the toolbar..

The **Format and Indent** action achieves this by performing the following steps:

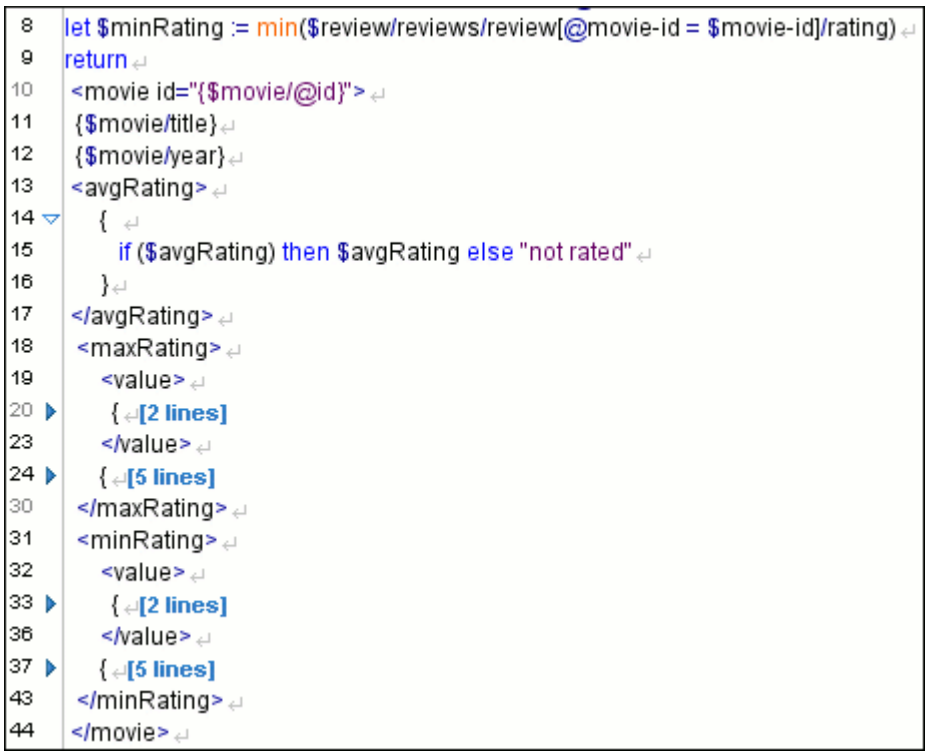
- Manages whitespaces, by collapsing or inserting space characters where needed.
- Formats complex expressions on multiple, more readable lines by properly indenting each of them. The amount of whitespaces that form an indent unit is controlled through one of the **Indent with tabs** and **Indent size** options from the **Format Preferences** page *(on page 210)*.

Note:
These operations can be performed only if your XQuery document conforms with XQuery 1.0, 3.0, 3.1, or XQuery Update Facility 1.0 specifications. If the *Format and Indent* operation fails, the document is left unaltered and an error message is presented in the **Results** view *(on page 558)*.

Folding in XQuery Documents

In a large XQuery document, the instructions enclosed in the '{' and '}' characters can be collapsed so that only the needed instructions remain in focus. The same folding features available for XML documents *(on page 538)* are also available in XQuery documents.

Figure 356. Folding in XQuery Documents



There is available the action **Go to Matching Bracket Ctrl + Shift + G (Command + Shift + G on macOS)** on contextual menu of XQuery editor for going to matching character when cursor is located at '{' character or '}' character. It helps for finding quickly matching character of current *folding element (on page 3420)*.

XQuery Outline View
